Biographic, attitudinal, and performance data will be compiled from airman record files on yearly input of male and female enlistees (1970-1975). Criterion data of special interest will include disciplinary actions, APRs, unsuitability discharges medical data (if available) and reenlistment. Particular attention will be directed to areas where male and female performance is disparate and to factors which may be related to early separation prior to completion of initial tour of duty. Where sample size is sufficient for meaningful interpretation, analyses will be accomplished by AFSC. Distributional, correlational and regression analyses will be accomplished. Milestones - generation of data base, Nov 76-Sep 77, 11 mos, computer analyses, Oct 77-Apr 78, 7 mos, interpretation of data, May 78-Sep 78, 5 mos, preparation of final report, Oct 78-Jan 79, 4 mos, TR clearance and reproduction, Feb 79-May 79, 4 mos.

6.0011, DEVELOPMENT OF THE PMS ENLISTED PJM

J.C. Fast, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Brooks Air Force Base, San Antonio, Texas* 78235 (DF234240)

To develop a classification model that provides the same set of logical processes to be used in the pre-enlistment and post-enlistment phases of an airman's career. As a part of this, a policy system will be developed which calculates the appropriateness of assigning specific people to specific jobs vis-a-vis their contemporaries. Research started under work unit 20770401 and continued under 20770407 will be used as a basis for the work done under this work unit.

The methodology developed under 20770407 will be used to completely define a pipeline management system (PMS) enlisted PJM policy. An initial policy will be implemented using all the new variables identified previously. AFHRL will assist AFMPC in the implementation of this model and will continue to consult throughout the life of the work unit on operational problems. An algorithm for selection of candidates for HRP screening will be developed using data previously gathered by AFMPC. This algorithm will become part of the post enlistment classification system and will be used to enhance PJM. A simulation technique will be developed to allow managers to look at proposed policy changes and assess the impact on the operational system. AFHRL will continue to analyze the PJM history file to determine the effectiveness of PJM. Milestones - development of initial PMS policy (1 May 79), incorporation of new variables into PMS (1 Jul 79), assist in implementation process (as required), development of policy simulation (30 Jun 80), development of algorithm for assessment (1 Jul 79), final product (31 Oct 81).

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0012, SCREENING OF PROSPECTIVE AIR TRAFFIC CONTROLLER OPERATORS
J.C. Quebe, U.S. Dept. of Defense, Air Force, Human Resources Lab., *Brooks Air Force Base, San Antonio, Texas* 78235 (DF233970)

To develop a controller oriented screening device for air traffic control (ATC) applicants. Present requirements are AQE score of 60 or better in administrative or general and a Class II physical exam (including ARMA), neither of which appear to be positive indicators of eventual success in the air traffic control field.

Analyzing the results from a 1975 FAA exam administered to ATC (27230) students at Keesler and of AQE scores, against performance in the ATC field, determine what factors in test batteries are predictive of success in the career field. Develop new screening device based upon the prediction parameters and employing current and advanced testing technology.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Human Resources Lab.

6.0013, TEST AND EVALUATION OF CHEMICAL DEFENSE EQUIPMENT & EXTREME CHANGES IN COCKPIT ENVIRONMENT
R.W. Krutz, U.S. Dept. of Defense, Air Force, School of Aerospace Medicine, *Brooks Air Force Base, San Antonio, Texas* 78235 (DF322610)

Previous efforts in this area were documented under work unit 7930-09-15. The purpose of this effort is to conduct in-house test and evaluation of chemical defense personal equipment in direct support to the 412A life support SPO, chemical defense division (AEL). The work unit is structured to address biomedical and environmental test requirements that are expected to arise during various stages of new equipment development and modification of existing equipment by the SPO. The capability to conduct quantitative leakage assessment of CD respiratory devices will be established and the chemical properties of CD filter materials will be studied for their compatibility with the flight environment. The justification for establishing this supportive effort is based upon an approved memorandum of agreement between AMD and ASD/AEL (30 Jun 76), and TAF (ROC) 326-75, 7 Nov 75 (CW mask for tactical fighter aircrew). The MOA states that T&E support will be provided on a cost reimbursement basis, the latter defined as a specific cost schedule in AMD letter to ASD/AEL, 9 Feb 76.

The work unit monitor will serve as the OPR for the CD program to be accomplished within the USAFSAM. He will plan programs and coordinate all T&E activities to be accomplished by various organizations within the laboratory. However, laboratory elements at both the USAFSAM and AMRL will charge against this work unit to insure proper reimbursement. Specific areas of test and environmental simulation will consist of altitude exposure, including pressure breathing levels and rapid decompression, respiratory impedance measurements, thermal/cold effects, air combat manuevering (ACM) g exposures, mask leakage characteristics, equipment related performance decrement, and integration with other life support equipment and cockpit configurations. Realistic operational profiles for the environmental conditions will be simulated and the sodium chloride cloud technique will be utilized for lead testing purposes (actual CW agents, simulants or antidotes will not be used for any tests). The OPR and others will also provide biomedical consultation and review technical requirements for equipment design when requested.

SUPPORTED BY U.S. Dept. of Defense, Air Force, School of Aerospace Medicine

6.0014, CREW UTILIZATION AND WORKLOAD ASSESSMENT FOR MAXIMUM OPERATIONS
W.F. Storm, U.S. Dept. of Defense, Air Force, School of Aerospace Medicine, *Brooks Air Force Base, San Antonio, Texas* 78235 (DF325010)

Both strategic and tactical operations impose unique stresses and workloads on USAF air and ground crewmen. This work unit examines and evaluates crew fatigue, physiologic cost, and performance effectiveness during standard, contingency, and maximum effort operations such as long range/nonstop deployments, sortie surges, airborne and ground based C3 operations, low level/high speed ACM, and all-weather rescue operations. Guidelines for operational commanders on stress/fatigue loads and their effects on performance and safety are presented as crew utilization recommendations for use in planning and operational practice. Special emphasis is given to defining post-mission/post-duty rest and recovery requirements for single and repetitive missions/duty periods.

Currently established psychobiological and performance measurement methods are applied systematically to evaluate and scale crew effects of single and multiple operational stresses in order to identify optimized mission workloads and crew duty cycles. The current battery of field measurements includes subjective fatigue, mood, and activity questionnaires, biochemical analyses of urine samples for neuroendocrine and metabolic indices, and human factors engineering and workload evaluations. When appropriate and feasible, other psychobiological measures, such as temperature and heart rate, are also obtained. Other laboratories and scientific literature are constantly monitored for new and improved methods which may serve to better evaluate man/machine effectiveness in USAF operations. Laboratory studies complement field studies, providing for better controlled means of evaluating new performance and physiological tests for eventual field use and for validating data collected under the uncontrolled conditions of real world operations. Previous efforts now assigned to this work unit were ongoing under 79301002, 79301004, 79301005, and 79301020. Performance and physiological data collected in an inhouse laboratory study involving long duration missions in GAT-1 trainers is undergoing analysis and preliminary report preparation. A unique information processing task shows promise for adaptation to field studies. Crew fatigue data have been collected on 2 F-4 sortie surges, and a similar surge involving A-10s will be studied in mid-August. Evaluations of C3 operator fatigue will be conducted. (Text Abridged)

7.0001, FORMAL TRANSFORMS ARISING IN GEOMETRIC QUANTIZATION
R.J. Blattner, University of California, Los Angeles Campus, School of Letters & Science, Dept. of Mathematics, *405 Hilgard Ave., Los Angeles, California* 90024 (MCS78-01332)

This continues research under MCS 7517621 A01.

Blattner will continue his work on geometric quantization by working on four problems. 1. Developing an indefinite Hodge theory adequate to describe the metaplectic representation of U(k,1). 2. Extending the half-form pairing to nonpositive polarizations using sheaf cohomology. 3. Understanding Rawnsley's nonunitary pairing arising in the 'Kepler problem.' 4. Extension of Kostant's pairing of symplectic spinors to the non-transverse case.

John H. Rawnsley will collaborate with Blattner on (1), (2) and (3) for three months.

7.0002, DEVELOPMENT OF NEW CENTRIFUGE CONTROL ALGORITHMS
R.J. Crosbie, U.S. Dept. of Defense, Navy, Naval Air Development Center, Aircraft & Crew Systems Tech Directorate, *Warminster, Pennsylvania* 18974 (DN081187)

To investigate and establish criteria which will be used in the development of new algorithms for controlling the human centrifuge as a dynamic flight simulator. The current method of

controlling the centrifuge during dynamic flight simulations produces unrealistic and often undesirable angular artifacts to the simulator pilot. The proposed method will seek to minimize these angular artifacts and will provide a continuing benefit in optimizing the centrifuge control for all future centrifuge programs prior to their implementation.

An existing simulation, which includes mathematical models of the centrifuge, a generic aircraft, and an aircraft/centrifuge conversion network, will be used as it is excited by various simulated pilot inputs. By comparing human sensory response, both simulated and actual, to the dynamic environment of the simulated aircraft and the centrifuge, new centrifuge control algorithms will be developed which will minimize undesirable artifacts. When the simulated system is judged to be of optimum control, it will be incorporated into the actual aircraft/centrifuge conversion network and be validated through manned testing.

8.0001, MODERN SPECTROSCOPY AND COLLISION STUDIES OF FUNDAMENTAL ATOMIC AND MOLECULAR SYSTEMS

W.H. Wing, University of Arizona, School of Liberal Arts, Dept. of Physics, *Tucson, Arizona* 85721 (PHY77-15217 A02)

Research is proposed on three problems in modern spectroscopy of fundamental atomic and molecular systems. In the first project, a recently developed ion-beam infrared-laser resonance apparatus will be used to perform extremely high-resolution spectroscopy and collision measurements on the hydrogen molecular ion. In the second project, precise microwave-optical spectroscopic and collision studies will be made on highly excited helium atoms. Both these systems represent three-body problems fundamental to the understanding of atomic and molecular structure. In both cases the precision achievable is several orders of magnitude greater than is achievable by conventional optical spectroscopy.

The first project has the additional potential to improve knowledge of fundamental contrasts, especially mass ratios, and also will be extended to include other ions important in astrophyics, quantum chemistry, and high-temperature gaseous and plasma processes.

In the third problem theoretically predicted and recently observed velocity-dependent sharp features in the helium-neon excitation transfer process responsible for laser action, and the velocity dependence of metastable and Rydberg helium-normal helium collisions, will be studied by a computerized time-of-flight method.

This work is a continuation of that currently supported under NSF grant number PHY75-03549A02.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0002, EXPERIMENTAL STUDY OF ELECTRON-MOLECULE (ATOM) COLLISION PROCESSES

S. Trajmar, U.S. National Aeronautics & Space Admin., Jet Propulsion Lab., Physics Section, *4800 Oak Grove Dr., Pasadena, California* 91103 (INT76-22192)

This collaborative research project involves Dr. Sandor Trajmar of the Jet Propulsion Laboratory (Pasadena, California), with Drs. Sergio Porto, George Csanak, and Dimitrios Bozinis of the University of Campinas (Campinas, Brazil).

NSF is contributing to the linkage of these scientists for the purposes of expanding their research efforts in electron-molecule (atom) collision physics. The joint research efforts will be concentrated in areas which are of importance from the point of view of laser and plasma physics, isotope separation, and surface chemistry and physics. Three specific research areas have been chosen: a) Electron scattering from atomic and molecular beams. This will involve experimentation with lasers in metal vapors, and vibrational excitation of diatomic and polyatomic molecules. b) Isotope separation. Exploratory research on isotope separation through combinations of laser photoexcitation followed by selective photoionization or chemical reactions will be carried out. c) Electron scattering from surfaces. Here planning and feasibility studies will be done to utilize low- and intermediate-energy elastic and inelastic electron scattering for probing surfaces.

The laboratory measurements will be carried out at JPL by the two main investigators from each country. The evaluation and interpretation of the results will be shared and carried out at Campinas and JPL, and will be closely correlated with ongoing theoretical work at Campinas under Dr. Csanak.

8.0003, BASIC RESEARCH IN PLASMA PHYSICS

N. Rynn, University of California, Irvine Campus, School of Physical Sciences, Dept. of Physics, *Irvine, California* 92664 (PHY78-07816)

This research project will study certain basic properties of hot, full-ionized gasses (plasmas). An experimental and theoretical investigation of turbulent diffusion and transport across a magnetic field is proposed. The experimental program will use an extension of previously developed laser diagnostics to probe the density and the temperature of the plasma both in space and time. The development of the optical diagnostic techniques is discussed in detail. It is also proposed to investigate instabilities caused by anisotropic velocity distributions, parametric decay and excitation of ion cyclotron waves, plasma filamentation and the coherence of modes and 'clump' theory. All of these programs overlap at at least one point.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Physics

8.0004, MULTICRITICAL POINT BEHAVIOR

G.E. Everett, University of California, Riverside Campus, School of Natural & Agricultural Sciences, Dept. of Physics, *Riverside, California* 92502 (DMR77-11323 A01)

The research will employ detailed high resolution magnetization measurements for investigations of 'multi-critical' behavior in iron and europium selenide. It has been shown, using renormalization group techniques, that cubic ferromagnetic iron is equivalent to the theoretical Pott's model. Mean-field analysis has predicted several anomalous multicritical points for various directions of an applied magnetic field. Magnetization components parallel and perpendicular to the applied field will be measured versus field and temperature in single crystal samples in order to test these theoretical predictions.

Multicritical point-like behavior is also observed in EuSe for one field direction. A line of critical points which is required by symmetry considerations but which has not yet been observed will be investigated with high resolution experiments. The existence of multicritical behavior associated with other field directions and the dependence on uniaxial stress will also be investigated.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0005, FUNDAMENTAL PROCESSES IN PLASMAS

J.H. Malmberg, University of California, San Diego Campus, Graduate School, Dept. of Physics, *P.O. Box 109, La Jolla, California* 92037 (PHY77-20613 A01)

The research will include both theory and experiment and emphasize problems in plasma physics for which very precise experimental tests of theory can be obtained. Most of the experiments will be done with an important new type of plasma--an unneutralized, magnetically confined electron gas. Such plasma can be made by simple methods and contained for minutes, with the effects of both classical and anomalous transport clearly ob-

served. The first objective is to understand this transport in detail. A second objective is to increase the plasma confinement time until the electrons come to thermal equilibrium with each other. A third objective is to decrease the plasma temperature and increase the plasma density until electron-electron correlations become strong. One can speculate that if this development succeeds, the electron gas will liquify, and at very low temperature freeze into a crystal.

The research on the TWT experiment will also continue. The next objective for this work is to observe the 'explosive instability.' This class of instability has been predicted theoretically but has never been directly observed experimentally.

This work is a continuation of that currently supported under NSF grant number PHY73-05125A03.

8.0006, MEASUREMENTS OF THE ORDERED PHASES OF SOLID HELIUM-3

J.M. Goodkind, University of California, San Diego Campus, Revelle College, Dept. of Physics, *La Jolla, California* 92093 (DMR78-23974)

Research was previously supported by DMR7721014.

A Superconducting Quantum Interference Device (SQUID) will be used to study the spin-ordered state of solid helium-3. Nuclear cooling techniques will be used to extend specific heat and nuclear magnetic resonance measurements to ultra-low temperatures. Successful acquisition of these data will help in the identification of the nature of the spin-ordered states of solid helium-3.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0007, MICROSCOPIC STUDY OF LOW-LYING EXCITATIONS IN SUPERFLUID 3HE AND SUPERCONDUCTORS

K. Maki, University of Southern California, School of Letters Arts & Sciences, Dept. of Physics, *3551 University Ave., Los Angeles, California* 90007 (DMR76-21032 A01)

This is a continuation and extension of research started under NSF grant DMR74-23429. The basic thrust is to study the theory of dynamical properties of superfluid 3He and superconductors from a completely microscopic point of view. Specific problems under study are: 1.) Nonlinear Dynamics of Superfluid 3He - The basic equation governing the spin motion in superfluid 3He-A and B in the absence of dissipation has been derived. Explicit solutions of physical relevance remain to be found. 2.) Dissipation Phenomena in Superfluid 3He - A formulation of the transport coefficients in superfluid 3He-B has been developed. Of further interest is the effect of dissipative terms on the nonlinear spin-orbital dynamics of superfluid 3He. 3.) Surface Phenomena in Superfluid 3He - The magnetic coupling as well as the acoustic coupling between liquid 3He and magnetic or nonmagnetic substance will be studied. 4.) Low-Lying Excitations in Superconductors - Of particular interest are the fluctuation of the order parameter in the clean type II superconductor, and that in the type I superconductor far below the transition temperature. 5.) Dynamics of Superconductors with Periodic Substructures - The interaction between the periodic substructure and the vortex lattice will be examined and the effect of periodicity on the basic superconducting properties will be studied.

8.0009, NUCLEAR ACOUSTIC RESONANCE IN METALS

R.G. Leisure, Colorado State University, School of Natural Sciences, Dept. of Physics, *Fort Collins, Colorado* 80523 (DMR76-11117 A01)

The study of atomic motions in solids and how they influence the behavior of nuclear magnetic spins is an area of considerable interest in condensed matter science. The interaction between acoustic waves and nuclear spins will be investigated in several metals. Preliminary results on sodium will be extended in order to determine the mechanism responsible for coupling the acoustic energy to the nuclear spins in this material. The resonant attenuation of acoustic waves due to this mechanism (nuclear acoustic resonance) will then be studied near the temperature of the sodium martensitic phase transition. Previous nuclear acoustic resonance experiments on lead will be extended to a single-crystal lead-indium alloy. The absence of electric quadrupole effects on the lead resonance makes possible a particularly clean study of isotropic and anisotropic knight shifts. Careful nuclear acoustic resonance intensity measurements will be made in aluminum in the temperature-magnetic field range for which the Hall field vanishes. Preliminary results indicate a need for a revision of the dipolar coupling theory. A new class of nuclear acoustic resonance experiments will be explored. These experiments involve the concept of adiabatic demagnetization in a rotating reference frame.

This research was previously supported under NSF grant DMR-7611117.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0010, SUPERCONDUCTING AND NORMAL ELECTRICAL PROPERTIES OF ANISOTROPIC AND ION IMPLANTED MATERIALS

W.C. Moulton, State University System of Florida, Florida State University, School of Arts & Sciences, Dept. of Physics, *205 Wildwood Dr., Tallahassee, Florida* 32306 (DMR78-21612)

Research initiated under grant DMR 7610845 will be continued and extended. Although the proposed program represents a single research effort involving a study of strong-coupled superconductors, detailed investigations will be performed in three somewhat diverse areas: 1) the hexagonal tungsten bronzes, 2) the layered dichalcogenides, and 3) ion-implanted samples of transition metal elements and compounds. Work with the bronzes will emphasize materials preparation and measurements of electrical resistance, Hall coefficient and Seebeck voltages. The objective of this work is a detailed study of compositional and ion-size effects upon a suspected high temperature phase transition and its relationship to the occurrence of high transition temperatures in these superconducting compounds. Studies concerned with the dichalcogenides and ion-implanted systems will concentrate on the effects which magnetic-ion additions have on the normal state and superconducting state properties of the host matrix. A newly commissioned vibrating magnetometer will provide additional data with regard to the magnetic state of these compounds. A superconducting solenoid will be used to extend studies of the field dependence of the Hall coefficient and magnetoresistance to magnetic field values as high as 5T. This work will yield essential data about the magnetic inter-

actions occuring in these compounds and their effects upon the technologically important parameters of the superconducting state.

This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0011, AN EPR-ENDOR STUDY OF EXOELECTRON EMISSION TRAPS IN CERAMIC AND SINGLE CRYSTALLINE BERYLLIUM OXIDE

A.K. Garrison, Emory University, Graduate School, Dept. of Physics, *1364 Clifton Rd. N.E., Atlanta, Georgia* 30322 (DMR77-00314 A01)

Continuation of research supported under DMR75-03281.

Electron nuclear double resonance (ENDOR) will be used to characterize the traps involved in exoelectron emission (EE) in the crystalline and ceramic forms of BeO which have been previously exposed to ionizing radiation. Since thermally stimulated EE (TSEE) is the basis for a sensitive radiation dosimeter made from ceramic BeO, the aim of the study is not only to increase the understanding of the basic EE processes but also to aid in the development of a more reliable TSEE detector.

Initial ENDOR studies done by the co-principal investigators have shown that lithium is present in the BeO ceramic dosimeter material at levels at least two orders of magnitude above that previously known. It serves as a charge trap and may be the primary trap in the exoelectron and luminescence processes. Once all the paramagnetic traps are characterized by ENDOR, it is proposed to use the ENDOR signals as unique microscopic probes into the role of these traps in the EE processes. This will be done by combining ENDOR measurements with TSEE and thermoluminescence (TL) readout, optical stimulation of the traps, various radiation and annealing treatments, electron paramagnetic resonance (EPR) kinetic studies and electric conductivity measurements.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0012, DEEP LEVEL DEFECTS IN SEMICONDUCTORS

S. Sundaram, University of Illinois, Chicago Circle Campus, School of Liberal Arts & Sciences, Dept. of Physics, *601 S. Morgan St., Chicago, Illinois* 60680 (DN875661; N00014-78-C-0732)

The operation of solid state electron devices used in Navy electronics systems is controlled by the electronic nature of impurity atoms incorporated in the semiconductor materials. Deep level impurities do not contribute directly to the material conductivity but affect carrier lifetime and recombination proceses. Such impurities and their effects are not understood and must be investigated for improving solid state devices.

Studies will be made of the electronic properties of deep level defects in gallium arsenide (GaAs) and indium phosphide (InP) produced by impurities such as chromium and iron. Photoluminescence measurements with and without uniaxially applied stress will be made to deduce the valence states and resultant energy levels of the impurity. Theoretical models based on crystal field theory will be developed to correlate predictions of luminescent intensities, and energy of deep levels with the experimental results. Various valence states will be considered, configuration mixed representations of the multi-electron systems will be used, and crystal symmetry models for various possible impurity configurations in the lattice will be included in the analysis.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

8.0013, TIME RESOLVED SPECTROSCOPY OF THE ELECTRON-HOLE LIQUID IN SEMICONDUCTORS

J.P. Wolfe, University of Illinois, Urbana Champaign Campus, School of Engineering, Dept. of Physics, *207 Engineering Hall, Urbana, Illinois* 61801

At low temperatures, the photoexcited states of the semiconductors silicon and germanium may be simply described as classical particles. A gas of 'excitons,' bound electron-hole pairs analagous to hydrogen atoms, produces 'excitonic molecules,' analagous to molecular hydrogen (H2), and may further condense to a (non-classical) metallic liquid phase. These particles disappear when the excitation light is removed. Recombination times (100 ns-1 ms) are determined by time-resolved spectroscopy, and basic properties of these photoexcited states will be determined by temperature-, stress-, and density-dependences of their lifetimes.

8.0014, QUANTUM LIQUIDS IN TWO AND THREE DIMENSIONS

J.M. Mochel, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Physics, *Urbana, Illinois* 61801 (DMR78-11538)

This is a continuation of work sponsored under DMR-7203291. An experimental study will be made of 4He between 10mK and 1K. An investigation of the properties of ultra thin films will be made by means of third sound resonance. The behavior of surface impurities of 3He as a two-dimensional Fermi gas, using the closed surface of 4He films as the substrate, will be studied. A new method of time-of-flight phonon spectroscopy in bulk 4He both with and without 3He impurities will be examined. This work is important to understanding the physics of quantum fluids.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0015, COMPARATIVE MULTICRITICAL POINT MEASUREMENTS ON ORDERED AND DISORDERED MATERIALS

M.B. Salamon, University of Illinois, Urbana Champaign Campus, School of Liberal Arts & Sciences, Dept. of Physics, *Urbana, Illinois* 61801 (DMR78-07763)

In Condensed Matter Science, there are many materials in which there are competing interactions. These materials generally are expected to have complex and interesting phase diagrams. In ordered materials such as metamagnets, the competition leads to a change in the nature of the phase transition from second to first order at a special point called the tricritical point. In randomly disordered systems, the nature of the magnetic state changes completely, giving rise to the spin-glass phase. Experimental detail on the nature of these phase transitions, is sparse. Experiments will be carried out on pure metamagnets, randomly diluted metamagnets, and magnetically random metallic glasses to fill the gap between experimental results and theoretical predictions. To do this it is necessary to measure thermodynamic properties and magnetic properties simultaneously because of the need to correct accurately for demagnetizing effects. Simultaneous critical point measurements will be made, using Faraday rotation to provide the needed magnetization data. These experiments will test existing theories of the multicritical point of metamagnets and explore the effect of randomness on the multicritical point. They will provide a new approach to the spin-glass problem by studying the evolution of the spin-glass phase from the magnetically ordered state as the degree of randomness is increased. This can provide new understanding of the magnetic behavior of non-crystalline materials.

This research was previously supported under DMR-7610379.

This is the first year of a three-year continuing grant.

8.0019, MOLECULAR BEAM, HYDROGEN MASER, AND STORED ATOM RESEARCH

N. Ramsey, Harvard University, Cambridge Campus, School of Arts & Sciences, Dept. of Physics, *Cambridge Station, Cambridge, Massachusetts* 02138 (PHY77-13938 A01)

High-precision molecular beam magnetic resonance apparatus will continue to be used to study internal orientation-dependent interactions in molecules, such as nuclear electric quadrupole, nuclear spin-rotational and spin-spin magnetic interactions. Primary emphasis will be on non-polar molecules. The dependence of the electric and magnetic susceptibilities on molecular orientation and rotational distortion parameters of molecules will also be studied. Measurements of similar orientation-dependent interactions in polar molecules will be studied with a new molecular beam electric resonance apparatus which combines an unusually high precision electric resonance apparatus with a strong magnetic field. Atomic hydrogen masers will be studied and improved. Major improvements can be expected for a large storage box hydrogen maser with deformable walls, which has just recently come into operation. Hydrogen masers will be used to obtain more accurate values of the hyperfine separation and the effect of an electric field upon the hyperfine separation. Experiments with other stored atoms will be carried out by various methods including the hydrogen maser spin exchange technique.

This work represents a continuation of that currently supported by Foundation grant MPS-7412429.

8.0020, MEASUREMENT OF TROPOSPHERIC UV FLUXES AS RELATED TO DEFINITION OF HYDROXYL FREE RADICAL ATMOSPHERIC CONCENTRATIONS

F.B. Sellers, Panametrics Inc., Radiation Physics, *221 Crescent St., Waltham, Massachusetts* 02154 (ATM76-23902 A01)

The GAMETAG program is providing the first set of coordinated measurements of trace atmospheric gases over a wide geographic area. Simultaneous solar UV fluxes are being measured for analysis of GAMETAG data by instruments provided and operated by Panametrics, Inc. These measurements and the subsequent data are crucial for calculations of photodissociation rates and excited species photoproduction rates, which are essential parameters for interpretation of GAMETAG results for concentrations of species such as OH and O3. This grant provides for continuation of the solar UV flux measurements and data reduction for the GAMETAG program. Downward fluxes in the 280-400 nm region are measured and reported in 10 bands varying from 2 t0 20 nm in width. Upward fluxes are measured with broad band Eppley pyranometers to assess effects of backscattered UV on photodissociation processes.

8.0021, THEORETICAL STUDIES OF THE QUANTUM LIQUIDS AND SOLIDS

R.A. Guyer, University of Massachusetts, Amherst Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Amherst, Massachusetts* 01002 (DMR76-14447 A01)

Work begun under NSF grant DMR76-14447 will be continued and extended. Theoretical studies of quantum solids and fluids will be undertaken with special emphasis on helium-3 and helium-4. Magnetism in solid helium-3 will be investigated using the Heisenberg field approximation to calculate the magnetic and thermal properties. The current data base for solid helium-3 is not self-consistent at present and the source of this discrepancy will be sought. In another area, diffusion of the two-dimensional lattice gas for both helium-3 and helium-4 will be studied for comparison with experimental studies of monolayers adsorbed on grafoil. Problems of registry, vacancy tunneling, and phase transitions in monolayer systems will be investigated. A new area of research in the study of solitons and non-linear effects in quantum systems will be undertaken.

8.0022, THE ELECTRON G-FACTOR ANOMALY AND RELATED EXPERIMENTS

A. Rich, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Physics, *Ann Arbor, Michigan* 48104 (PHY77-26037)

This experiment uses the techniques of precise atomic metrology to measure a key fundamental property of an elementary particle (the electron) and its anti-particle (the positron). This is the measurement of the g-factor anomaly to an accuracy of 25 parts per billion. This will be a significant test of quantum electrodynamics and other fundamental physical theories. The method used is an extension of the Mott double-scattering technique. The anomaly is determined directly by observing the precision of the electron spin with respect to its velocity between

the two scatterings. A number of improvements have been incorporated in the experiment.

8.0023, NONCRYSTALLINE MAGNETIC MATERIALS

A.M. De Graaf, Wayne State University, School of Liberal Arts, Dept. of Physics, *4841 Cass Ave., Detroit, Michigan* 48202 (DMR78-08657)

Research previously supported under DMR76-17036.

Theoretical research in condensed matter physics will be carried out in order to study the properties of noncrystalline magnetic materials in general and those of cobalt and manganese aluminosilicate glasses in particular. In addition, several experiments on these glasses will be coordinated in cooperation with research groups at Wayne State University, the University of Sao Paulo and the University of Campinas. Various models of amorphous magnetism will be studied theoretically and compared with experimental results. This research will contribute to a deeper understanding of non-magnetic glasses, spin glasses, and other amorphous magnetic materials.

8.0024, THEORY OF SOLIDS AND LIQUIDS

J.W. Halley, University of Minnesota, Minneapolis Campus, School of Liberal Arts, Dept. of Physics & Astronomy, *322 Johnston Hall, Minneapolis, Minn sota* 55455 (DMR76-05186 A01)

Research previously supported by DMR76-05186.

Theoretical research in condensed matter physics will be carried out on a number of different topics, in order to enhance our understanding of the behavior of complex materials. These topics will include: (1) Magnetic systems, especially those which behave like one-and two-dimensional Heisenberg systems. Also, the dynamics of itinerant ferromagnets will be investigated. (2) Classical liquids, including the calculation of dynamical structure factors and depolarized light scattering. (3) Conductivity in disordered solids, particularly the use of percolation models and an analysis of metallic conductivity in the strong scattering limit.

8.0025, THERMALLY STIMULATED CURRENTS IN ALKALI-CONTAINING GLASSES

D.E. Day, University of Missouri, Rolla Campus, Center for Materials Research, *103 Parker Hall, Rolla, Missouri* 65401 (DMR77-13002)

This research will be an investigation of the storage and motion of electrical charge (polarization and conductivity) in alkali silicate glasses using thermally stimulated current (TSC) and ionic thermal current (ITC) techniques in order to obtain information about the nature of the alkali sites in vitreous solids. The study will investigate the localized sodium (Na) motion recently observed in a sodium silicate glass with these techniques, and which is currently attributed to the trapping of Na ions at the interface of immiscible phases, interfacial polarization, and to Na ion motion around the non-bridging oxygen ions, Na ion-(NBO)anion dipole polarization. The dependence of the parameters for this localized motion upon both glass composition and microstructure will be determined in order to evaluate those characteristics of the local alkali ion environment and glass microstructure which control short-range, and consequently, long-range alkali motion.

8.0026, MAGNETIC RESONANCE AND OTHER STUDIES AT LOW TEMPERATURES

R.E. Norberg, Washington University, School of Arts & Sciences, Dept. of Physics, *4559 Scott Ave., St. Louis, Missouri* 63130 (DMR78-10780)

This is a continuation of work sponsored under DMR-7618863. The diffusion and relaxation of dilute impurities of hydrogen and helium in simple solids and liquids will be measured. The Kapitza problem of energy transfer across a solid-liquid helium-II interface will be studied by means of measurements of phonon transmission and reflection. Metal hydrides will be studied by a method of hydrogen nuclear acoustic resonance. Defect controlled spin relaxation and ultra slow diffusion in solid krypton and krypton rare gas mixtures will be studied. Collective excitations in amorphous solids will be studied by magnetic specific heat at temperatures down to 100 mK. This work is important for understanding the nature of helium-II excitations at low temperature and the nature of diffusion in simple solids and liquids.

This is the first year of a two-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0027, THE STUDY OF VIBRATIONALLY EXCITED MOLECULES BY LOW-ENERGY ELECTRON SCATTERING

P.D. Burrow, University of Nebraska, Lincoln Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Lincoln, Nebraska* 68508 (ENG77-14649)

The research deals with the detection and study of vibrationally excited molecules by means of low-energy electron scattering techniques. Two methods for the determination of vibrational populations will be used and applied to excited nitrogen. Other electron impact processes with excited molecules will be investigated. Cross sections for collision processes such as ionization and dissociative attachment will be studied as a function of vibration content, for example, a study of the ionization of vibrationally excited nitrogen. New diagnostic techniques to examine the vibrational distribution of molecules will be developed. The production and deactivation of vibrationally excited molecules by collision with hot metal walls will be investigated. It appears that the numbers of collisions with a hot wall which are required before the vibrational temperature of a gas in contact with the wall reaches equilibrium with the wall temperature have not yet been determined quantitatively. Research will be initiated by using diagnostic techniques in conjunction with an oven source for vibrationally excited molecules. The oven will possess a simple tubular geometry with a variable length such that the number of wall collisions can be estimated with accuracy. The optical temperature of the oven and the vibrational distribution of the effusing molecules will be monitored. The research is a continuation of that done under NSF Grant No. ENG-7102472 AO1.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

8.0028, THEORETICAL STUDIES OF ATOMIC COLLISIONS

A. Halpern, City University of New York, Brooklyn College, School of Science, Dept. of Physics, *Bedford Ave. & Ave. H, Brooklyn, New York* 11210 (PHY78-11611)

Research in theoretical atomic physics will be initiated. Topics of interest include investigations of elastic scattering of charged particles by atoms, excitation of atoms and ions by electrons, protons, alpha particles, and other fully stripped atoms, atom-atom and ion-atom collisions, ionizing collisions, Glauber theory, and charge transfer collisions. The calculations are of both formal and practical interest in atomic physics. They will also be relevant to aspects of astrophysics and atmospheric physics, and to the plasma physics aspects of energy production and of nuclear pumped lasers.

8.0030, ELECTRON SPECTROMETRY OF SOLID SYSTEMS

J. Silcox, Cornell University, Ithaca Campus, School of Engineering, Dept. of Engineering & Applied Physics, *242 Carpenter Hall, Ithaca, New York* 14853 (DMR78-09204)

This is an extension of the research previously supported by DMR-7600834.

Experimental studies of the excitation spectra of solid state systems will be carried out using an electron microscope electron spectrometer system to measure inelastic electron scattering. A variable temperature stage will be used to monitor changes in phonon-electronic scattering terms in the multiple scattering. Single crystals of aluminum will be studied first with later extensions to metals with different screening radii. We expect data relevant to dynamical scattering effects to become available and propose detailed comparisons with existing calculations. Use of the variable temperature stage in studies dichalcogenide materials is proposed with particular concern for compounds of the form Nb1-xVxSe2, a search for two-dimensional electron gas behavior and dynamical scattering effects. One-dimensional materials will be explored when they become available at Cornell.

This is the first year of a three-year continuing grant.

8.0031, PHOTOPION REACTIONS IN COMPLEX NUCLEI

J.E. Winhold, Rensselaer Polytechnic Inst., School of Science, Dept. of Physics, *110 8th, Troy, New York* 12181 (PHY77-09408 A01)

A program of photopion production studies at the Bates Linear Accelerator (MIT) will be continued in collaboration with Boston University and MIT. The program will emphasize observation of charged pions and measurement of differential cross sections for specific final nuclear states. Initially a low-energy pion spectrometer completed in 1976 will be used to cover a pion energy range from 10 to 45 MeV with 1 MeV energy resolution, extending recently published measurements on carbon-12 to a variety of other nuclei. Lithium-6, carbon-12, carbon-13 and oxygen-16 will be used as targets for studies of the production cross sections for positive and negative pions; searches will be made for production of giant multipole resonances, especially electric and magnetic dipole resonances; measurements will be made of pion production on very light nuclei, especially deuterium and helium-3. Towards the end of the three-year program it is hoped to initiate measurements with a new and larger spectrometer now being planned at MIT which will permit studies at higher energies.

Analysis of the data is expected to provide new insight into the interaction between pions and nuclei, and to provide new types of information concerning nuclear structure and transitions.

This work is a continuation of that performed under Foundation grant PHY76-14909.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0033, MAGNETIC RESONANCE PROPERTIES OF IONS IN NOBLE GAS LIQUIDS AND SOLIDS

J.F. Reichert, State University of New York, Buffalo Campus, School of Natural Sciences & Mathematics, Dept. of Physics, *3435 Main St., Buffalo, New York* 14214 (DMR78-23973)

This research is a continuation and extension of work sponsored under grant DMR7610135. Negative ions in liquid helium-3 constitute a unique, model system for studying, in depth, fundamental aspects of electron-nuclear, spin-spin interactions. Professor Reichert's recent experimental achievements in applying magnetic resonance techniques have resulted in the first experimental data suggesting the existence of a strong hyperfine coupling spin-lattice relaxation process in liquid helium-3. Techniques are now available to use this 'microscopic probe' of liquid helium-3 to study dynamic nuclear-polarization effects. Electron spin resonance and electron-nuclear double resonance techniques will be used to elucidate details pertaining to the fundamental nature of the hyperfine interaction. This is the first year of a three-year continuing grant.

8.0034, THEORETICAL STUDY OF SOLID ELECTROLYTES (SUPER-IONIC CONDUCTORS)

S. Choi, University of North Carolina, Chapel Hill Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *Chapel Hill, North Carolina* 27514 (DMR7822207)

Solid electrolytes are interesting because one species of ions in the crystal tends to be disordered and liquid-like while other species remain in a crystalline framework. They have an abnormally high ionic electrical conductivity and other interesting properties such as varied phase transitions. For engineering applications, solid electrolytes are important because they may be used as an electrolyte in a battery, a fuel cell, or a heat-to-electricity converter. Although our understanding of most promising solid electrolytes such as beta-alumina and RbAg4I5 has made considerable progress, there are many phenomena and properties not well understood. Theoretical studies and numerical computations will be done on the equilibrium and transport properties of mixed (solid solution) beta-alumina, properties of charge compensating defects and impurities in beta-alumina, and the silver ion conduction in RbAg4K5. Classical many-body theories will be modified or improved, an also some numerical computation (such as the Monte Carlo method) will be done to enhance our understanding of the above mentioned properties and phenomena.

8.0035, ELECTRON AND PHONON INTERACTIONS IN METALS

J.J. Trivisonno, John Carroll University, Graduate School, Dept. of Physics, *20700 N. Park Blvd., University Heights, Cleveland, Ohio* 44118 (DMR76-00784 A01)

This is a continuation of research previously supported by NSF grant DMR-7600784.

Ultrasonic attenuation experiments will be done in ultra pure magnesium single crystals to determine the electronic contribution to the ultrasonic attenuation of longitudinal and shear waves. Doppler-shifted cyclotron resonance experiments will also be done in order to obtain information about electron life times and electron-phonon interactions. Realistic calculations of the magnetic field dependence of the attenuation in magnesium, cadmium, and zinc will be made using the Fermi surfaces of these metals based on band structure calculations. A transducerless electromagnetic generation and detection technique will be employed to study the Martensitic phase transformation in lithium six, lithium seven and sodium. This technique will also be used to study attenuation absorption edges in potassium. Phonon propagation characteristic studies in degenerate semiconductors will be continued in an attempt to obtain information about electron-phonon interactions and phonon mean free paths in these materials.

Directorate for Mathematical & Physical Sciences, Div. of Materials Research

8.0036, ELECTRON PARAMAGNETIC RESONANCE CHARACTERIZATION AND MONITORING OF SILICON DETECTOR MATERIALS

G.K. Miner, University of Dayton, School of Arts & Sciences, Dept. of Physics, *300 College Park Ave., Dayton, Ohio* 45469 (DF055040; AFOSR-79-0108)

AF function - microwave solid state electronic devices are essential components of Air Force surveillance, electronic countermeasures and communication systems. The development of silicon based infrared detector material is dependent upon the knowledge and control of dopants and impurities. Opportunity - this research should improve the ability to develop detectors for the 3-5 micron range and large detector arrays. Objective - the objective of this research is to characterize and monitor impurities and dopants in silicon detector materials. How work contributes - this work will provide feedback to establish crystal growth conditions to improve silicon detector materials.

X-level samples and neutron transmutation doped samples will be examined with x-band spectrometer. Dangling bond observations will be attempted. K-band and dispersion modes will be employed for general study of defects.

8.0037, MAGNETIC RESONANCE STUDIES OF DEFECT BEHAVIOR IN PEROVSKITE AND RUTILE STRUCTURED MATERIALS

L.E. Halliburton, Oklahoma State University, School of Arts & Sciences, Dept. of Physics, *Agricultural Hall, Stillwater, Oklahoma* 74075 (DMR77-08465 A01)

This research was previously supported under DMR 73-07656.

The principal goal of this research program is to determine the formation mechanisms and resulting electronic structure of defects in perovskite and rutile structured halides. Specifically, the self-trapped exciton triplet states in KMgF3 and MgF2 will be investigated by combining optical and magnetic resonance techniques. The results of these experiments will provide a better understanding of the photochemical damage process in low-symmetry materials. The second area of investigation will be the magneto optic properties of luminescing Mn2 ion-F center exchange coupled close pairs in KMgF3. Finally, electron-nuclear double resonance (ENDOR) studies of the self-trapped hole and the impurity-associated fluorine interstitial centers in KMgF3 will be continued, as well as extension of this work to an electron spin resonance (ESR) investigation of interstitial centers in RbCaF3.

SUPPORTED BY U.S. National Science Foundation,

8.0038, STUDY OF ELECTRON IMPACT OF LASER MEDIA WITH EMPHASIS ON THE ROLE OF TEMPORARY NEGATIVE ION FORMATION

D.E. Golden, University of Oklahoma, Norman Campus, School of Arts & Sciences, Dept. of Physics & Astronomy, *660 Parrington Oval, Room 101, Norman, Oklahoma* 73069 (ENG76-82943 A01)

This experimental program is aimed at the measurement of the basic parameters necessary for the design of laser pumped by electron impact. The researchers will measure electron impact excitation cross sections, optical branching ratios of the subsequent decays, excited state lifetimes, polarization of the radiation, and collisional deactivation decay and energy transfer rates in the case of metastable excitation for a number of target atoms and molecules. The measurements will be performed at sufficient electron energy resolution so that particular attention can be directed towards the role of resonances in the excitation process. The experimental design is such that high energy resolution measurements can be performed with sensitivities much larger (by more than a factor of 5000 in some cases) than previously thought possible. This is a continuation of research previously supported under NSF grant ENG-7523512.

8.0039, ELECTRONIC STRUCTURE AND SPIN-RESOLVED K-SPACE SPECTROSCOPY IN METALS

D.H. Lowndes, Oregon State Higher Education System, University of Oregon, School of Liberal Arts, Dept. of Physics, *1472 Kincaid St., Eugene, Oregon* 97401 (DMR78-06271)

This research was previously supported under DMR-7407652.

Improved resolution of the de Haas-van Alphen technique will be used in studies of electronic structure in a variety of metals. These studies include an investigation of the onset of ferromagnetism in a metal with dilute magnetic impurities; an investigation of the connection between the electronic structure and the A-15 structural phase transition in superconducting Nb3Sn and V3Si; and an investigation of the electronic structure in the La(Gd,Ce)Al2 system in which superconductivity may coexist with a magnetic state. Experiments will also be carried out in single crystals of mercury to investigate the quenching of the electron-phonon mass enhancement by an intense magnetic field. Large magnetic field-dependent increases in electron-impurity scattering will be studied by examination of the line shape from single quantum oscillations. Experiments will be continued to investigate the combined effects of Fermi surface geometry and the spin-orbit interaction in order to understand the origin of large shifts in the electronic g-factor.

This is the first year of a three-year continuing grant.

8.0040, THERMODYNAMICS AND STATISTICAL MECHANICS OF PHASE TRANSITIONS

R.B. Griffiths, Carnegie Mellon University, Mellon Inst. of Science, Dept. of Physics, *4400 5th Ave., Pittsburgh, Pennsylvania* 15213 (DMR78-20394)

Research previously supported by DMR7623071. The following topics in the general area of phase transitions and critical phenomena will be investigated: 1. A thermodynamic model of a tricritical point in a particular mixture will be constructed in order to assist some research groups which are studying light scattering in this mixture and to test for the presence of expected logarithmic corrections to the thermodynamic properties. 2. The possible utility of the mathematical discipline of Catastro-

phe Theory for classifying multicritical points will be investigated, with special reference to multicritical points in liquid mixtures. 3. Theoretical models will be constructed in an effort to understand the phase transitions which occur when noble gases are adsorbed on a graphite substrate. Of particular interest are the first-order transitions observed as single layers are added to the substrate, and the various transitions which occur below or near a coverage of one layer. 4. Previous research has indicated that real-space renormalization-group methods, which are widely used for certain problems in statistical mechanics, suffer from certain mathematical difficulties. The study of these difficulties will continue. 5. Mathematical models will be constructed for various non-linear processes which occur during first-order phase transitions, such as dendritic growth of crystals.

This is the first year of a three-year continuing grant.

8.0042, MAGNETIC EFFECTS IN POLYATOMIC GASES AND AMORPHOUS METALS

T.W. Adair, Texas A & M University, College Station Campus, School of Science, Dept. of Physics, *College Station, Texas* 77843 (A-288)

The thermomagnetic torque (TMT) has been measured in nitrogen-helium gas mixtures at room temperature. The TMT in nirogen gas is the result of non-spherical non-spherical particle interaction. By adding helium to the nitrogen gas an additional contribution is observed due to the non-spherical spherical particle interaction. This interaction has been studied by varying the helium concentration in the mixture and measuring the change in the characteristic maximum magnetic field-pressure ratio, (H/p)max and the maximum torque times pressure divided by the temperature difference, (P/delta T)max. As the helium concentration has increased the value (H/p)max was found to decrease linearly. The maximum value of (P/delta T) max was observed at concentration of 50% helium. Hall coefficient measurements for the amorphous transition metal alloy La8Ga2 have been obtained at LHe, LN2 and room temperatures. Rh varies from plus 8.9 at room temperature to plus 11 at 4.2K in units of 10 to the minus 11th power cu. m/As. The values of Rh are consistent with the literature value for the pure liquid metal in contrast to the literature value of minus 8.9 for crystalline dhcp La.

8.0043, ATOMIC AND MOLECULAR PROCESSES

J.C. Browne, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Computer Sciences, *200 W. 21st St., Austin, Texas* 78712 (F-379)

Charge transfer reactions of the type, A plus q plus B yields A(plus q minus 1) plus B may leave the A(plus q minus 1) ion in a highly excited electronic state. This excited state may in some cases radiate to a lower state with the emission of VUV or X-ray photons. If the cross section for charge transfer is large, a population inversion and a potential X-ray laser may result.

The system He ions plus Li yields He ion plus Li ion colliding at low energy has been found by ab initio computations to preferentially produce He ion (3l) which may decay either by the emisson of 256A photons or by a cascade of 1640A and 304A photons. At low relative collision velocities, v approximately 0.5 x 10 to the 8th power sq. cm/sec, cross-sections of sigma approximately 10 to the minus 15th power sq. cm for the production of He ion (3l) are found. At larger velocities, v greater than 2 x 10 to the 8th power cm/sec, the ionization reaction A plus q plus B yields A(plus q minus 1) plus B ions plus e predominates thus destroying the possibility of population inversion on an excited electronic state. A principal significance of this work is its narrowing of a large and very difficult experimental domain. Experimental validation of this potential population inversion is needed.

SUPPORTED BY Robert A. Welch Foundation

8.0044, THEORETICAL-NUMERICAL STUDIES OF PHYSISORPTION AND OTHER PROPERTIES OF CRYSTALLINE SURFACES

F.W. de Wette, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Physics, *200 W. 21st St., Austin, Texas* 78712 (F-433)

In our continuing studies of dynamical and related properties of ionic crystal surfaces we have completed the calculation of the infrared absorption properties of microcrystals of MgO. We found close agreement between the main infrared absorption frequency omega m of these near-cubical clusters of the Frohlich frequency omega P of the continuum theory of infrared absorption in small spheres; the size dependence of the calculated absorption spectrum appears to agree quite well with experimentally observed absorption spectra.

A collaborative effort has been initiated with scientists of the Max-Planck Institut fur Festkorperforschung, Stuttgart, West Germany, to study and develop shell models describing ionic interactions near the surfaces of ionic crystals. The aim is to arrive at models that will: (1) describe the bulk properties properly, and (2) allow the simultaneous calculation of surface structural and surface dynamical properties. Such models are of particular importance for the description of surface properties of crystals containing O ions (such as MgO). The free O ions seem to be unstable, and in crystalline environments its polarizability is proportional to the ionic volume. Hence variable anion polarizability (and possible charge transfer near the surface) has to be taken into account in the modified shell models.

8.0045, ULTRASOUND STUDIES OF CONCENTRATION OR CRITICAL FLUCTUATIONS IN LIQUID BINARY SYSTEMS WHICH EXHIBIT A METAL-NONMETAL TRANSITION

D.E. Bowen, University of Texas, El Paso Campus, School of Liberal Arts, Dept. of Physics, *El Paso, Texas* 79902 (DMR78-08494)

The broad goal of this work is to understand what factors govern the transition of a substance from a conducting state at higher temperatures to a non-conducting state at a lower temperature. This transition is called a metal-nonmetal (MNM) transition and is of broad interest in condensed matter science. The attenuation and velocity of ultrasound through solutions of alkali metals in liquid ammonia are measured as functions of temperature near the critical point. The data are analyzed using Fixman-Kawasaki theory to infer correlation lengths and, perhaps, scaling parameters.

This is a continuation of work supported under DMR 75-23652.

8.0046, LOCALIZED AND COLLECTIVE EXCITATION AND ORDERING PROCESSES IN IONIC CRYSTALS

F. Luty, Utah Higher Education System, University of Utah, School of Letters & Science, Dept. of Physics, *1400 E. 2nd S., Salt Lake City, Utah* 84112 (DMR77-12675 A01)

Research previously supported by DMR74-13870.

The investigations will cover a variety of systems with the purpose of establishing interconnections between localized defect and collective crystal behavior. (1) Molecular and off-center paraelectric defects will be investigated. Particular emphasis will be on studies of these systems under hydrostatic pressure. The close similarities of the pressure-induced transitions to the behavior of displacive ferroelectrics will be explored. (2) Mixed alkali-halide-cyanide crystals of the type KBr1-x(CN)x will be studied by means of Raman, optical and dielectric techniques. (3) Resonance Raman scattering and hot luminescence effects of F-center defects will be carried out. The systems to be studied will include hydrogen defects in alkali-halides. The motivation of this work, besides the fundamental interest in the interrelation of the resonance scattering process, will be the potential of these systems for broadly tunable IR laser application.

8.0047, ELECTRONIC PROPERTIES OF METALS AND ALLOYS IN HIGH MAGNETIC FIELDS

R.V. Coleman, University of Virginia, School of Arts & Sciences, Dept. of Physics, *Garrett Hall, Charlottesville, Virginia* 22903 (DMR78-02553)

The electronic structure and properties of layer crystals exhibiting charge density wave (CDW) transitions will be investigated experimentally. Measurements of quantum oscillatory phenomena at high magnetic fields will be made on single crystals of layer structure dichalcogenides and trichalcogenides. DC transport measurements including Hall effect, magnetoresistance and superconducting anisotropy will also be carried out. Both Shubnikov de Haas and de Haas van Alphen oscillations will be measured using AC modulation and harmonic detection. These techniques are being extended for use on the high field Bitter solenoids at the National Magnet Laboratory. Charge density wave formation in the chalcogenides will be studied and the effects of organic intercalation and pressure on the CDW will be followed by measuring the quantum oscillatory phenomena. DC susceptibility, Hall effect and magnetoresistance as a function of temperature will also be used to correlate results with CDW formation.

This is the first year of a three-year continuing grant.

8.0048, DISLOCATION DYNAMICS

J.W. Mitchell, University of Virginia, School of Arts & Sciences, Dept. of Physics, *Garrett Hall, Charlottesville, Virginia* 22903 (DMR77-26168)

This is a continuation of a fundamental investigation on the motion of high velocity dislocations in solids. The objective is to understand the origins of resistance to the motion of individual dislocations from a theoretical and experimental point of view. Studies on Cu-Ni-Pd-Al alloys which have relatively high yield points due to solute segregation at residual dislocations, and yet have an apparent low fractional resistance to dislocation motion will be continued. The dislocation velocities as a function of temperature (4.2 degrees to 300 degrees K) and applied stress will be determined for single crystals of these alloys, as well as for single crystals of Cu-Ni and Cu-Al-Ni alloys surface hardened by diffusion of Pd into the surface layers. Supplementary studies required to establish the detailed dislocation mechanisms of the relaxation processes will be done. Current research on the lattice dynamical theory of dislocation motion will be continued with particular emphasis on the velocity range half the speed of sound, where low stress long-range motion of straight dislocations has been shown to occur in simple lattice models. In addition, a detailed study of the interaction of moving dislocations with phonons, with the aim of establishing a theory of the temperature dependence of dislocation mobility will be undertaken, and will include the effect of dispersed impurities in a non-dilute alloy. Lastly, theoretical studies on the propagation of dislocation avalanches and microcracks will be undertaken. This is a continuation of research, previously funded under NSF Grant DMR76-01059. This is the first year of a two-year continuing grant.

8.0049, X-RAY ABSORPTION SPECTROSCOPIC INVESTIGATION OF THE STRUCTURE OF NON-CRYSTALLINE SURFACE LAYERS

F.W. Lytle, Boeing Engineering & Construction Co., *Seattle, Washington* 98124 (DMR77-12919 A01)

This research will be a study of the structure of surface oxide layers on metals such as titanium, aluminum and tantalum using Extended X-ray Absorption Fine Structure (EXAFS) experiments at the Standard Synchrotron Radiation Project. Determination of the structure and energy position of the absorption edges will yield information about the orbitals of chemical bonding and ionicity of the bonds. The EXAFS spectra will be analyzed to determine the number, distance and type of coordinating atoms surrounding the adsorbing atom.

The aim is to understand the interatomic relationships between the metal and oxide, hydroxide or other anions from the anodizing solution. Such information has not been possible in the past and may reflect on common usage of these materials varying from structural applications, protective finishes, and dielectric strength to fuel cells, electrode processes and exo-electron emission.

This is a continuation of research initiated under NSF Grant DMR74-24261 AO1.

8.0050, SKIN ALIGNED ATOMIC HYDROGEN

O.E. Vilches, University of Washington, School of Arts & Sciences, Dept. of Physics, *Seattle, Washington* 98105 (DMR77-27528)

An experimental study will be made of the production, storage, and thermodynamic properties of spin polarized atomic hydrogen and its isotopes in their three dimensional bulk forms and as absorbed films. The prediction that at all temperatures spin polarized atomic hydrogen is gas which shows strong quantum effects will be tested. Further, the prediction that for spin polarized deuterium the liquid and vapor phases coexist to the lowest available temperature will be tested.

This is the first year of a two-year continuing grant.

10.0001, STABLE FREQUENCY SOURCE UTILIZING A SUPERCONDUCTING-CAVITY-STABILIZED OSCILLATOR

M.H. Cohen, California Inst. of Technology, Graduate School, Dept. of Astronomy, *1201 E. California Blvd., Pasadena, California* 91109 (AST76-23634)

Very long base line interferometry (VLBI) is the technique in which two radiotelescopes thousands of miles apart can be used together to resolve the finest details of distant radio sources. This is done by recording the signals from the separate telescopes along with timing information from a highly accurate clock and later playing back both tapes into a special processor. The success of the method depends upon the accuracy of the clocks at each telescope. Until now most telescopes have used hydrogen maser time standards which are quite expensive. A

new type of standard based on a superconducting cavity stabilized oscillator will be developed for use at the Owens Valley Radio Observatory of the California Institute of Technology which does not have a hydrogen maser. The new standard will greatly improve the stability and sensitivity of VLBI observations made at the observatory and will be available to all qualified users.

10.0002, OBSERVATIONAL STUDIES IN GALACTIC AND EXTRAGALACTIC ASTROPHYSICS

B.T. Soifer, University of California, San Diego Campus, Graduate School, Dept. of Physics, *P.O. Box 109, La Jolla, California* 92037 (AST7682890A02)

Infrared spectrophotometric observations of galactic and extragalactic sources will be carried out. The UCSD-U. Minn. Mt. Lemmon Observatory and the 3-m telescope of Lick Observatory will be used. Necessary improvements will be made in the multi-detector, grating spectrometer in order to increase the ultimate sensitivity of infrared spectroscopy.

The infrared observations will consist of moderate resolution lambda/delta 70) spectrophotometry from 2 to 4 and 8 to 13 microns. Galactic sources to be studied are those that might exhibit the unidentified spectral features discovered in NGC 7027, newly discovered sources, and chemically peculiar stars. Extragalactic sources to be studied include some of the brightest quasistellar objects in which optical emission lines are redshifted into the 2 micron window. A few of the brightest infrared galaxies will also be observed.

In developing the grating spectrometer, the aim is to build the most efficient instrument possible and to test and demonstrate its performance. The use of an up-looking configuration, Fabry field optics, and the best demonstrated photoconductors were dictated by this aim. They shall test the spectrometer on the Mt. Lemmon telescope, make any necessary improvements, test and improve the data acquisition and reduction techniques, and use the system for useful astronomical observations.

This is a continuation of AST-7682890.

10.0003, A SPECTROSCOPIC STUDY OF O-TYPE STARS

P.S. Conti, University of Colorado, Boulder Campus, School of Arts & Sciences, Dept. of Astro Geophysics/Physics & Astrophysics, *1200 University Ave., Boulder, Colorado* 80302 (AST78-20135)

Support is for a program of spectroscopic research on the O-type stars, the hottest, brightest, and most massive of all stars. These stars must be very young on a cosmic time scale since they pour out energy at so large a rate (100,000 to one million times the luminosity of the sun). They ionize the immediate stellar neighborhood; and their presence is important for the formation and early evolution of other nearby stars. All O-type stars lose mass, for the hottest ones, at such a rate that the outer atmosphere of the star is substantially modified. This 'stellar wind' also influences the immediate surrounding and affects the subsequent evolution of the O-type star itself.

Spectroscopic observations of O-type stars will be obtained in two areas. The first is to study phenomena in the stellar winds as evidenced by the emission and absorption line profiles, as points of contact with the theory of expanding and extending atmospheres. This will permit specific statements about the mass-loss mechanism and the physical phenomena observed in the stellar winds. The second aspect will be to determine stellar masses by investigations of O-type binary stars. It is suggested that O stars with masses up to 100 times that of the sun may exist, but only binary stars can give directly derived numbers. The determination of the fundamental parameter of stellar mass has overriding importance in the understanding of the evolution of these very luminous stars.

Prior support was by NSF grant AST76-20842 A01.

10.0004, SOLAR WIND STUDIES USING THE COCOA CROSS RADIOTELESCOPE

W.M. Cronyn, University of Iowa, School of Liberal Arts, Dept. of Physics & Astronomy, *Jessup Hall, Iowa City, Iowa* 52240 (ATM77-27530)

The solar terrestrial research program to study dynamic solar wind features associated with, and delineated by interplanetary scintillation (IPS) activity of natural radio sources, using the University of Iowa Cocoa Cross radiotelescope is to be continued. Its operating frequency and large electronically steerable collecting area make it possible to take daily synoptic measurements of scintillation index and spectra on far more sources over a larger range of ecliptic coordination than would be possible with any other telescope in the world.

Utilizing a numerical modeling code and recently installed digital data acquisition systems, it should be possible to deduce estimates of distance, velocity and electron density power spectrum (including power law index). Correlation with in situ spacecraft measures will continue with detailed analysis of events to deduce the shape and extent of the irregularity structures in and out of the ecliptic plane. The occurrence and physical characteristics of the plasma turbulence which gives rise to IPS will be studied on time scales of 27 days, 1 day and less than 1 minute to study streams, transient fast-moving plasmoids and shock fronts and associations with solar phenomena.

10.0005, A LABORATORY EXPERIMENT OF AN IONOSPHERIC INTEREST - MICROWAVE SCATTERING BY A SYSTEM OF PLASMA WAVES OR IRREGULARITIES

N. D'Angelo, University of Iowa, School of Liberal Arts, Dept. of Physics & Astronomy, *Jessup Hall, Iowa City, Iowa* 52240 (ATM78-00529)

A process of cosmic noise absorption (CNA), involving backscatter of 20-30 MHz electromagnetic radiation of cosmic origin by E region plasma waves, has been recently suggested. The relevant E region plasma waves are produced by the Farley-Buneman instability, which is excited by large ionospheric electric fields.

This grant funds studies in the laboratory, in a multidipole plasma device, of the scattering of electromagnetic radiation (3 cm mu waves) by systems of Farley-Buneman waves. Scattering cross-sections will be measured for a given level of Farley-Buneman turbulence. This will then be compared to theory to test its validity and/or seek improvements therein.

10.0006, INVESTIGATION OF A GROUP OF DENSE ROTATING INTERSTELLAR CLOUDS WHICH ARE UNDERGOING EXTENSIVE FRAGMENTATION

F.O. Clark, University of Kentucky, College of Arts & Sciences, Dept. of Physics & Astronomy, *Limestone & Euclid, Lexington, Kentucky* 40506 (AST76-80200 A01)

In the Taurus region of the sky there is a group of interstellar gas clouds which are rotating, extensively fragmented, and probably in a state of gravitational collapse. These clouds will be studied by means of the microwave spectral lines of the common interstellar molecules formaldehyde, hydroxyl radical, and carbon monoxide. The study will determine the physical parameters of these clouds, such as kinetic temperature, density and density gradient, kinematics (rotation, fragmentation, and other measurable motions), and possibly also chemistry. The study will establish the details of rotation and fragmentation for

this group of interstellar clouds, and demonstrate how the collapse motions are consistent with the conservation of angular momentum. The results will be useful for understanding how these processes actually take place and will provide an observational basis for theoretical calculations of realistic models which include rotation. The study is based on preliminary results which show unexpected detailed fragmentation taking place.

This is a continuation of work done under grant AST 76-80200.

10.0007, RADIO CORONAL HOLES AND GEOMAGNETIC DISTURBANCES

M.D. Papagiannis, Boston University, Graduate School, Dept. of Astronomy, *705 Commonwealth Ave., Boston, Massachusetts* 02215 (DF249650; F19628-77-C-0189)

AF function - communications and navigation. Deficiency - radio signal fading and changes in satellite orbit ephemerides. Objective -to determine the relationship between solar coronal hole radio parameters and the magnitude of terrestrial magnetic disturbances initiated by the high speed wind streams from the holes. How research contributes -defines those radio coronal hole parameters that are operationally significant in forecasting the occurrence and severity of geomagnetic disturbances.

Archival radioheliograms obtained with moderate resolution radiotelescopes in the United States and Brazil at wavelengths from 21 cm to 0.12 cm will be examined and scaled for coronal hole data. Spectral characteristics of the radio coronal hole will be compared with solar wind and geomagnetic data to establish operational forecast parameters.

10.0008, RADIO ASTRONOMY AT THE HAYSTACK OBSERVATORY

P.B. Sebring, Northeast Radio Observ. Corp., *Cambridge, Massachusetts* 01886 (AST75-14701 A03)

The Haystack Observatory will provide a radio astronomy observing facility available to all U.S. astronomers and easily accessible to radio astronomy groups based in New England. A great deal of research in the coming year will center around programs aimed at understanding the characteristics of molecules found in interstellar space and their relationship to clouds of dust and hydrogen gas out of which stars are being formed. Molecules to be considered include water, methanol and ammonia.

A considerable amount of effort will be devoted to Very Long Baseline Interferometry. This work involves worldwide cooperative projects and now provides the highest resolution and most accurate positional measurements in astronomy. One-fourth of the radio observing time will be used for this type of work.

This is a continuation of support under NSF Grant AST 75-14701.

10.0009, ASTROPHYSICAL FLUID DYNAMIC STUDIES

R.F. Stein, Michigan State University, School of Natural Sciences, Dept. of Astronomy & Astrophysics, *243 Natural Resources Bldg., East Lansing, Michigan* 48824 (AST76-22479 A01)

Techniques for solving coupled radiative transfer-nonlinear fluid flow problems in one dimension and nonlinear fluid flow problems in two and three dimensions will be developed and used to study interrelated solar problems: 1) The generation of acoustic and magnetic waves by nonlinear interaction with turbulent motions and by overstability due to interaction with the radiative flux. 2) The deposition of energy and momentum in the chromosphere and corona. The goal is to develop tools for analyzing observed solar waves and models of the energy balance in the chromosphere and corona with heating by magnetic, acoustic, and gravity waves. Once a self-consistent solar model is constructed, the same techniques will be applied to other stars where chromospheres and coronas are observed.

Also, accretion onto protostars and the formation of compact H II regions in the dense circumstellar cloud will be studied through the calculation of theoretical models of the evolution of compact H II regions to use with infrared and radio observations to analyze conditions of star formation.

Prior support was by NSF grant AST 76-22479.

10.0010, TWO-DIMENSIONAL CLASSIFICATION OF STARS SOUTH OF PLUS 20 DEGREES IN THE HENRY DRAPER CATALOGUE

C.R. Cowley, University of Michigan, Ann Arbor Campus, School of Literature Science & the Arts, Dept. of Astronomy, *Ann Arbor, Michigan* 48104 (AST77-27744)

This project will continue two-dimensional spectral classification of the southern stars of the Henry Draper catalogue. The spectra are on high-quality objective-prism plates taken with the Michigan Curtis Schmidt telescope located at the Cerro Tololo Inter-American Observatory in Chile. Volume 1, containing 36,000 stars between declinations of 90 degrees and minus 53 degrees was published in 1975, and Volume 2, containing 31,000 stars between declinations between minus 53 degrees and minus 40 degrees is now being prepared for publication.

During the two-year period of this grant it is expected that Volume 3 (containing classifications of about 32,000 stars) will be started. Also, the remaining plates for regions accessible rom Cerro Tololo will be obtained. In addition some combined statistical analyses of Volume 1 and 2 will be made, and lists of stars of special interest will be published.

10.0011, SPECTROSCOPY OF FAINT SOURCES

A. Slettebak, Ohio State University, Columbus Campus, School of Mathematics & Physical Sciences, Dept. of Astronomy, *164 W. 17th Ave., Columbus, Ohio* 43210 (AST77-26890)

Observations with an image-dissector scanner attached to a Cassegrain spectrograph on the Perkins 72-inch telescope in Flagstaff, Arizona, will be made of objects identified by means of three independent deep-sky surveys: (1) the Steward Observatory Near-Infrared Photographic Sky Survey, (2) Dr. A. A. Hoag's lists of faint objects with peculiar emission, obtained through the use of transmission-grating slitless spectroscopy, and (3) the Ohio State University Radio Observatory lists of radio sources. Many different kinds of objects, both galactic and extragalactic, have been and are being detected by these surveys and will be studied spectroscopically with the image-dissector scanner. These observations are expected to help provide a better understanding of the galactic structure and the morphology of external systems.

This grant will provide funds for the acquisition of a minicomputer at the Ohio State University for data reduction and software development, and for travel to make the necessary observations.

10.0012, EXTRAGALACTIC AND SOLAR SYSTEM RADIO ASTRONOMY

J.N. Douglas, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (AST77-28477)

A program of extragalactic radio astronomy will be carried out in three main phases: 1. Continuation of the Texas Sky

Survey. Accurate (plus or minus 1") positions, flux density structure and variability data are being obtained at 380 and 335 MHz for all sources north of minus 35 degrees declination and brighter than 0.25 Jansky (about 50,000 sources). Basic observations will be 95 per cent complete and one-third of the data will have been reduced to publishable form by the spring of 1979. 2. Identification of radio sources from the survey with optical objects from the National Geographical Society - Palomar Sky Survey, using our accurate radio positions and accurate optical positions measured with our computer-interactive laser measuring engine. Experience to date shows about 45 per cent of radio sources to have optical counterparts within 5", having an identification reliability higher than 90 per cent. The entire survey is thus expected to produce about 22,000 optical identifications, an order-of-magnitude increase over what is now available in the literature. 3. Spectroscopic and photometric observations of selected large samples of the identifications are carried out at McDonald Observatory by Drs. Derek and Beverly Wills.

Supplementary programs in instrumentation and synoptic monitoring of Jupiter will also be carried out. This is a continuation of research done under AST 76-01883 A01.

10.0013, GALACTIC ABUNDANCES OF THE CHEMICAL ELEMENTS

P.A. Vanden Bout, University of Texas, Austin Campus, School of Natural Sciences, Dept. of Astronomy, *200 W. 21st St., Austin, Texas* 78712 (F-623)

Radio frequency studies of galactic molecular clouds have been made to investigate the effects of chemical reactions on the relative abundances of different isotopic species of interstellar molecules. Knowledge of the effects is necessary if correct relative abundances of nuclear isotopes are to be obtained from astronomical observations of molecular spectral lines. Work has concentrated on deuterated molecules. Interstellar deuterium isocyanide, DNC, was discovered by observing its J equals 2-1 rotational transition at 152.60977 GHz. Measurements of the (DNC/HNC) ratio in a variety of molecular clouds are correlated with cloud kinetic temperatuue and indicate that the deuteration of HNC proceeds via exchange reactions between HD and a molecular ion. Observations of HCO ion and DCO ion have been made and analyzed to put limits on the abundance of free electrons in galactic molecular clouds. Results are consistent with the abundances necessary for gas-phase ionmolecule chemistry to operate.

Optical wavelength sppctroscopy of interstellar atoms has been continued with the detection of lithium 6708 A toward an additional two stars, bringing the total number of interstellar clouds in which lithium abundances can be studied to six.

SUPPORTED BY Robert A. Welch Foundation

10.0014, DEVELOPMENT OF INFRARED ARRAY SPECTROMETER SYSTEMS

R.D. Gehrz, University of Wyoming, School of Arts & Sciences, Dept. of Physics, *P.O. Box 3435, University Station, Laramie, Wyoming* 82070 (AST76-05039 A02)

Observations at infrared wavelengths in combination with radio, millimeter and optical studies are rapidly adding to our knowledge of a variety of objects in the universe. An array of six infrared detectors has been used to improve the efficiency of observing the inherently weak infrared signals.

A program of further development of array detectors on spectrometer systems will be carried out. The number of detectors will be increased and the wavelength coverage will be expanded. The resulting instruments will be tested at Kitt Peak National Observatory and will be the main auxiliary instruments to be used on the University of Wyoming 90-inch infrared telescope.

This is a continuation of work currently supported under NSF grant AST 76-05039 A01.

10.0015, SPACECRAFT CHARGING STUDIES IN EUROPE

G.L. Wrenn, University of London, University College, Mullard Space Science Lab., *Dorking, England, United Kingdom* (DF289750; AFOSR-78-3713)

AF function - space system survivability by control or elimination of differential spacecraft charging effects. Deficiency - a comprehensive knowledge of European capabilities in spacecraft charging technology would enable the USAF to fully capitalize on advances in this field by European R&D organizations. Research - this effort will complement AFGL, AFOSR, AFML and SAMSO programs to understand the spacecraft charging phenomena and to control or eliminate its effects on USAF and DOD space systems. Research will investigate European advances in this field and assess applications possibilities for lengthening the lifetimes of space systems. How research contributes - research will enable AFGL to incorporate the latest European advances in spacecraft charging technology to the SCATHA satellite program and to obtain more accurate knowledge of the space environment in which space systems operate.

An internationally respected authority in space physics will conduct an assessment of European capabilities in the field for further examination and application by AFGL space environment experts.

(AD-A081726; TSC-FAA-79-29; FAA-MS-79-7) Avail: NTIS
HC A04/MF A01 CSCL 01/2

This report provides a summary and analysis of the data collected in the 1978 General Aviation Pilot and Aircraft Activity Survey. The survey was conducted at a random sample of airports across the nation and Puerto Rico, throughout the months of July and August 1978, by the Federal Aviation Administration with the assistance of the Civil Air Patrol. The survey data provide information regarding the magnitude and characteristics of general aviation including: type and source of aircraft, flight purpose, utilization of flight plan and weather information services, trip length in time and distance, pilot age and certification. Estimates are made of total 1978 general aviation operations, fuel consumption and aircraft miles flown. GRA

02 AERODYNAMICS

A NUMERICAL AND EXPERIMENTAL STUDY OF THE TURBULENT WAKES OF TURBOMACHINERY ROTOR BLADES, ISOLATED AIRFOILS, AND A CASCADE OF AIRFOILS Ph.D. Thesis
Chunill Hah 1980 341 p
Avail: Univ. Microfilms Order No. 8015798

Three turbulence models were employed to obtain closure of the governing equations. The first model was comprised of transport equations for the turbulent kinetic energy and the rate of energy dissipation, and the second and third models were comprised of equations for the rate of turbulent kinetic energy dissipation and Reynolds stresses, respectively. The second model handles the convection and diffusion terms in the Reynolds stress transport equation collectively, while the third model handles them individually. All three models were modified for the effect of streamline curvature. The rotation originated redistribution terms were added in the transport equation of Reynolds stresses of the second and third models. The turbulent wakes of an isolated airfoil and a cascade of airfoils are handled as simpler cases of the general rotating three dimensional wake. The numerical results demonstrate that the second and third models provide accurate predictions, but the computer time and memory storage can be considerably saved with the second model. Dissert. Abstr.

N80-27278 California Univ., Los Angeles.
AIRFOILS AT SONIC VELOCITY Ph.D. Thesis
Egbert Sau-Nam Tse 1980 103 p
Avail: Univ. Microfilms Order No. 8016054

A method for calculating flows and corresponding airfoils shapes where the free-stream Mach number is unity is described.

The calculation is done in two parts: both are on hodograph planes. The basic equation is the Tricomi equation and is solved numerically. In one part which corresponds to the front section of the airfoil, the equation is solved in a region where it changes type. The algorithm developed is thus type dependent. The implicit difference scheme formulates uses a rectangular grid in the elliptic region and a characteristic grid in the hyperbolic region. In the other part which corresponds to the rear part of the airfoil, a method of characteristics is used. The boundary curve is prescribed in the hodograph and the shape of the airfoil is determined afterwards. This is useful in airfoil design. The computed result for a thin wedge is in good agreement with analytic results obtained by others. Airfoil with convex surfaces and parabolic noses are generated. Their center of pressure distribution, lift coefficient, drag coefficient and moment coefficient are also obtained. Dissert. Abstr.

TRANSONIC SMALL DISTURBANCES EQUATION APPLIED TO THE SOLUTION OF TWO-DIMENSIONAL NONSTEADY FLOWS
M. Couston, J. J. Angelini, and P. Mulak Apr. 1980 36 p refs Transl. into ENGLISH from la Rech. Aerospatiale, no. 5, Sep. - Oct. 1979 p 325-340 Original document prepared by ONERA Original language document announced as A80-12357 Transl. by Kannar (Leo) Associates, Redwood City, Calif.
(Contract NASw-3199)
(NASA-TM-75795) Avail: NTIS HC A03/MF A01 CSCL 20D

Transonic nonsteady flows are of large practical interest. Aeroelastic instability prediction, control figured vehicle techniques or rotary wings in forward flight are some examples justifying the effort undertaken to improve knowledge of these problems is described. The numerical solution of these problems under the potential flow hypothesis is described. The use of an alternating direction implicit scheme allows the efficient resolution of the two dimensional transonic small perturbations equation L.F.M.

EXPLORATORY STUDIES OF THE CRUISE PERFORMANCE OF UPPER SURFACE BLOWN CONFIGURATIONS Final Summary Report
J. A. Braden, J. P. Hancock, J. E. Hackett, K. P. Burdges, and V. Lyman Washington NASA Jul. 1980 191 p refs
(Contract NAS1-13871)
(NASA-CR-3193; LG77ER0028) Avail: NTIS HC A09/MF A01 CSCL 01A

The data and major conclusions obtained from an experimental/analytical study of upper-surface blown (USB) configurations at cruise are summarized. The high-speed (subsonic) experimental work, studying the aerodynamic effects of wing-nacelle geometric variations, was conducted around semi-span model configurations composed of diversified, interchangeable components. Power simulation was provided by high pressure air ducted through closed forebody nacelles. Nozzle geometry was varied across size, exit aspect ratio, exit position and boattail angle. Both 3-D force and 2-D pressure measurements were obtained at cruise Mach numbers from 0.5 to 0.8 and at nozzle pressure ratios up to about 3.0. The experimental investigation was supported by an analytical synthesis of the system using a vortex lattice representation with first-order power effects. Results are also presented from a compatibility study in which a short-haul transport is designed on the basis of the aerodynamic findings in the experimental study as well as acoustical data obtained in a concurrent program. High-lift test data are used to substantiate the projected performance of the selected transport design. A.R.H.

AN IMPROVED PANEL METHOD FOR THE SOLUTION OF THREE-DIMENSIONAL LEADING-EDGE VORTEX FLOWS. VOLUME 1: THEORY DOCUMENT Topical Report, Dec. - May 1977
F. T. Johnson, P. Lu, and E. N. Tinoco Washington NASA Jul. 1980 123 p refs
(Contract NAS1-15169; NAS1-15275)
(NASA-CR-3278) Avail: NTIS HC A06/MF A01 CSCL 01A

An improved panel method for the solution of three dimensional flow and wing and wing-body combinations with leading edge vortex separation is presented. The method employs a three dimensional inviscid flow model in which the configuration, the rolled-up vortex sheets, and the wake are represented by quadratic doublet distributions. The strength of the singularity distribution as well as shape and position of the vortex spirals are computed in an iterative fashion starting with an assumed initial sheet geometry. The method calculates forces and moments as well as detail surface pressure distributions. Improvements include the implementation of improved panel numerics for the purpose of elimination the highly nonlinear effects of ring vortices around double panel edges, and the development of a least squares procedure for damping vortex sheet geometry update instabilities. A complete description of the method is included. A variety of cases generated by the computer program implementing the method are presented which verify the mathematical assumptions of the method and which compare computed results with experimental data to verify the underlying physical assumptions made by the method. EFFECT OF REYNOLDS NUMBER ON STABILITY CHARACTERISTICS OF A CRUCIFORM WING-BODY
Robert L. Stallings, Jr., Milton Lamb, and Carolyn B. Watson Jul. 1980 111 p refs
(NASA-TP-1683; L-13530) Avail: NTIS HC A06/MF A01 CSCL 01A

An experimental investigation was conducted to determine the effect of Reynolds number on the stability characteristics of a body with cruciform wings at large angles of attack. Pressure distributions and force and moment data (axial force not measured) are presented for Mach 1.60 and 2.70, Reynolds numbers based on body diameter from approximately 130,000 to 2,800,000, and angles of attack from 0 deg to 50 deg. In general, the data show only small effects of Reynolds number throughout the range of test condition. Also discussed are force balance and pressure data that suggest a direct relationship between wind choking and the onset of a nonlinear stability variaton with angle of attack. Author

CAS2D: FORTRAN PROGRAM FOR NONROTATING BLADE-TO-BLADE, STEADY, POTENTIAL TRANSONIC CASCADE FLOWS
Djordje S. Dulikravich Jul. 1980 36 p refs
(NASA-TP-1705; E-253) Avail: NTIS HC A03/MF A01 CSCL 01A

An exact, full-potential-equation (FPE) model for the steady, irrotational, homentropic and homoenergetic flow of a compressible, homocompositional, inviscid fluid through two dimensional planar cascades of airfoils was derived, together with its appropriate boundary conditions. A computer program, CAS2D, was developed that numerically solves an artificially time-dependent form of the actual FPE. The governing equation was discretized by using type-dependent, rotated finite differencing and the finite area technique. The flow field was discretized by providing a boundary-fitted, nonuniform computational mesh. The mesh was generated by using a sequence of conforming mapping,

nonorthogonal coordinate stretching, and local, isoparametric, bilinear mapping functions. The discretized form of the FPE was solved iteratively by using successive line overrelaxation. The possible isentropic shocks were correctly captured by adding explicitly an artificial viscosity in a conservative form. In addition, a three-level consecutive, mesh refinement feature makes CAS2D a reliable and fast algorithm for the analysis of transonic, two dimensional cascade flows. Author

AN ALTERNATIVE APPROACH TO THE NUMERICAL SIMULATION OF STEADY INVISCID FLOW
Gary M. Johnson Jun. 1980 8 p refs Presented at 7th Intern. Conf. on Numerical Methods in Fluid Dyn., Stanford, Calif., 23-27 Jun. 1980; sponsored by NACA, AFOSR, NSF, and ONR
(NASA-TM-81542) Avail: NTIS HC A02/MF A01

A numerical procedure for the efficient simulation of steady inviscid flow is described and its utility demonstrated. Application of the surrogate equation technique allows the formulation of stable, fully conservative, type dependent finite difference equations for use in obtaining numerical solutions to systems of first order partial differential equations, such as the steady state Euler equations or their various approximations. Computational results are presented for the full Euler equations and for the transonic disturbance equations. For the latter case, a computational efficiency greater than that obtained by means of the standard perturbation potential approach is indicated. E.D.K.

EXPERIMENTAL STUDIES OF SCALE EFFECTS ON OSCILLATING AIRFOILS AT TRANSONIC SPEEDS
Sanford S. Davis Jul. 1980 16 p refs
(NASA-TM-81216; A-8259) Avail: NTIS HC A02/MF A01 CSCL 01A

Experimental data are presented on the effect of Reynolds number on unsteady pressures induced by the pitching motion of an oscillating airfoil. Scale effects are discussed with reference to a conventional airfoil (NACA 64A010) and a supercritical airfoil (NLR 7301) at mean-flow conditions that support both weak and strong shock waves. During the experiment the Reynolds number was varied from 3,000,000 to 12,000,000 at a Mach number and incidence necessary to induce the required flow. Both fundamental frequency and complete time history data are presented over the range of reduced frequencies that is important in aeroelastic applications. The experimental data show that viscous effects are important in the case of the supercritical airfoil at all flow conditions and in the case of the conventional airfoil under strong shock-wave conditions. Some frequency-dependent viscous effects were also observed. Author

THREE DIMENSIONAL MEAN FLOW AND TURBULENCE CHARACTERISTICS OF THE NEAR WAKE OF A COMPRESSOR ROTOR BLADE Final Report
A. Ravindranath and B. Lakshminarayana Jun. 1980 298 p refs
(Grant NsG-3012)
(NASA-CR-159518; PSU-TURBO-R-80-4) Avail: NTIS HC A13/MF A01 CSCL 01A

The investigation was carried out using the rotating hot wire technique. Measurements were taken inside the end wall boundary layer to discern the effect of annulus and hub wall boundary layer, secondary flow, and tip leakage on the wake structure. Static pressure gradients across the wake were measured using a static stagnation pressure probe insensitive to flow direction changes. The axial and the tangential velocity defects, the radial component of velocity, and turbulence intensities were found to be very large as compared to the near and far wake regions. The radial velocities in the trailing edge region exhibited characteristics prevalent in a trailing vortex system. Flow near the blade tips found to be highly complex due to interaction of the end wall boundary layers, secondary flows, and tip leakage flow with the wake. The streamwise curvature was found to be appreciable near the blade trailing edge. Flow properties in the trailing edge region are quite different compared to that in the near and far wake regions with respect to their decay characteristics, similarity, etc. Fourier decomposition of the rotor wake revealed that for a normalized wake only the first three coefficients are dominant. E.D.K.

(Contract N00019-79-C-0087)
(AD-A083766; DDA-EDR-10192) Avail: NTIS HC A06/MF A01 CSCL 20/4

A cascade of five airfoil sections modelling the hub section of an advanced design turbine featuring a high inlet Mach number and 112 degrees of turning was evaluated at 4 steady-state conditions of varying exit Mach number and expansion ratio. The resulting steady-state airfoil surface pressures were compared to a state-of-the-art analytical prediction. A time-variant investigation was conducted at the 4 operating conditions of the steady-state experiment. Time-variant pressure signals were obtained from a Kulite-instrumented airfoil as the cascade was torsionally oscillated at four values of interblade phase angle per expansion ratio by computer-controlled electromagnetic drive systems. The dynamic pressure signals were evaluated in amplitude and phase lag (referenced to blade motion) and correlated with a state-of-the-art analytical prediction based on a flat-plate cascade. A quasi-static experiment was performed to relate the dynamic surface pressure amplitudes to those obtained by resetting the cascade to various temporal positions in the torsional cycle of oscillation. DATA REPORT FOR AN EXTENSIVE STORE SEPARATION TEST PROGRAM CONDUCTED AT SUPERSONIC SPEEDS Final Report, Jun. 1975 - Aug. 1979
Frederick K. Goodwin and Calvin L. Dyer (AFFDL) Wright-Patterson AFB, Ohio AFFDL Dec. 1979 292 p refs
(Contract F33615-76-C-3077; AF Proj. 2403)
(AD-A083848; NEAR-TR-205; AFFDL-TR-79-3130) Avail: NTIS HC A13/MF A01 CSCL 20/4

This report describes an extensive store separation test program conducted at Mach number range covering 1.5 to 2.5. The purpose of the program was to provide a systematic set of data which could be used to evaluate and improve analytical techniques for predicting supersonic store separation trajectories. Parent aircraft configurations tested ranged from a simple circular body, mid-wing configuration without pylons and racks to a noncircular fuselage with wing, flow through engine inlets, and pylons and racks. The parent configuration was built up component by component so model component effects could be isolated. Flow-field survey, store pressure-distribution, store force-and-moment and store trajectory data were obtained. The store tested were circular and elliptical in cross section with various fin arrangements. The data obtained during five wind-tunnel entries are summarized in this report. The data have been collected on magnetic tapes and FORTRAN computer programs have been written which retrieve the data from the tapes. This report also describes the use of these programs and tapes and describes the tabulated output from the programs. GRA

FLUTTER ANALYSIS OF A TWO-DIMENSIONAL AND TWO-DEGREE-OF-FREEDOM SUPERCRITICAL AIRFOIL IN SMALL-DISTURBANCE UNSTEADY TRANSONIC FLOW Final Report, Nov. 1978 - Oct. 1979
T. Y. Yang, P. Guruswamy, and Alfred G. Striz Wright-Patterson AFB, Ohio AFWAL Mar. 1980 94 p refs
(Grant AF-AFOSR-3523-78; AF Proj. 2307)
(AD-A084172; AFWAL-TR-80-3010) Avail: NTIS HC A05/MF A01 CSCL 20/4

Flutter analysis is performed for a MBB A-3 supercritical airfoil at transonic Mach numbers. Two degrees of freedom, pitching and plunging, are considered. The unsteady aerodynamic data are obtained by using two separate transonic aerodynamic computational codes: (1) LTRAN2 based on the time integration method and (2) STRANS2 and UTRANS2 based on the harmonic analysis method. The steady aerodynamic results are shown in the form of upper and lower surface pressure curves. The unsteady aerodynamic coefficients are obtained and tabulated for various values of low reduced frequency by pitching the MBB A-3 airfoil about the quarter chord axis. For the case of zero mean angle of attack, the coefficients obtained by the two computer codes are directly compared and discussed. At design Mach number of 0.765 and zero mean angle of attack, flutter results are obtained by both methods and compared. They are presented as plots of flutter speed and the corresponding reduced frequency vs. one of the four parameters: airfoil - air mass ratio; position of mass center; position of elastic axis; and plunge-to-pitch frequency ratio. THE LOW-SPEED CHARACTERISTICS OF A 15-PERCENT QUASI-ELLIPTICAL CIRCULATION CONTROL AIRFOIL WITH DISTRIBUTED CAMBER Final Report
Jane Abramson May 1979 46 p refs
(AD-A084176; DTNSRDC/ASED-79/07) Avail: NTIS HC A03/MF A01

The aerodynamic characteristics of a circulation control elliptic airfoil section with a 15-percent thickness-to-chord ratio were evaluated subsonically. The airfoil, designated NCCR1513-7559E, incorporates a high degree of nose camber and an increased leading edge radius in a profile designed for high subsonic speeds. Critical Mach numbers in excess of 0.7 were predicted analytically for several typical operating conditions. Lift coefficients up to 4.63 were produced at momentum coefficients of 0.22. Equivalent lift-to-drag ratios of approximately 40 were also produced at C_{μ} = 0.8. GRA

NUMERICAL OPTIMIZATION OF CIRCULATION CONTROL AIRFOILS Interim Report, Sep. 1978 - Dec. 1979
Tsze C. Tai, George H. Kidwell, Jr., and Garret N. Vanderplaats Apr. 1980 51 p refs
(ZR0230201)
(AD-A084129; DTNSRDC/AERO-1265; DTNSRDC-80/060) Avail: NTIS HC A04/MF A01 CSCL 20/4

A numerical procedure developed for optimizing the circulation control airfoils is presented. The procedure finds the optimum basis airfoil shapes subjected to specified flow conditions and geometric constraints. It consists of a numerical optimization code for linear constrained problems coupled with a viscous-potential flow interaction analysis for necessary viscous-inviscid flow field calculations. The desired airfoil shape is defined by a combination of baseline shapes representative of airfoils suitable for circulation control purposes. The coefficients of these basis vectors are then used as the design variables in the optimization process. Three baseline shapes (a cambered ellipse, a cambered ellipse with a drooped trailing edge, and a cambered ellipse with a logarithmically spiralled trailing edge) are employed for special contouring of the trailing edge geometry. With some minor modification of the analysis method, the combined program allows optimization for maximum lift without substantial difficulty; but for minimizing the drag, further improvement of the analysis method is required. A SECOND ORDER ACCURATE NUMERICAL METHOD FOR SUPERSONIC BOUNDARY LAYER FLOW PAST A COMPRESSION CORNER M.S. Thesis. Final Report, May 1978 - May 1979
Bernardo Fortunato and M. J. Werle Jun. 1979 91 p refs
(Contract F33615-76-C-3091; AF Proj. 2307)
(AD-A084550; AFFDL-TR-79-3061) Avail: NTIS CSCL 20/4

The compressible and incompressible boundary layer equations are solved for laminar flow past a configuration with an interior (concave) compression region. The approach first employs conformal coordinates to map the body geometry to a flat wall, and then the boundary layer scale laws to identify the principal terms of the compressible counterpart of the Navier-Stokes equations. A Levy-Lees type transformation is identified in these coordinates to simplify the governing equations. These are then solved with a second order accurate numerical scheme in both the longitudinal and normal directions. Solutions are obtained for adiabatic and 'warm' wall conditions for configurations with and without separation. Emphasis is placed here on achieving accurate reliable results while maintaining minimal computer time expenditure. GRA

MUTUAL INTERFERENCE OF MULTIPLE BODIES IN THE FLOW FIELD OF THE F-4C AIRCRAFT IN THE TRANSONIC SPEED RANGE Final Report, 12 - 21 Nov. 1979
A. A. Hesketh AEDC Dec. 1979 90 p refs
(AD-A084704; AEDC-TSR-79-P79) Avail: NTIS HC A05/MF A01 CSCL 20/4

A wind tunnel field was conducted to study the mutual interference of multiple bodies in the flow field of the F-4C aircraft. The test utilized 1/20 scale models of the F-4C aircraft, the MK-83 bomb (with and without fins) and the triple ejector rack (TER) to obtain aerodynamic loads on the MK-83 at, and near, the carriage position on the wing inboard pylon. Flow field data in the vicinity of the TER were also obtained. Test variables included aircraft angle of attack from -3 to 17 deg, freestream Mach number from 0.60 to 0.95, and aircraft configuration. Freestream aerodynamic loads data were also obtained on the MK-83 bomb model. GRA

GAS REPLENISHMENT TECHNIQUES FOR USE IN HIGH-ALTITUDE, LONG-DURATION SCIENTIFIC BALLOON FLIGHTS Final Report
Andrew S. Cartan, Jr. and Charles F. Sindt 14 Nov. 1979 78 p refs
(AD-A084496; AFGL-TR-79-0278; AFGL-IP-283) Avail: NTIS HC A05/MF A01 CSCL 20/4

This report covers the theoretical advantages and practical ramifications of a proposed new technique for compensating for the daily loss of lift (gamma) experienced by long-duration high-altitude scientific balloon flights. This technique, 'Gas Replenishment' would transfer stored helium from an onboard dewar to the balloon, to replace gas lost due to temperature excursions. It would be a direct substitute for systems presently in use which drop ballast, that is, reduce system gross weight, to compensate for loss of lift. With gas replenishment, lift is restored directly, with only a small change in system gross weight. A short summary of zero pressure balloon flight theory is given at the start, to lead into the explanation of conventional ballast

practices and computations. The ballast equations are then modified to apply to the gas replenishment technique. Calculations for typical constant-gamma flights are summarized for each method of loss compensation and the clear superiority of gas replenishment is demonstrated in the areas of gross system weight of launch, usable payload weight and anticipated flight duration. Basic equations are then developed for a more complicated model of the gas replenishment system in which the value of gamma varies from day to day. Computations using these formulas are summarized in tabular form. The final section of the report is given over to the design problems associated with the type of dewar and heat exchange equipment needed to implement the gas replenishment concept. GRA

TIRE STIFFNESS AND DAMPING DETERMINED FROM STATIC AND FREE-VIBRATION TESTS
Robert K. Sleeper and Robert C. Dreher Jul. 1980 45 p refs
(NASA-TP-1671; L-13500) Avail: NTIS HC A03/MF A01 CSCL 01C

Stiffness and damping of a nonrolling tire were determined experimentally from both static force-displacement relations and the free-vibration behavior of a cable-suspended platen pressed against the tire periphery. Lateral and force-and-aft spring constants and damping factors of a 49 x 17 size aircraft tire for different tire pressure and vertical loads were measured assuming a rate-independent damping form. In addition, a technique was applied for estimating the magnitude of the tire mass which participates in the vibratory motion of the dynamic tests. Results show that both the lateral and force-and-aft spring constants generally increase with tire pressure but only the latter increased significantly with vertical tire loading. The fore-and-aft spring constants were greater than those in the lateral direction. The static-spring-constant variations were similar to the dynamic variations but exhibited lower magnitudes. Damping was small and insensitive to tire loading. Furthermore, static damping accounted for a significant portion of that found dynamically. Effective tire masses were also small. Author

THE 1976 ACCIDENT EXPERIENCE OF CIVILIAN PILOTS WITH STATIC PHYSICAL DEFECTS
J. Robert Dille and Charles F. Booze Aug. 1979 8 p refs
(AD-A077189; FAA-AM-79-19) Avail: NTIS HC A02/MF A01 CSCL 01/2

The 1974 and 1975 aircraft accident experiences of civilian pilots with eight selected static physical defects have been examined and reported previously. Three categories, blindness or absence of either eye, deficient color vision with a waiver, and deficient distant vision, had significantly more accidents than were expected on the basis of observed-to-expected ratios. However, pilots with these conditions reported considerably higher median 6-month flight times than did an active airman population sample and accident airmen without selected pathology. In 1975 the reported recent and total flying times for all airmen with these defects were determined and accident rates were calculated. The rates for airmen with blindness or absence of an eye were still found to be significantly higher. The contact lens group was also selected to receive special attention in a study of the 1976 accident data because marginal significance was found on analysis of the 1975 data and, after 1976, this group will not carry a pathology code or require a waiver and thus will be difficult to study. Observed-to-expected ratios for

1976 are 1.91 for deficient color vision with a waiver, 1.28 for contact lens users, 1.37 for blindness or absence of either eye, and 1.62 for deficient distant vision. The accident rates per 100,000 hours of cumulative and last 6 months' flying experience were significantly greater for contact lens users and monocular pilots than for the active airman population. Busy hour estimates are obtained from periodic counts of 60 minutes in duration. These counts are made during known high activity periods for each traffic category. From this sample, tower personnel select a count which is representative of daily busy hour activity for each category. The statistical tables in this publication contain traffic estimates for each airport at which an air traffic control tower operated during all of FY 1977 and FY 1978. Provided with peak day and busy hour counts are average day and hour operations computed from the annual operations counts. Measures of peaking characteristics are given by the ratios peak day to average day and busy hour to average hour by individual airport by size group. GRA

CHICAGO MONOSTATIC ACOUSTIC VORTEX SENSING SYSTEM. VOLUME 1: DATA COLLECTION AND REDUCTION Final Report, Jan. 1976 - Sep. 1977
D. C. Burnham Oct. 1979 34 p refs
(AD-A076929; TSC-FAA-79-18-1-Vol-1; FAA-RD-79-103-1) Avail: NTIS HC A03/MF A01 CSCL 20/4

A Monostatic Acoustic Vortex Sensing System MAVSS was installed at Chicago's O'Hare International Airport to measure the strength and decay of aircraft wake vortices from landing aircraft. The MAVSS consists of an array of acoustic antennas which measure the vertical profile up to 60 m altitude of the vertical component of the wind. The decay in wake vortex strength is measured as the vortex passes over successive antennas in the array. Volume I describes the MAVSS principles of operation, the hardware developed, and data reduction methods employed. GRA

WEST COAST LORAN-C FLIGHT TEST Final Report
Thomas E. Scalise, Erich Bolz, and Edwin D. McConkey Mar. 1980 209 p refs
(Contract DOT-FA75WA-3662)
(AD-A084039; FAA-RD-80-28) Avail: NTIS HC A10/MF A01 CSCL 17/7

A flight test program was flown within the coverage area of the West Coast Loran-C chain during June and July 1979. The purpose of the test was to add to the growing statistical data base that will be used to assess Loran-C as a supplement to, or replacement for, the present VOR/DME navigation system. The test objectives were to: (1) Evaluate the West Coast Loran-C chain by quantifying navigation and position errors within its coverage area; (2) Test Loran-C as a non-precision approach aid in mountainous conditions, using a commercially available Loran-C receiver/navigator, in this case a Teledyne TDL-711; (3) Record the effects of bias shifts and station outages on overall accuracy and approach procedures, especially near a baseline extension; (4) Calculate the absolute flight technical error (FTE) during Loran-C approaches using a typical general aviation aircraft. The main conclusions of the test were: The West Coast Loran-C chain appears stable and dependable. Time difference errors were consistent and related to signal propagation differences over land and over water; TDL-711 was found to be easy to operate, giving stable and repeatable course guidance, although susceptible to random loss of track, a problem which may be software related. The system did not accurately calculate cross track deviation and distance to waypoint. Without needed hardware, software, and/or procedural changes, Loran-C may not meet the RNAV non-precision approach requirements of AC 90-45A. GRA

ATARS/ATC SIMULATION TESTS WITH SITE ADAPTATION LOGIC IN THE PHILADELPHIA TERMINAL AREA Final Report, May - Oct. 1978
Gary W. Morfitt, Sidney B. Rossiter, James R. Windle, Arthur W. Fillius, and Thomas A. Choyce Mar. 1980 56 p refs
(FAA Proj. 034-242-340)
(AD-A083718; FAA-NA-79-23; FAA-RD-79-116) Avail: NTIS HC A04/MF A01 CSCL 17/7

The purpose of this project was to provide further evaluation and refinement of the Automatic Traffic Advisory and Resolution Service (ATARS) concept. The tests were conducted at the National Aviation Facilities Experimental Center (NAFEC) at Atlantic City, New Jersey, using the Air Traffic Control Simulation Facility (ATCSF). Test results indicated that ATARS had no significant impact on the controllers or control procedures in a Philadelphia Terminal Control Area (TCA) environment. Outside the immediate TCA, where the majority of encounters occurred, the factors contributing to the generation of alarms were, in general, satellite operations and the use of Visual Flight Rules (VFR) separation criteria. The incidence of positive resolution advisories was low, averaging only 0.5 encounters per hour. Recommendations are to reduce the size of the ATARS desensitization zone at the Philadelphia main airport to approximately 2.0 nautical miles (nmi) from runway thresholds, to incorporate a convergence/divergence detection filter into the ATARS algorithm, and to investigate the possibility of reducing tracker lag by improving turn and level off detection. FEASIBILITY OF OFFSET CARRIER SYSTEMS FOR AIR TRAFFIC CONTROL Interim Report
J. David Claiborne Oct. 1979 17 p refs
(Contract DOT-FA78WAI-830)
(AD-A084044; FAA-RD-79-106; IR-2) Avail: NTIS HC A02/MF A01 CSCL 17/7

A brief description of FAA trials of offset carriers systems and multiple outlet systems is given. Short descriptions are also given of existing offset carrier systems in Great Britain and the ARINC system in the United States. The communication deficiencies that could be remedied by an offset carrier system are listed. A short discussion is given concerning the system design deficiencies inherent with an offset carrier system. No conclusions are made concerning the usefulness or practicality of an offset carrier system. GRA

AN EVALUATION OF AIRCRAFT SEPARATION ASSURANCE CONCEPTS USING AIRLINE FLIGHT SIMULATORS. VOLUME 1: STUDY REPORT Final Report
Bruce Morgenstern and Thomas P. Berry Nov. 1979 108 p
(Contract DOT-FA78WA-4091)
(AD-A083986; Rept-1343-01-3-2058-Vol-1; FAA-RD-79-124-1) Avail: NTIS HC A06/MF A01 CSCL 01/2

This report documents an evaluation of Aircraft Separation Assurance (ASA) concepts using an airline flight simulator. The primary objective of the experiment was to determine the cockpit information requirements for an aircraft collision avoidance system. Qualified pilots from commercial aviation and industry flew typical operational scenarios in the simulated Los Angeles area. During the flight, conflict situations with other aircraft developed, and pilots were asked to respond to these situations on the basis of

information presented to them by one of three experimental collision avoidance displays. Computer-collected data on pilot response to collision avoidance commands and resultant miss distances were correlated with data from questionnaires filled out by participating pilots to determine the cockpit information requirements. The subjective commments addressed the areas of required display information items, use of color, audible alert, symbols, workload, pilot confidence in the system, and pilot display preference. Altitude, range, relative bearing, and other aircraft heading have been identified as the most important and most essential information elements in the resolution of potential conflicts. The report provides a statistical analysis of the accumulated data and includes recommendations for the development and operational implementation of the ASA program. GRA

IN-SERVICE IMPROVEMENTS TO RELIABILITY AND MAINTAINABILITY OF THE INSTRUMENT LANDING SYSTEM Final Report, Oct. 1977 - May 1979
May 1979 487 p refs
(Contract DOT-FA78WA-4062)
(AD-A075556; EER-40-1; FAA-R-6750.2; FAA-AAF-420) Avail: NTIS HC A21/MF A01 CSCL 17/7

This report documents results of task efforts undertaken by Ohio University between October 1977 and May 1979. Engineering data resulting from a study of the sideband reference, glide-slope system baseline operating parameters and the effects of specific faults are presented. A series of perturbational studies conducted at commissioned sideband reference facilities and numerous field experiments at Ohio University's Tamiami, Florida site facility are described. Suggested technical improvements and text changes for existing technical manuals have also resulted. The effects of a wide range of terrain profiles on the performance of sideband reference, null reference, and capture effect systems are compiled in album form. Sideband reference system setup procedures are reviewed, the electrical and physical requirements for the counterpoise are explored, and an introductory look at threshold-plane DDM profiles is presented. ILS anomaly investigations have resulted in the design, testing, and implementation of a modification to the Type FA-5723 clearance transmitter. Also, predictions of complete glide-slope performance for a proposed site on Runway 22L at Boston Logan are presented. The maximum allowable VSWR for the 15-element V-Ring and the O-Ring localizers are investigated based on theoretical and experimental work. The findings are that the maximum VSWR is not that of a simple specification but rather that of values that are within the bounds of worst and best-case conditions depending on the value of the complex reflection coefficient. POTENTIAL USE OF HIGH FREQUENCY DATA TRANSMISSION FOR OCEANIC AIR TRAFFIC CONTROL IMPROVEMENT Final Report, Aug. 1978 - Jul. 1979
Martin Nesenbergs Sep. 1979 48 p refs
(Contract DOT-FA-RA-78-15)
(AD-A075810; FAA-AM-TSC-79-9) Avail: NTIS HC A03/MF A01 CSCL 17/2

This report is concerned with the transatlantic Air Traffic Control (ATC) data links in the high frequency (HF) band. The report tries to broaden the appropriate communication system concepts by fortifying them with general parametric objectives. While such a broad approach cannot escape practical constraints and reductions, especially in eventual design and implementation stages, it is nevertheless a useful tool here. It leads one to characterize the HF propagation medium more fully. This in turn enables one to conceive data communications outlines with more advanced structures and with emphasis on exploiting the latest technology, both hardware and software. A full study should be beyond this initial effort and incorporate several system alternatives, plus their tradeoffs in terms of objective gains versus system costs. This brief report concludes with a parametric summary of ATC HF channel issues, operational factors, and the importance of performance specification. Pertinent unresolved issues are also listed at the end. GRA

ANALYSIS OF EXPANDABILITY AND MODIFIABILITY OF COMPUTER CONFIGURATION CONCEPTS FOR ATC. VOLUME 1: DISTRIBUTED CONCEPT Final Report
David F. Clapp, Joseph B. Hagopian, and Ronald M. Rutledge Nov. 1979 195 p refs
(AD-A084045; TSC-FAA-79-31; FAA-EM-79-22-Vol-1) Avail: NTIS HC A09/MF A01 CSCL 17/7

The questions of expandability and modifiability of a 1990-era Air Traffic Control (ATC) system are addressed. Two strawman systems are described at the functional level: a Baseline System, which represents the ATC system as it might be just after the replacement of the current National Airspace System (NAS) en route computers, and a Future System, which represents what might be derived ten years later under an appropriate scenario for ATC development. A distributed processing computer configuration is postulated for the Baseline System, and processing and communications loads are calculated on the basis of traffic and parameter estimates for 1985. Expansion and modification of the Baseline System to produce the Future System designed to meet estimated 1995 loads under the supplied scenario are examined. The distributed processing concept, as considered here, was deemed generally suitable for use in the ATC system of the future. GRA

AN INVESTIGATION OF LASER LIGHTING SYSTEMS TO ASSIST AIRCRAFT LANDING Final Report, Oct. 1978 - Sep. 1978
D. C. Burnham and J. F. Fantasia Oct. 1979 64 p refs
(AD-A077722; TSC-FAA-79-22; FAA-RD-79-97) Avail: NTIS HC A04/MF A01 CSCL 17/7

A model for the visual detectability of narrow light beams was developed and used to evaluate the system performance of two laser lighting system configurations: (1) a laser VASI and (2) a crossed beam glide path indicator. Laboratory experiments confirmed the validity of the model. Using a criterion taken from the Federal Standard for laser safety, the potential hazards of each of the system concepts were evaluated. The following results were obtained for readily available laser power levels: neither system will work during bright daylight, the laser VASI can be seen at night at the middle marker for visual ranges greater than 5000 ft, the crossed beam system can be seen at night at the middle marker for visual ranges greater than 700 ft. TESTS OF AN ATCRBS BASED TRILATERATION SENSOR AT LOGAN INTERNATIONAL AIRPORT Final Report, Oct. 1977 - Sep. 1978
P. E. Manning Nov. 1979 65 p
(AD-A078979; TSC-FAA-79-12; FAA-RD-79-115) Avail: NTIS HC A04/MF A01 CSCL 17/7

Field test results of accuracy and coverage for an ATCRBS based surface trilateration sensor at Logan International Airport are described. This sensor was previously tested at NAFEC for feasibility and because of a lack of sufficient aircraft traffic and multipath, further tests were recommended at an operational airport. These tests show that a beacon trilateration sensor can accurately determine the position of a transponder equipped vehicle on the surface, extract its beacon code and provide

excellent coverage without interference with the operational ATCRBS. GRA

PRECISION NAVIGATION FOR AIR TRAFFIC MANAGEMENT
S. Radcliffe Oct. 1979 9 p refs Presented at the AGARD GCP Symp., Copenhagen, 29 Oct. 1979
(AD-A083947; RSRE-Memo-3220; DRIC-BR72506) Avail: NTIS HC A02/MF A01 CSCL 17/7

This report discusses the problems that would arise if airspace users had the use of NAVSTAR or some other much better position fixing aid than at present, and the uses that ATC could, or could not, make of this capability. There would be formidable transitional problems in the vertical plane, because NAVSTAR measures height from the Earth's center whereas current altimeters measure atmosphere pressure. In either vertical or horizontal planes much work will be necessary to prove that the separation standards can be reduced at all. The paper discusses changes that might be possible in the ATC system should appreciable reductions in separation standards prove possible. NAVSTAR might form the basis of a collision avoidance system based on either the broadcast coordinates of each aircraft or on a time-frequency basis using NAVSTAR as the time reference. The latter scheme would offer protection of a fully equipped aircraft against a threat that could not afford the expense of a NAVSTAR fit. This paper is a contribution to the 29th AGARD GCP Symposium, Copenhagen, Oct 1979. It is issued as a memo to make it available earlier and in an unclassified document. GRA

ENHANCED TERMINAL INFORMATION SERVICES (ETIS) UTILIZING THE DISCRETE ADDRESS BEACON SYSTEM (DABS) DATA LINK-CONCEPT DESCRIPTION Final Report, Sep. 1978 - Apr. 1979
Robert W. Wisleder Jul. 1979 90 p refs
(AD-A073205; TSC-FAA-79-11; FAA-RD-79-73) Avail: NTIS HC A05/MF A01 CSCL 17/7

This report describes a concept for providing enhanced terminal information services (ETIS) to aircraft utilizing the ground-air-ground data link capability of the Discrete Address Beacon System (DABS). ETIS is envisioned as an eventual replacement for, and significant improvement to the Automated Terminal Information Services (ATIS) in use today. The initial step in developing the concept is the establishment of requirements for an ETIS system. This is followed by a determination of the information and data to be provided to the aircraft over the data link, and the probable sources of that data. An assumption is made that the availability of automated weather sensor systems of some form will coincide with implementation of ETIS. A detailed functional description of the system is then given, including system configuration, interfaces with other ATC automation systems, and hardware and software both at the airport and at the controlling ATC facility. Also discussed are message content and formats, controller and pilot display design considerations, criteria for dispatch of ETIS messages, and a number of operational considerations. The report concludes with several typical flight scenarios representative of different levels of aircraft, avionics, and pilot capabilities in an air traffic control environment where ETIS is implemented. PROBABILITIES OF VERTICAL OVERLAP: A SENSITIVITY ANALYSIS
Howard K. Hung, Judith F. Gilsinn, and Karla F. Hoffman Mar. 1980 72 p refs Sponsored in part by FAA, Washington, DC.
(PB80-161151; NBSIR-80-1990) Avail: NTIS HC A04/MF A01 CSCL 01C

Because of the potential increase in traffic at FL 290 and above, both current and alternative vertical separation standards are being reviewed. A sensitivity analysis carried out to assess how different assumptions about the probability distribution of 'total vertical error' affect the probability of vertical overlap is documented. The four factors affecting the probability of vertical overlap which are examined are: the functional form of the vertical-error distribution function; the standard deviation of this probability distribution; the vertical dimensions of the aircraft; and the vertical separation standard. Probabilities of vertical over-lap were computed over a range of possibilities for each of these four factors in order to discern the effect of each factor. GRA

HELICOPTER AIR TRAFFIC MANAGEMENT SYSTEMS WITH CIVIL/MILITARY INTEROPERABILITY
Joseph T. Saganowich *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 16 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

In order to achieve significant near-term improvement in the Army's air traffic management capability, several configurations of 'very lightweight air traffic management equipment' (VLATME) were developed. Based upon totally compatible use of today's common civil/military system ATCRBS (air traffic control radar beacon system). Concurrently with the VLATME development, helicopter instrument landing technology work over the past few years has revealed that the key to solving this problem lies in the ability to perform deceleration of the aircraft on instruments, along the approach path, so as to bring the aircraft to a hover a few feet above the intended landing point. The decelerated instrument approach means that helicopter spacings will have to be much smaller than those encountered in fixed wing practice if reasonable flow rates are to be realized. Because of the potential garbling problem in conventional ATCRBS with closely spaced aircraft, a system which integrates the ground and airborne equipments of a scanning beam microwave landing system with the airborne transponder while preserving interoperability was also developed and successfully tested. SYSTEM, AIRSPACE, AND CAPACITY REQUIREMENTS FOR FUTURE ATC-SYSTEMS
Ruediger Seifert and Guenther Och *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 15 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

Based on control capacity measurements of various air traffic control (ATC) systems, a theory of control capacity was developed. The theory of control capacity allows comprehensive knowledge to be gained concerning the relationship and interdependence of the following: (1) The airspace configuration (including the present separation requirements), the traffic structure and the resulting conflict probability. (2) The airspace capacity, the control capacity of the ATC control positions (functional units) and their dependence on air traffic structure and the technical ATC system features and capabilities. Using the theory of control capacity, systems of different technical structure were then assessed. Outdated, present day's, and future ATC systems are compared, showing the effect certain technical components and/or system functions have on system capacity. R.E.S.

MIDAIR CONFLICTS AND THEIR POTENTIAL AVOIDANCE BY PROGRESSIVE IMPLEMENTATION OF AUTOMATION
O. Weber *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 16 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

Actual midair conflicts between civil and military aircraft in German airspace where at least one of the airplanes involved was flying under visual flight rules were analyzed. Operational, environmental and human factors, which contributed to the accidents, and the limits of the 'see and avoid' concept for collision avoidance are discussed. Some shortcomings of the present air traffic control system are mentioned. Taking the actual midair conflicts and some simulated three dimensional flights as examples, the improvement of collision avoidance by progressive implementation of advanced techniques is discussed. The lead time to the potential conflict or to a circular zone of protection, the distance at the closest approach and some other thresholds, estimated by means of a ground-based radar system or an airborne electronic collision avoidance system, are used as main criteria for an automatic conflict alert. Potential advantages of a data link to detect sudden manoeuvres in time are mentioned. R.E.S.

DETERMINATION OF THE SAFETY IN A NORTH ATLANTIC ORGANIZED TRACK SYSTEM WITH REDUCED LATERAL SEPARATION
G. Moek and C. R. Traas *In* AGARD Air Traffic Management:

Civil/Mil. Systems and Technol. Feb. 1980 7 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

Collision risk modelling as related to the reduction of lateral separation from 120 NM to 60 NM at any fixed level in the North Atlantic Organized Track System is considered. Requirements on the navigation performance are described which aircraft must be able to meet if this reduction would be implemented. Two statistical tests are derived which can be applied to the measured number of navigation errors to determine whether the actual navigation performance is such that the system with 60 NM lateral separation meets a target level of safety. The first test which belongs to the standard equipment of the NAT/SPG for judging the safety of the track system is based on one random model for all navigation errors. The second test is applicable for the case different types of navigation errors can be distinguished and modelled separately. The different contribution of each type of error to the total risk is taken into account by the use of weighting factors. This test, however, is still in discussion in the North Atlantic Systems Planning Group. A.R.H.

US ARMY USERS OUTLOOK ON AIR TRAFFIC MANAGEMENT
William H. Maloney and Larry P. Kreps *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 5 p (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The need for air traffic control, not only in support of its fixed base peace-time mission, but also its tactical mission is recognized by the U.S. Army. Air traffic management as it existed during the Vietnam era of the 1960's and as it evolved during the 1970's is described. The European scenario literally dictates doctrine for hostile operations in a mid-intensity environment. What is happening and planned from an ATC viewpoint in support of U.S. Army/Europe (USAREUR) is discussed including the future potential of a global positioning system. A.R.H.

THE DEVELOPMENT AND TEST OF A TACTICAL SELF-CONTAINED LANDING SYSTEM
Norman K. Shupe *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 25 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The existence of a digital symbol generator (DSG) whose basic function is to compute and display the augmenting symbolic data necessary to operate a helicopter in the NOE environment via a FLIR presentation of the contact world, and a digitally-generated topographic map display (DMG) is sufficient justification to consider adaptation of the DSG and DMG equipments to the reversionary function of providing IMC terrain-following and tactical landing capabilities. The control/display architecture necessary to use a radar altimeter to control the elevation flight path of the aircraft and a Doppler radar to control the deceleration of the aircraft is presented. The assumed precision navigation system provides the Northing/Easting aircraft position: (1) to permit the aircraft to be steered along the prescribed ground track to the landing zone; (2) to provide a starting point for interrogation of the DMG terrain elevation data for purposes of generating anticipation for the TF system; and (3) to act in concert with the velocity output of the Doppler radar for purposes of following a preprogrammed deceleration profile to the landing zone. A multi-phase simulation and flight-test program to assess the performance of the complete system in the NOE environment are described. A.R.H.

VERY LIGHTWEIGHT AIR TRAFFIC MANAGEMENT SYSTEM USING AN ELECTRONIC SCAN ANTENNA
P. J. Woodall and J. L. Shagena, Jr. *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 12 p (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

An electronically scanned antenna with all solid-state interrogator, complemented by a multi-microprocessor driver tactical interactive display, provides a full alphanumeric PPI air traffic management system. This system utilizes the standard Mark X/XII ACTRBS/IFF airborne transponder to provide position information on all targets (up to 100) and tracked range, azimuth, and altitude (via mode C) on up to 13 targets. The two key features of this system are the electronically steered matrix-fed cylindrical array and the microprocessor based intelligent controller. The controller performs search and active track, minimizing interrogator PRF (64-198.5/Sec) and electromagnetic interference. The antenna and R/T are physically integrated into a single assembly to minimize set-up time and maximize reliability. A.R.H.

TECHNICAL AND OPERATIONAL FACTORS CONCERNING THE LICENSING AND INTRODUCTION OF A NEW MICROWAVE LANDING SYSTEM FOR CATEGORY 2
K. G. Brammer and K. D. Kricke *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 12 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

For the new aircraft Tornado and Alpha-Jet, the landing system SETAC is now being prepared for category 2 service at the assigned air bases in Germany. As soon as this system's technical capabilities are to be exploited to the full extent for operational use, all relevant rules and regulations applicable for ILS category 2 operations must be exhaustively expanded and supplemented. This concerns concepts for infrastructural measures, such as extension of obstacle clearance limits to the whole area of coverage, calibration and testing of the total radio field, modifications of the approach light pattern, additional training and licensing of ATC staff and pilots etc. In order to reduce this extensive task to a short-term solution, a stagewise procedure of system introduction is outlined. The concept is to utilize SETAC equipment with all the corresponding advantages regarding installation, but to retain in the first stage as closely as possible all regulations, flight procedures and instrumentation pertaining to ILS approach and landing. A.R.H.

THE INTEGRATION OF AREA NAVIGATION AND THE MICROWAVE LANDING SYSTEM
Donald W. Richardson and Paula M. Rich (FAA, Washington, D.C.) *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 17 p Sponsored by FAA (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The RNAV and MILS are non-competitive complementary navigation/landing systems that, working together, can markedly enhance the safety and efficiency of terminal area operation while at the same time impacting the overall concept of terminal airspace management. Primarily, these systems afford the opportunity, which has been debated so vigorously for many years, of converting to a distributed management philosophy of ATC system design and operation in which much of the navigation function is transferred from the radar vectors issued by the ground controller to the flight crew, aided by increasingly available, low cost, multifunction avionics systems. Some activities on the part of the United States Federal Aviation Administration to develop and integrate these complementary capabilities into the terminal area airspace system are examined. A.R.H.

SINTAC-C TMA: APPLICATION OF SINTAC-C IN THE TERMINAL AREA, DURING LANDING AND GROUND TAXIING
Lj. Milosevic and J. Hetyei *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 20 p (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

An integrated navigation, traffic control, collision avoidance and communication system is described which can control between 200 and 1000 aircraft according to the number of runways (or airports) included in terminal area. During final approach and landing, the system controls 16 aircraft, the maximum which can be considered in the MLS beam, with a

30 second landing rate. According to the required control capacity, the system uses one, two or three time-shared nets for all the functions and for all the in flight and ground phases. The navigation transmission rates are very high (32-16 Hz) thus ensuring a practically continuous navigation function. The surveillance and synchronization frequency depend on the area: a maximum of 4 seconds in the terminal area and a 1 second maximum at landing time. Three types of SINTAC ground stations are considered: (1) SINTAC-TMA: 100-150 km range covering the TMA area with three or four stations; (2) SINTAC-landing: located at the far-end of the runway (precision DME), range and antenna beam aperture same as MLS; and (3) SINTAC-ground taxiing: airport area coverage by three stations: station range: 5 to 10 km. A.R.H.

APPLICATIONS OF MICROPROCESSORS IN AIR TRAFFIC c64
David L. Stoddart *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 10 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The use of microprocessors in air traffic control (ATC) systems is examined. The characteristics of microprocessors are compared with those of mini and main frame computers to identify the most suitable role of the microprocessor in ATC Systems. The application of microprocessors for system functions such as Data Link Management, Display Console Management and Format Converters is discussed. To emphasize the impact of microprocessors on system design a conventional display system is compared with one using microprocessors where this device is built into the overall design of the display system with consequent saving in display generation hardware. The design is extended so that the display microprocessor becomes the central element in display console management. The F100L microprocessor is described in some detail and used as model to define the capability of a microprocessor. M.G.

PRECISION NAVIGATION FOR AIR TRAFFIC MANAGEMENT
S. Ratcliffe *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 5 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The problems that would arise if airspace users had the use of NAVSTAR or some other much better position-fixing aid than at present, and the uses that air traffic control (ATC) could or could not make of this capability are examined. There would be formidable transitional problems in the vertical plane, because NAVSTAR measures height from the Earth's center whereas current altimeters measure atmosphere pressure. In either vertical or horizontal planes much work would be necessary to prove that the separation standards can be reduced at all. The changes that might be possible in the ATC system should appreciable reductions in separation standards prove possible are discussed. NAVSTAR might form the basis of a collision avoidance system based on either the broadcast coordinates of each aircraft or on a time frequency basis using NAVSTAR as the time reference. The latter scheme would offer protection of a fully equipped aircraft against threat that could not afford the expense of a NAVSTAR fit. M.G.

JTIDS: AN INTEGRATED COMMUNICATIONS NAVIGATION AND IDENTIFICATION SYSTEM, AND ITS POTENTIAL FOR AIR TRAFFIC MANAGEMENT
Donald D. Neuman *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 13 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The integrated data communications, voice communications, navigation, and identification features of the Joint Tactical Information Distribution System (JTIDS) are described with emphasis on those features applicable to air traffic management. The JTIDS system architecture simultaneously provides data at the ground centers and in the cockpit. Airspace control and advisory data are made available to all aircraft to permit subscribers to be aware of, and comment upon, directions provided to others. Network control techniques are discussed which support civil air traffic management applications. These techniques provide for the apportionment of capacity among subscribers in such a manner as to allow all subscribers access to all data in their area of interest without real time network management. The potential exists for a substantial reduction in the avionics boxes aboard aircraft. A JTIDS like system can simultaneously provide the data for airspace management and control, collision avoidance, area navigation, air-to-air coordination, cooperative surveillance, cockpit situation display, airport surface traffic control, and possibly instrument landing. The transition from the existing air traffic management system to a JTIDS like system is also addressed. Austere terminal designs appear to be possible at a cost that is affordable for general aviation. M.G.

DISCRETE ADDRESS BEACON SYSTEM
P. D. Hogkins *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 10 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

A discrete address beacon system (DABS) to provide upgraded air traffic control radar beacon system (ATCRBS) surveillance is discussed. The DABS concept provide improved air traffic control automation service and ground based automatic traffic advisory and resolution service through its integral high capacity digital air ground data link. The compatibility of DABS with ATCRBS, interrogation concepts, and the computer processing subsystem are specifically discussed and current testing and evaluations of the system are reviewed. M.G.

N80-27345# Royal Signals and Radar Establishment, Malvern (England).
ADSEL: SELECTIVE ADDRESS SSR, PERFORMANCE OF THE EVALUATION STATION
R. C. Bowes, T. B. Nichols, and J. M. Bonny *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 8 p refs (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

A selectively addressed radar system (ADSEL) designed to overcome the 'garble' problem of the current secondary surveillance radar (SSR) system and provide a data link facility is

discussed. The system requires aircraft to carry a transponder which includes the selective address mode of operation and a ground station with monopulse direction finding system plus data processing facilities. In particular the evaluation trials that have been carried out are reviewed and the results of a large number of aircraft flights are given. The main aim of the trials is to assess the accuracy with which the position of an aircraft can be measured, the performance of the communication links, and to optimise the operating rules. A detailed analysis is given of the performance of the SSR and ADSEL system when monitoring two aircraft flying close together such that their transponder replies were 'garbling'. M.G.

N80-27346# Lincoln Lab., Mass. Inst. of Tech., Lexington.
SURVEILLANCE PERFORMANCE MEASUREMENTS OF THE SSR MODE OF THE DISCRETE ADDRESS BEACON SYSTEM
Vincent A. Orlando and Paul R. Drouilhet. *In* AGARD Air Traffic Management: Civil/Mil. Systems and Technol. Feb. 1980 11 p refs Sponsored by FAA (For primary document see N80-27324 18-04)
Avail: NTIS HC A13/MF A01

The field measurements, taken to evaluate the surveillance performance of the Discrete Address Beacon System (DABS), are described. Simultaneous measurements made by transportable measurements facilities and the existing ground stations provided the opportunity for a side-by-side comparison of DABS off-boresite monopulse and conventional surveillance measurement performance. The results indicate that both range and azimuth accuracies of the DABS design are four times better than those provided by current terminal secondary surveillance radar (SSR) equipment. Blip/scan ratio for monopulse SSR is 98% or better, and remains high in crossing track situations where the performance of existing equipment is observed to degrade. Significantly, this improvement in SSR performance was accomplished with 1/4 the pulse repetition frequency of the present equipments. M.G.

EFFECT OF SOME STRUCTURAL PARAMETERS ON ELASTIC ROTOR LOADS BY AN ITERATIVE HARMONIC BALANCE Ph.D. Thesis
Abraham Eipe 1979 122 p
Avail: Univ. Microfilms Order No. 8012195

The coupled flap-lag equations of motion for an elastic helicopter blade in forward flight are derived including several structural coupling parameters. These nonlinear equations of motion are solved by an iterative harmonic balance method. Depending on the nature of the rotor load trim, the equations for the steady thrust and roll and pitch moments are also solved simultaneously with the flap equation of motion to obtain the unknown control settings. Once the generalized coordinates and the control settings are known the rotor load harmonics are computed by Fourier analysis. Effects of various structural coupling parameters on rotor loads are studied for three typical rotors: a stiff in-plane hingeless tail rotor, a soft in-plane hingeless main rotor, and an articulated main rotor. The results show excellent convergence of the iterative solution scheme. Dissert. Abstr.

MULTILEVEL OPTIMUM DESIGN OF WING BOX STRUCTURES WITH FIBER COMPOSITE PANEL COMPONENTS Ph.D. Thesis
Massood Mehrinfar 1980 180 p
Avail: Univ. Microfilms Order No. 8016018

A multilevel approach is used which considers the overall sizing of the structure using equivalent thickness type design variables as a system level task while detailed design is carried out at the component level for each individual panel. The total structural weight is taken as the system level objective function while the change in equivalent system stiffness is taken to be the objective function for each of the uncoupled component level problems. The key idea is to select the component level objective function so as to minimize change in component loads due to subsequent force redistribution, accomplished by taking the change in stiffness as the component level objective function to be minimized. Finite element analysis is used at the system level to compute the internal forces. Each fiber composite panel is modelled by stacking layers of orthotropic assumed stress rectangular elements representing equivalent thicknesses. Approximation concepts such as linking, constraint deletion, and explicit approximations of retained constraints are employed. A quadratic extended interior penalty function formulation is used as the optimization tool at both the system and component design modification levels. Dissert. Abstr.

THE F-4 SERVICE LIFE TRACKING PROGRAM CRACK GROWTH GAGES Final Report, Feb. 1978 - Sep. 1979

C. R. Saff Wright-Patterson AFB, Ohio AFFDL Dec. 1979 138 p refs

(Contract F42600-78-D-0014; AF Proj. 2401)

(AD-A083978; AFFDL-TR-79-3148) Avail: NTIS HC A07/MF A01 CSCL 01/3

The objective of this program was to evaluate the ability of a crack growth gage to monitor potential crack growth damage in fatigue critical locations of F-4C/D aircraft structure. Crack growth gages were designed for use on the lower wing skin of F-4 aircraft. An element test program was performed to verify gage design and provide data for predicting gage behavior when attached to the fatigue test article. Results of those tests prompted performance of a supplemental test program to investigate effects of sheet thickness on crack growth retardation. Results from both of these test programs were used to develop procedures to predict crack growth in gages attached to the fatigue test article. Eight gages were bonded to the test article using room temperature cure adhesive after an elevated cure temperature adhesive failed. Results show gage crack growth is predictable. Analysis results demonstrate the monitoring potential of the gage. GRA

STUDY OF COST/BENEFIT TRADEOFFS AVAILABLE IN HELICOPTER NOISE TECHNOLOGY APPLICATIONS Final Report

R. H. Spencer and H. Sternfeld, Jr. Jan. 1980 34 p refs

(Contract DOT-FA78WA-4161)

(AD-A083955; FAA/EE-80-5) Avail: NTIS HC A03/MF A01 CSCL 01/3

This study investigated cost/benefit tradeoffs using the case histories of four helicopters for which design and development were complete, and in three cases, have undergone substantial flight testing. The approach to quieting each helicopter was an incremental reduction of each source as required to obtain reductions in flyover noise with modifications to other secondary systems only as necessary. The methodology used to predict the effects of the design modifications on acquisition, maintenance, and operating costs were typical of those employed by rotorcraft manufacturers. The reduction of helicopter flyover noise generally was achieved through reductions in rotor tip speed. Performance characteristics were maintained to specified minimums for each aircraft in the study. GRA

N80-27355# Federal Aviation Administration, Washington, D. C. Office of Environment and Energy.

ENERGY CONSERVATION POTENTIAL OF GENERAL AVIATION ACTIVITY

Sep. 1979 52 p refs

(AD-A081182; FAA/EE-79-20) Avail: NTIS HC A04/MF A01 CSCL 01/2

Three approaches for reducing energy consumption were investigated: hardware modification, pilot education, and air traffic control. It is recommended that research into new aircraft engine designs, automatic mixture controls, conventional engine fuel saving improvements, composite materials development, and aerodynamic drag reduction continue and that this hardware be introduced into the fleet when cost, reliability and safety considerations allow. It is further recommended that the pilot awareness and education programs listed above be implemented by the FAA and the general aviation industry, and finally, that the ATC actions listed should be further evaluated to determine whether the anticipated fuel savings justify their implementation. GRA

COSTS AND BENEFITS OF REQUIRING NEW PRODUCTION OF OLDER AIRCRAFT TYPES TO MEET AMENDED NOISE STANDARDS Final Report

C. F. Day and E. D. Studholme Sep. 1979 76 p refs

(Contract DOT-FA78WA-4192)

(AD-A080130; FAA/EE-79-22) Avail: NTIS HC A05/MF A01 CSCL 01/3

This report examines costs and benefits associated with requiring new production of older aircraft models to meet amended noise standards. Two cases are examined: (1) all aircraft produced after 1983 must meet a noise emission standard halfway between Stage 2 and Stage 3 limits; and (2) all aircraft produced after 1985 must meet Stage 3 noise standards. The cost elements are combined and expressed as a change in direct operating costs in either cost-per-passenger mile or cost-per-aircraft mile, as appropriate. Noise benefits are estimated in terms of the change in area under a 100 EPNL contour resulting from the amended standards. GRA

N80-27357# Bolt, Beranek, and Newman, Inc., Canoga Park, Calif.

COST/BENEFIT TRADEOFFS AVAILABLE IN AIRCRAFT NOISE TECHNOLOGY APPLICATIONS IN THE 1980'S Final Report

John F. Wilby and William J. Galloway Dec. 1979 175 p refs

(Contract DOT-FA77WA-4037)

(AD-A082028; BBN-3856; FAA/EE-80-2) Avail: NTIS HC A08/MF A01 CSCL 01/3

The current status of aircraft noise control technology is reviewed to identify those measures that have a reasonable potential for application to aircraft coming into service in the 1980's. Noise reduction achievable when these noise control measures are applied to two transport category airplanes, a business jet, and a small propeller-driven twin is determined. Costs and performance penalties are determined for each noise control option. Benefits are measured by reductions in FAR 36 certification noise levels and in reductions in EPNL contour areas. The study shows that current, late 1970's, noise control practices permit transport category airplanes to meet the FAR 36 Stage 3 noise limits, yet application of additional noise control measures is not likely to provide additional reduction of the noise levels for these aircraft by more than 3 decibels. New business jet noise levels will be as much as 10 decibels lower than Stage 3 limits for takeoff, and as much as 5 decibels lower on approach, with additional reductions of more than 3 decibels unlikely. Introduction of newly designed, geared reciprocating engines would provide reductions of 10 or more decibels for high performance single and twin-engined, propeller-driven small airplanes, relative to existing practice. GRA

FLIGHT INVESTIGATION OF COCKPIT-DISPLAYED TRAFFIC INFORMATION UTILIZING CODED SYMBOLOGY IN AN ADVANCED OPERATIONAL ENVIRONMENT
Terence S. Abbott, Gene C. Moen, Lee H. Person, Jr., Gerald L. Keyser, Jr., Kenneth R. Yenni, and John F. Garren, Jr. Jul. 1980. 31 p. refs.
(DA Proj. 1L2-62209-AH-76)
(NASA-TP-1684; AVRADCOM-TR-80-B-4; L-13584) Avail: NTIS HC A03/MF A01 CSCL 01D

Traffic symbology was encoded to provide additional information concerning the traffic, which was displayed on the pilot's electronic horizontal situation indicators (EHSI). A research airplane representing an advanced operational environment was used to assess the benefit of coded traffic symbology in a realistic work-load environment. Traffic scenarios, involving both conflict-free and conflict situations, were employed. Subjective pilot commentary was obtained through the use of a questionnaire and extensive pilot debriefings. These results grouped conveniently under two categories: display factors and task performance. A major item under the display factor category was the problem of display clutter. The primary contributors to clutter were the use of large map-scale factors, the use of traffic data blocks, and the presentation of more than a few airplanes. In terms of task performance, the cockpit-displayed traffic information was found to provide excellent overall situation awareness. Additionally, mile separation prescribed during these tests. L.F.M.

07 AIRCRAFT PROPULSION AND POWER

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power*, *28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

PERFORMANCE, EMISSIONS, AND PHYSICAL CHARACTERISTICS OF A ROTATING COMBUSTION AIRCRAFT ENGINE, SUPPLEMENT A
R. K. Lamping, I. Manning, D. Myers, and B. Tjoe. May 1980. 74 p.
(Contract NAS3-20808)
(NASA-CR-135119; CW-WR-76-028.3) Avail: NTIS
HC A04/MF A01 CSCL 21E

Testing was conducted using the basic RC2-75 engine, to which several modifications were incorporated which were designed to reduce the hydrocarbon emissions and reduce the specific fuel consumption. The modifications included close-in surface gap spark plugs, increased compression ratio rotors, and provisions for utilizing either side or peripheral intake ports, or a combination of the two if required. The proposed EPA emissions requirements were met using the normal peripheral porting. The specific fuel economy demonstrated for the modified RC2-75 was 283 g/kW-hr at 75% power and 101 brake mean effective pressure (BMEP) and 272.5 g/kW-hr at 75% power and 111 BMEP. The latter would result from rating the engine for takeoff at 285 hp and 5500 rpm, instead of 6000 rpm. E.D.K.

COMPOSITE WALL CONCEPT FOR HIGH TEMPERATURE TURBINE SHROUDS: HEAT TRANSFER ANALYSIS
Francis S. Stepka and Lawrence P. Ludwig. 1980. 17 p. refs. Presented at Aerospace Congr., Los Angeles, 13-16 Oct. 1980; sponsored by Soc. of Automotive Engr.
(NASA-TM-81539; E-402) Avail: NTIS HC A02/MF A01 CSCL 21E

A heat transfer analysis was made of a composite wall shroud consisting of a ceramic thermal barrier layer bonded to a porous metal layer which, in turn, is bonded to a metal base. The porous metal layer serves to mitigate the strain differences between the ceramic and the metal base. Various combinations of ceramic and porous metal layer thicknesses and of porous metal densities and thermal conductivities were investigated to determine the layer thicknesses required to maintain a limiting temperature in the porous metal layer. Analysis showed that the composite wall offered significant air cooling flow reductions compared to an all impingement air cooled, all metal shroud. Author

NUMERICAL CALCULATION OF TRANSONIC AXIAL TURBOMACHINERY FLOWS
Djordje S. Dulikravich. 1980. 10 p. refs. Presented at 7th Intern. Conf. on Numerical Methods in Fluid Dyn., Stanford, Calif., 23-27 Jun. 1980; sponsored by NASA, AFOSR, NSF, and ONR
(NASA-TM-81544; E-500) Avail: NTIS HC A02/MF A01 CSCL 21E

A numerical method and the results of a computer program are presented for solving an exact, three dimensional, full potential equation that models rotating and nonrotating inviscid, absolutely irrotational, homentropic flows. Besides calculating the flows through an arbitrarily shaped rotor or stator blade row mounted on an axisymmetric hub and confined in an axisymmetric duct, the computer program is also capable of analyzing flow fields about arbitrarily shaped wing body combinations, propellers, helicopter rotors in hover, and wind turbine rotors. The governing equation is solved numerically in a fully conservative form by using an artificial time concept, a finite volume technique, rotated type dependent differencing, successive line overrelaxation, and sequential boundary conforming grid refinement. An artificial viscosity is added in fully conservative form, and an initial guess for the potential field is applied, as determined by a two dimensional cascade analysis. Author

CF6-6D ENGINE PERFORMANCE DETERIORATION
Ray H. Wulf, W. H. Kramer, J. E. Pass, and J. J. Smith. Jan. 1980. 286 p. refs.
(Contract NAS3-20631)
(NASA-CR-159786; R80AEG216) Avail: NTIS
HC A13/MF A01 CSCL 21E

Cruise cockpit recordings and test cell performance data in conjunction with hardware inspection data from airline overhaul shops were analyzed to define the extent and magnitude of performance deterioration of the General Electric CF6-6D model engine. These studies successfully isolated short-term deterioration from the longer term, and defined areas where a significant reduction in aircraft energy requirements for the 1980's can be realized. Unrestored losses which remain after engine refurbishment represent over 70% of the loss at engine shop visit. Sixty-three percent of the unrestored losses are cost-effective to restore which could reduce fuel consumed by CF6-6D engines in 1980 by 10.9 million gallons. Author

LOSS MODEL FOR OFF-DESIGN PERFORMANCE ANALYSIS OF RADIAL TURBINES WITH PIVOTING-VANE, VARIABLE-AREA STATORS
Peter L. Meitner and Arthur J. Glassman 1980 22 p refs
Proposed for presentation at the Aerospace Congr., Los Angeles, 13-16 Oct. 1970; sponsored by the Society of Automotive Engineers Prepared in cooperation with Army Aviation Research and Development Command, Cleveland
(NASA-TM-81532; AVRADCOM-TR-80-C-18; E-455) Avail: NTIS HC A02/MF A01 CSCL 21E

An off-design performance loss model is developed for variable-area (pivoted vane) radial turbines. The variation in stator loss with stator area is determined by a viscous loss model while the variation in rotor loss due to stator area variation (for no stator end-clearance gap) is determined through analytical matching of experimental data. An incidence loss model is also based on matching of the experimental data. A stator vane end-clearance leakage model is developed and sample calculations are made to show the predicted effects of stator vane end-clearance leakage on performance. Author

INFLUENCE OF NOISE REDUCTION ON WEIGHT AND COST OF GENERAL AVIATION PROPELLERS Final Report
Robert J. Klatte and Frederick B. Metzger Jun. 1979 111 p refs
(Contract DOT-FA78WA-4111)
(AD-A082120; FAA-AEE-79-18) Avail: NTIS
HC A06/MF A01 CSCL 01/3

Results of a study are reported in which the influence of noise reduction on weight and cost of propellers used in General Aviation aircraft was evaluated. Aircraft performance was not to be degraded by installation of the reduced noise propellers. Only propeller modifications were permitted. Engine modifications, such as introduction of a gearbox to reduce noise by reduction of RPM, were not permitted in the study. Major factors in noise reduction found promising in the study were (1) optimization of performance by use of the best available airfoils, (2) use of thin airfoils and a narrow elliptical tip blade planform, and (3) increasing the number of blades consistent with maintaining aircraft performance. For the three aircraft studied (a single engine, a light twin and a heavy twin) the flyover noise reduction potential varied from 3 to 8 dBA with no weight or cost penalty. Greater reductions in noise resulted in increased weight and/or cost penalties. Also, in some cases, engine noise would have to be reduced to achieve greater reductions. The progress by General Aviation aircraft manufacturers in reducing noise is indicated by the finding that the most recent aircraft design had the smallest noise reduction potential. GRA

(AD-A083987; ARL/PSU-TM-80-10) Avail: NTIS
HC A03/MF A01 CSCL 21/5

The response of an axial flow turbomachine to spatial velocity variations can be determined by the unsteady pressure distribution function which has been developed and represents an extension of an earlier analysis of the unsteady lift. A computer program has been written to formulate the unsteady pressure difference as a function of design parameters. This program is versatile in that it includes the effects of the cascade geometrical parameters and disturbance flow characterisitics, such as the blade camber, angle of incidence, nonconvected disturbance, and it also gives the unsteady lift and moment. The documentation and the use of this program are presented herein. GRA

HC A04/MF A01 CSCL 21/5

Results of an investigation in which turbomachinery rotor sound spectra were correlated with aerodynamic measurements of the inlet turbulence, strut wake, and vortex flow strengths are reported. Aerodynamic measurements includeo mean velocity profiles, turbulence intensity, and axial length scales. Inlet turbulence data indicate that the major effect of flow contraction appears to be the elongation of turbulent eddies from 20 cm to 200 cm. Eddies of this size dominate the blade passing frequency (BPF) tones. Decreasing eddy size by use of a grid revelaed vortex flow strength to be the second major sound source. A doubling of vortex flow strength produced a 6 dB increase in the SPL of the first BPF. The sound pressure level showed less than a 2 dB change with doubling of wake turbulence intensity or velocity defect. A discussion of the relative importance of various sources of noise due to flow distribution at the inlet is given. This report will be submitted to the Journal of Sound and Vibration for publication. GRA

MODELING THE COMBUSTION CHAMBER OF A GAS TURBINE: A MECHANICS VIEWPOINT [MODELISATION DES FOYERS DE TURBOREACTEURS: POINT DE VUE D'UN MOTORISTE]
Ph. Gastebois *In* AGARD Combustor Modelling Feb. 1980 7 p refs In FRENCH (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

Two objectives must be met when modeling combustion chambers for gas turbines. The optimization of combustion chambers presently directed towards the reduction of pollutant emissions, but which can be directed towards performance, stability, and relighting, must take into consideration the characteristics of the injection system, the primary zone, and the dilution. In addition, the prediction of combustion chamber performances should also permit the prediction of the characteristics of the outlet temperature, the wall temperature, and of the polluting emissions. To fill these two objectives, the mechanical engineer wants two types of models: a simplified one for performance estimation, and a more thorough model for optimizing the architecture of the combustion chamber. In both cases, a better knowledge of the physical phenomena (radiation, transfer, and reaction kinetics) obtained from improved measurements is indispensable. Transl. by A.R.H.

FUNDAMENTAL MODELLING OF MIXING, EVAPORATION AND KINETICS IN GAS TURBINE COMBUSTORS

J. Swithenbank, A. Turan (Science Applications, Inc., Woodland Hills, Calif.), P. G. Felton, and D. B. Spalding (Imperial Coll. of Science and Technology) *In* AGARD Combustor Modelling Feb. 1980 21 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

Past achievements current status and future prospects of combustor modeling are discussed. The past achievements largely consist of detailed studies of idealized flames which have given an understanding of the relevant fundamental processes. However, gas turbine combustor computations must include the simultaneous interacting processes of three dimensional two-phase turbulent flow, evaporating droplets, mixing, radiation and chemical kinetics. At the present time numerical prediction algorithms are becoming available which can model all these processes to compute the hydrodynamic, thermodynamic and chemical quantities throughout a three dimensional field. Complementary stirred reactor network algorithms permit the prediction of minor consistuents (pollutants), again including such effects as droplet evaporation and unmixedness. Experimental verification of these various predictions reveals remarkably good agreement between measured and predicted values of all parameters in spite of the physical and mathematical assumptions currently used. Future problems include: more accurate modeling of turbulence/kinetic interactions, numerical procedure optimization and detailed measurements of residence time distribution and two-phase parameters in real, hot combustors. R.E.S.

MATHEMATICAL MODELLING OF GAS-TURBINE COMBUSTION CHAMBERS

W. P. Jones and J. J. McGuirk *In* AGARD Combustor Modelling Feb. 1980 11 p refs Sponsored by Rolls-Royce Ltd. (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

A mathematical model for predicting the performance of gas turbine combustion chambers is described. The model is based on the finite difference solution of the averaged forms of the governing partial differential conservation equations and turbulent transport is approximated via a variable density form of the k-epsilon turbulence model. The reactions associated with heat release are assumed sufficiently fast for chemical equilibrium to prevail on an instantaneous basis; and the influence of local turbulent fluctuations in mixture strength accounted for by a beta-probability density function. Liquid fuel sprays are represented by a transport equation for the probability density function describing the variation of droplet mass fraction with droplet radius. Computations of 2-d axisymmetric and 3-d flows are compared with experimental results and an assessment made of the adequacy of the various submodels embodied in the prediction procedure. Author

A PREDICTION MODEL FOR TURBULENT DIFFUSION FLAMES INCLUDING NO-FORMATION

J. Janicka (RWTH, Aachen, West Germany) and W. Kollmann *In* AGARD Combustor Modelling Feb. 1980 17 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

A prediction model for turbulent diffusion flames burning gaseous fuels was developed and applied to H2-air flames. In the (simplified) system of chemical reactions the fast reactions are assumed in equilibrium, equilibrium whereas three-body recombinations are treated in non-equilibrium. For the H2-air flames this assumption leads to a description of the reacting system with only two variables f and r. Two methods of treating such a system in a turbulent flow are discussed: (1) modeling and solving transport equations for first and second order moments of these variables and prescribing the form of the pdf of f and r as a function of the selected moments, or (2) modeling and solving the equation for the pdf of f and r. Both sets of equations are complemented with a modified version of the k-epsilon turbulence model. The NO-formation in such flames can be calculated using the non-equilibrium values (mean values and covariances) of the O and H radicals. The results obtained with both models are compared with experiment and show good agreement. R.E.S.

TURBULENT REACTION AND TRANSPORT PHENOMENA IN JET FLAMES

H. Eickhoff, K. Grethe (Karlsruhe Univ.), and F. Thiele (Technische Univ., Berlin, West Germany) *In* AGARD Combustion Modelling Feb. 1980 11 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

A new reaction model accounting for intermediate species was applied in connection with the k-epsilon model to predict different free and enclosed turbulent natural gas flames. The reaction model is based on the assumption of a quasilaminar flame substructure of a turbulent diffusion flame and a probability density distribution of fuel-atom-concentration. It is assumed, that the quasilaminar flames are in local chemical equilibrium within zones of finite thickness. The influence of variable density on the mixing process was studied for different jets and jet flames. In the parabolic flow cases it was found necessary to account for variable density which was done by a mixing length relation. Different numerical procedures were applied for the parabolic and elliptic flow fields. Author

ON THE PREDICTION OF TEMPERATURE PROFILES AT THE EXIT OF ANNULAR COMBUSTORS

Osama M. F. Elbahar and Sigmar L. K. Wittig *In* AGARD Combustor Modelling Feb. 1980 9 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

Despite their inherent limitations, two dimensional prediction procedures based on solving the basic equations and incorporating the k-epsilon model of turbulence are shown to be effective tools in designing annular combustors. In comparing the results it was found that predictions from available jet mixing correlation data within certain limitations represent measurements from single row injection more accurately. Detailed calculations, however, are more effective in predicting opposite wall cooling air injection, multiple row jet mixing, heat transfer, film cooling and the effects of converging combustor exit. R.E.S.

SECOND-ORDER CLOSURE MODELING OF TURBULENT MIXING AND REACTING FLOWS

Ashok K. Varma, Guido Sandri, and Coleman duP. Donaldson *In* AGARD Combustor Modelling Feb. 1980 13 p refs (For primary document see N80-27371 18-07)

(Contracts N00014-75-C-1143; N00014-79-C-0335; F44620-76-C-0048; Proj. SQUID)

Avail: NTIS HC A17/MF A01

Models for the scalar probability density function (PDF) have to be developed to achieve closure of turbulent transport equations for mixing and reacting flows. A delta function typical eddy model was developed for the joint PDF of the scalar variables. It was demonstrated that delta functions are a necessary part of PFTs in order to attain the extremums of the statistical constraints on the moments. The statistical bounds on a number of moments of interest for two and three species flows were derived. It was proven that a rational PDF composed of a set of delta functions alone can always be constructed at any point within the statistically valid moment space. The model provides a good representation of actual PDFs in two species, variable density, mixing flows. The model was directly compared to experimental PDF measurements and good agreement for higher order moments was demonstrated. It can be shown that the delta function PDF model is significantly simpler than other proposed PDF models and is more than adequate for the closure of the transport equations. E.D.K.

COMBUSTOR MODELLING FOR SCRAMJET ENGINES

J. Philip Drummond, R. Clayton Rogers, and John S. Evans *In* AGARD Combustor Modelling Feb. 1980 30 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

A system of computer programs being developed to model complex combustor flow fields is discussed. Each code solves a system of equations compatible with the type of flow being analyzed in any particular part of the combustor. For flows that remain supersonic throughout, a parabolic Navier-Stokes solver is used successfully. An extension of this computer program, to partially introduce elliptic character into the analysis by accounting for a full three dimensional pressure field, is being tested. This partially elliptic scheme accounts for the effects of streamwise pressure feedback present in the subsonic flow, thereby allowing the detection and calculation of embedded subsonic regions known to be present in the combustor. Although the partially elliptic procedure can handle mixed subsonic-supersonic flows, it still requires that a predominant flow direction exists; for recirculating flows, the fully elliptic Navier-Stokes equations are required. Since recirculating flow does exist in regions near points of fuel injection from struts in the engine, work is currently underway to begin development of a three dimensional elliptic Navier-Stokes solver. Initial work includes development of a two dimensional elliptic code for the analysis of slot fuel injectors. E.D.K.

DEVELOPMENT AND VERIFICATION OF RADIATION MODELS

H. Bartelds (Organization for Applied Scientific Research, TNO, Apeldoorn, Netherlands) *In* AGARD Combustor Modelling Feb. 1980 20 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

The prediction of radiative heat transfer from a flame may be divided into three categories: (1) the evaluation of temperature distribution and radiating species concentrations; (2) the evaluation of the absorption, emission, and scattering characteristics of the species at the prevailing temperatures; and (3) the evaluation of the radiation exchange. All three categories are discussed with respect to experiments and mathematical models. Emphasis is placed on models falling into categories two and three. The models were verified by comparison with measured radiation intensities and measured radiative heat fluxes from relatively large gas flames. Measured temperatures and species concentrations were used as input to the models. However, the models are well suited to be combined with each other and with prediction procedures for fluid flow and combustion. E.D.K.

ASSESSMENT OF AN APPROACH TO THE CALCULATION OF THE FLOW PROPERTIES OF SPRAY-FLAMES

Y. El Banhawy and J. H. Whitelaw *In* AGARD Combustor Modelling Feb. 1980 11 p refs Sponsored by the Minister of Defence (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

A method for the calculation of the local properties of spray flames is described and its capabilities and limitations appraised by comparing calculated results with measurements. The method solves elliptic differential equations representing the conservation of mass, momentum, enthalpy, and species concentrations in finite difference form. In addition, Lagrangian equations for the droplet motion and thermal balance are solved for the finite ranges of droplet size. A two equation turbulence model, a combustion model based on mean mass fraction equations for fuel and oxidant, and a four flux radiation model are used. The droplet model assumes that the evaporating droplets act as distributed point sources of fuel vapor. The merits of the method are quantified by comparison with measurements obtained for three different spray flame geometries. The assumption of representing the spray by a finite number of size ranges was also examined and the results indicate that the importance of this number is related to the spray type and the aerodynamic features of the flow close to the spray. E.D.K.

FUNDAMENTAL CHARACTERIZATION OF ALTERNATIVE FUEL EFFECTS IN CONTINUOUS COMBUSTION SYSTEMS

R. B. Edelman, A. Turan, P. T. Harsha, E. Wong, and W. S. Blazowski (Exxon Research and Engineering Co., Linden, N.J.) *In* AGARD Combustor Modelling Feb. 1980 14 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

The problem of net soot generation which is aggravated by the reduced hydrogen content characteristic of syncrudes that have been identified as probable alternate fuel sources for use in gas turbines is addressed. The kinetics of the process are modeled using the quasi-global concept while experimental data are developed primarily from a laboratory jet stirred combustor. Results are presented showing that soot emissions can be characterized in terms of major species and that soot oxidation must be included in the prediction of net soot generation. In addition, the techniques being employed for coupling the chemical and aerodynamic processes are outlined. E.D.K.

CHEMICAL KINETIC MODELLING FOR COMBUSTION APPLICATION

F. L. Dryer and C. K. Westbrook (California Univ., Livermore, Lawrence Livermore Lab.) *In* AGARD Combustor Modelling Feb. 1980 17 p refs (For primary document see N80-27371 18-07)

(Contracts W-7405-eng-48; EC-77-S-02-4272)

Avail: NTIS HC A17/MF A01

A systematic study of kinetic oxidation models for practical fuels is described. The construction of detailed reaction mechanisms for the oxidation of typical hydrocarbon fuels and the validation of these mechanisms through careful comparisons between computer and experimental data are discussed. These mechanisms are strongly hierarchical with reactions for complex fuels containing subsets which describe the combustion of chemically simpler fuels. Progress to date includes relatively complete descriptions of carbon monoxide, hydrogen, methane, and methanol oxidation. In the development and verification of these reaction mechanisms, data from a variety of experimental sources including slow reactor techniques at intermediate temperatures and shock tube results at high temperatures were used. In addition, ranges in fuel-air equivalence ratio between very lean through stoichiometric to very rich were also considered. E.D.K.

COALESCENCE/DISPERSION MODELLING OF GAS TURBINE COMBUSTORS

David T. Pratt *In* AGARD Combustor Modelling Feb. 1980 13 p refs Presented at the Proj. SQUID Workshop on Gas Turbine Combust., Princeton, N.J., 31 May - 1 Jun. 1978 Sponsored in part by Utah Univ. and AVCO-Lycoming Corp. (For primary document see N80-27371 18-07)

(Grant NSF ENG-76-84533)

Avail: NTIS HC A17/MF A01

Finite rate micromixing may be introduced into both the perfectly stirred reactor (PSR) and plug flow reactor (PFR) models due to recent advances in computation of stochastic or Monte Carlo methods together with improved algorithms for calculating equilibrium and nonequilibrium chemistry. In the PSR this improvement allows assessment of the effects of primary zone inhomogeneities due to fuel-air ratio, temperature, and age or degree of reactedness within fluid elements. In the PFR regions finite rate mixing of secondary air admission into the post primary stream may be described, leading eventually to prediction of mixing inhomogeneities on pattern factors. E.D.K.

COMBUSTION ZONE MODELING IN UNSTEADY REGIME

Francis Hirsinger and Helene Tichtinsky *In* AGARD Combustor Modelling Feb. 1980 12 p refs In FRENCH; ENGLISH summary (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

A modeling of the flows was undertaken reveal characteristic behaviors rather than to represent the whole set of phenomena taking place in actual, geometrically complicated combustion zones. The modeling technique consists of writing the equations of unsteady aerothermochemical budgets, taking into account the gas dynamics of the laminar or turbulent diffusion and the chemical kinetics for a series of cells representing the domain under study. These budget equations are treated in an integral manner in space and a differential manner in time. This method makes it possible to exactly follow the actual unsteady phenomena or to have a faster access to steady regimes through virtual unsteady evolutions. The applications presented correspond to a two dimensional flow in a duct partially choked by a plate representing a flame holder and to a three dimensional flow in a domain representing a section of flame tube fed by lateral orifices. This method permits the simulation of the establishment of the cold flow from rest, then an ignition initiated in a small zone at high temperature and the resulting oscillations, as well as the onset of a permanent flame. E.D.K.

ANALYSIS OF LOW-FREQUENCY DISTURBANCES IN AFTERBURNERS

Frank E. Marble, Malladi V. Subbaiah, and Sebastien Candel, M. *In* AGARD Combustor Modelling Feb. 1980 11 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

The behavior of stabilized flame zones were examined when they were situated in an afterburner. The turbine discharge and the nozzle inlet planes were represented by appropriate admittance functions for low frequencies. The distances which separate turbine discharge, flame holders, and nozzle throat, as well as the number of flame holders, were parameters in the problem. The results show that small disturbances which originate in combustion roughness, may be amplified to serious amplitudes and the amplitude level is a strong function of the geometric parameters of the flame-afterburner arrangement. In some instances instability may result. R.E.S.

N80-27387# International Flame Research Foundation, Ijmuiden (Netherlands).

SURVEY ON PREDICTION PROCEDURES FOR THE CALCULATION OF FURNACE PERFORMANCE

J. B. Michel, S. Michelfelder, and R. Payne *In* AGARD Combustor Modelling Feb. 1980 16 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

The numerous published mathematical models for the prediction of furnace heat transfer were classified into three categories. The degree of subdivision chosen for the heat transfer calculations (dimensionality) was used as the main criterion. It is shown that the flow pattern and the desired accuracy determine the required degree of subdivision, which can be zero dimensional (model type 1), one dimensional (model type 2) or multidimensional (model type 3). The survey on models and some applications show also that all model types have their justification and their specific range of application. Models of the type 1 and 2 are generally considered to be especially suitable for practical furnace calculations and parameter studies. In principle these calculations can also be performed with models of the type 3 although their applicability is as yet confined to special cases which can be handled computationally and where the greater effort and expense is justified. For typical 3D geometries and if pollution emission data are to be predicted, which depend heavily on local properties, the use of type 3 models is indispensable. A.R.H.

NUMERICAL ANALYSIS AND EXPERIMENTAL DATA IN A CONTINUOUS FLOW COMBUSTION CHAMBER: A COMPARISON

F. Gamma, C. Casci, A. Cogne, and U. Ghezzi *In* AGARD Combustor Modelling Feb. 1980 15 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

Measured and computed temperature distribution, axial velocity, and swirl velocity results obtained in an experimental furnace using methane as the fuel are presented and compared. The finite difference solution was obtained to the equations controlling combustion in the combustion chamber which was essentially a cylinder of inner 200 mm diameter with a test length of 1,000 mm. The fuel nozzle was placed axially in the injection head and the oxidizer was fed by two different lines. Primary air flowed through a tube surrounding the fuel nozzle, and the dilution air entered at the periphery of the injection head. In general, the agreement between theory and experiments can be considered as acceptable. A.R.H.

MODELING FURNACES FED WITH OXYGEN-ENRICHED AIR [MODELISATION DES FOURS ALIMENTES A L'AIR ENRICHI EN OXYGENE]

R. Guenot, A. Ivernel, F. C. Lockwood, and A. P. Salooja *In* AGARD Combustor Modelling Feb. 1980 12 p refs In FRENCH Prepared in cooperation with Imperial Coll. of Science and Technology, London, England (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

The numerical modeling of combustion chambers with furnaces fed with oxygenated air presents particular problems related partly to the thermal dissociation produced by high temperatures, and partly to the increased role played by radiative transfer. A model is presented for including these phenomena in existing calculations. The method is in the process of verification by means of measurements obtained on an experimental 300 kW furnace designed to operate with high intensity boilers fed by natural gas and oxygenated air or pure oxygen. The first experimental results are in good agreement with predictions made using the model. Transl. by A.R.H.

AN EFFECTIVE PROBABILISTIC SIMULATION OF THE TURBULENT FLOW AND COMBUSTION IN AXISYMMETRIC FURNACES

Th. T. A. Paauw, A. J. Stroo, and C. W. J. Vanloppen *In* AGARD Combustor Modelling Feb. 1980 22 p refs (For primary document see N80-27371 18-07)

Avail: NTIS HC A17/MF A01

The conservation equations governing the flow field and the combustion process in isothermal and in diffusion controlled combusting confined flows are solved using a numerical finite difference technique; the results are compared with measurements. The combustion process of the hydrocarbon fuel was modeled by using instant reaction with fluctuations in the mixture fracture, and with three different assumptions for the chemical conditions: frozen chemistry, equilibrium chemistry and partial equilibrium chemistry. Attention is paid to the formation of nitrogen oxides, and it is shown that in hydrocarbon diffusion flames a substantial amount of the NO formed is due to prompt NO formation. An effective model is presented for this process. Author

MATHEMATICAL MODELING OF BOILER OPERATIONS

[MODELISATION MATHEMATIQUE DU FONCTIONNEMENT DES CHAUDIERES DE CHAUFFAGE]
E. Perthuis *In* AGARD Combustor Modelling Feb. 1980 24 p refs In FRENCH (For primary document see N80-27371 18-07)
Avail: NTIS HC A17/MF A01

During a cooperative study of small boilers for domestic heating, a mathematical model was developed which describes the phenomena regulating the boiler operations and studies their evolution as a function of practical parameters. The operations of a given apparatus can be simulated in continuous or discontinuous regime. The influences on the boiler of such a parameters as heat insulation, load factor, boiler control, and control of the differential of the aquastat can be estimated. The order of magnitude of heat maintenance can also be predicted, something which is difficult to determine on a test bed.

A CHEMICAL REACTOR MODEL AND ITS APPLICATION TO A PRACTICAL COMBUSTOR
W. Krockow, B. Simon, and E. C. Parnell (Rolls-Royce Ltd., Bristol, England) *In* AGARD Combustor Modelling Feb. 1980 19 p refs Sponsored in part by Bundesministerium der Verteidigung (For primary document see N80-27371 18-07)
Avail: NTIS HC A17/MF A01

A computer model of a combustion chamber is presented, which in its approach is based on chemical reactors. The reactive flow field of the combustor primary zone is divided into elements (vortices) with different mixture ratios and residence times. The variations in concentration in each element are calculated by means of a detailed kinetic reaction mechanism, in which the decomposition of the fuel to carbon monoxide and hydrogen is described by a one-step-quasi-global reaction rate. Each element born in the primary zone of the combustor reacts according to its residence time and is subsequently followed on its way through the remaining zones of the combustor by the computer, with discrete amounts of air being added corresponding to the boundary conditions in the combustor. Idealization of the model (normal distribution) is supported by measurement of the gas concentration at the outlet from the primary zone of a vaporiser-annular combustion chamber. Comparison between the calculated primary zone and outlet concentrations of nitric oxide, CO and unburned hydrocarbons and the measurements show very good agreement.

SEMI-EMPIRICAL CORRELATIONS FOR GAS TURBINE EMISSIONS, IGNITION, AND FLAME STABILIZATION
A. M. Mellor *In* AGARD Combustor Modelling Feb. 1980 13 p refs (For primary document see N80-27371 18-07)
(Contract F33615-77-C-2069)
Avail: NTIS HC A17/MF A01

For operating conditions where the fuel evaporation rate is fast compared to the fuel vapor/air mixing rate, a characteristic time model has been formulated to predict gaseous emissions and efficiency in terms of combustor inlet conditions and geometry. The model, which involves kinetic and fluid mechanic times, has been used to design low metric oxide burners, and study of several different conventional engine combustors suggests that the correlation may be universal. A related model, which includes a fuel droplet evaporation time, is being validated with data from laboratory combustors for spark ignition and lean flame stabilization. The preliminary application of this latter model to engine situations is described.

COMBUSTION MODELLING WITHIN GAS TURBINE ENGINES, SOME APPLICATIONS AND LIMITATIONS
J. Odgers *In* AGARD Combustor Modelling Feb. 1980 14 p refs (For primary document see N80-27371 18-07)
Avail: NTIS HC A17/MF A01

Some of the more pertinent models postulated to describe the performance of gas turbine combustors are reviewed. Six different design/development stages are considered: (1) the initial sizing of a combustor; (2) the initial development testing; (3) primary zone modelling; (4) secondary zone modelling; (5) dilution zone modelling; and (6) changes due to the alteration of ambient conditions. The models are assessed in scope 1 plausibility, experimentally, and in terms of time and economic justification. For (1) it is suggested that a zero-dimensional model suffice, as also for (2). Item (3) will probably require a three dimensional model; (4) and (5) with probably suffice with A zone or two dimensional model. For item (6) a zero-order model might well be satisfactory. If it can be produced with sufficient accuracy, a single complex (probably three dimensional) model could adequately describe all items, (1) to (6). The need of future data, the type of models which may be used currently, and those which are likely to be used in the future are discussed.

AERODYNAMIC STUDY OF A COMBUSTION CHAMBER WITH A VIEW TO ITS SEMI-EMPIRICAL MODELLING
Patrick Hebrard and Philippe Magre *In* AGARD Combustor Modelling Feb. 1980 18 p refs In FRENCH; ENGLISH summary (For primary document see N80-27371 18-07)
Avail: NTIS HC A17/MF A01

The prediction of combustion performance and of polluting species formation in turbomachine combustors requires a calculation method that takes into account all phenomena taking place in various parts of the combustion chamber. Among these, aerodynamic effects, often very poorly known, must be introduced to justify modelling methods based on a combination of elementary combustors; these methods rest on a correct description of their features and their relationships: location, nature, volume, flowrate and distribution, connexions. To this end, experiments were carried out on a combustor model, both without and with combustion, with a view to: (1) characterize the combustor aerodynamics, by visualizations in the water tunnel and velocity measurements on an aerodynamic model; (2) measure residence times in a flame tube by thermodilution (aerodynamics) and particle dynamics (water tunnel); and (3) determine the combustion efficiency and the polluting species production for each regime. Using these results for the development of a one dimensional model of elementary combustors makes it possible to calculate the distribution function of residence time in all elmentary reactors, especially in the primary zone. The overall performance of the combustor can also be predicted. The agreement between calculated and experimental results is satisfactory if the simplicity of the assumptions on which the model is based is considered.

COUPLED BENDING-TORSION FLUTTER IN CASCADES WITH APPLICATIONS TO FAN AND COMPRESSOR BLADES Ph.D. Thesis
Oddvar Olav Bendiksen 1980 270 p
Avail: Univ. Microfilms Order No. 8015952

A method is presented for determining the aeroelastic stability boundaries of a cascade with aerodynamic, inertial, and structural coupling between the bending and torsional degrees of freedom. The real rotor is modeled as an infinite two dimensional cascade of identical harmonic motion, with an arbitrary but constant interblade phase angle. Lane's assumption about the possible flutter mode shapes is assumed to hold. Two different unsteady aerodynamic theories are incorporated into the flutter analysis. The first is Whitehead's solution for the unsteady incompressible flow through an oscillating cascade. The second is a solution for the unsteady supersonic flow through a cascade with a subsonic leading edge locus. The aeroelastic stability boundary of the cascade is obtained by solving a complex eigenvalue problem, analogous to the isolated wing case. The eigenvalue problem is solved directly, and the critical interblade phase angle is determined by minimizing the flutter speed with respect to this

phase angle, while maintaining the restrictions imposed by Lane's assumption. Boundaries are presented for both the incompressible and the supersonic case, for several cascade configurations, locations of elastic axis, coupling strength, and structural damping. Dissert. Abstr.

09 RESEARCH AND SUPPORT FACILITIES (AIR)

SYSTEM DESCRIPTION AND ANALYSIS. PART 1: FEASIBILITY STUDY FOR HELICOPTER/VTOL WIDE-ANGLE SIMULATION IMAGE GENERATION DISPLAY SYSTEM Final Report
Oct. 1977 198 p Sponsored in part by Army Air Mobility and Research and Development Lab. and Ames Research Center, Mountain View, Calif.
(Contract NAS2-9351)
(NASA-CR-152376; NOR-77-102-Pt-1) Avail: NTIS HC A09/MF A01 CSCL 14B

A preliminary design for a helicopter/VSTOL wide angle simulator image generation display system is studied. The visual system is to become part of a simulator capability to support Army aviation systems research and development within the near term. As required for the Army to simulate a wide range of aircraft characteristics, versatility and ease of changing cockpit configurations were primary considerations of the study. Due to the Army's interest in low altitude flight and descents into and landing in constrained areas, particular emphasis is given to wide field of view, resolution, brightness, contrast, and color. The visual display study includes a preliminary design, demonstrated feasibility of advanced concepts, and a plan for subsequent detail design and development. Analysis and tradeoff considerations for various visual system elements are outlined and discussed. E.D.K.

STUDY OF OPTICAL TECHNIQUES FOR INDIRECT GENERATION OF RUNWAY APPROACH LIGHTS Final Report, Sep. 1978 - Sep. 1979
James C. Bremer, L. James Happel, and Ronald A. Parise Sep. 1979 55 p refs
(AD-A080434; ORI-TR-1557) Avail: NTIS HC A04/MF A01 CSCL 01/5

The steel towers which are currently used to support runway approach lights present a significant collision hazard to landing aircraft, and are being replaced by frangible towers which reduce, but do not eliminate, this hazard. This study analyzes optical concepts for indirect generation of runway approach lights which would reduce the tower height or the mass of elevated components. Three concepts are investigated: projection of images with mirrors, use of a ground based lamp in conjunction with a diverging mirror in the light plane, and use of a fiber optic light pipe. The projection of images can achieve a height reduction of several feet, but would require the construction and maintenance of large mirrors. The other two techniques could eliminate wiring from elevated structures, but would require more complex optics and higher levels of power consumption. None of these techniques appears to be practical when the marginal benefits are weighted against their complexity and cost. GRA

SPACE CONSTRUCTION SYSTEM ANALYSIS STUDY: PROJECT SYSTEMS AND MISSIONS DESCRIPTIONS Final Report
26 Apr. 1979 301 p refs
(Contract NAS9-15718)
(NASA-CR-160748; SSD-79-0077) Avail: NTIS HC A14/MF A01 CSCL 22A

Three project systems are defined and summarized. The systems are: (1) a Solar Power Satellite (SPS) Development Flight Test Vehicle configured for fabrication and compatible with solar electric propulsion orbit transfer; (2) an Advanced Communications Platform configured for space fabrication and compatible with low thrust chemical orbit transfer propulsion; and (3) the same Platform, configured to be space erectable but still compatible with low thrust chemical orbit transfer propulsion. These project systems are intended to serve as configuration models for use in detailed analyses of space construction techniques and processes. They represent feasible concepts for real projects; real in the sense that they are realistic contenders on the list of candidate missions currently projected for the national space program. Thus, they represent reasonable configurations upon which to base early studies of alternative space construction processes. E.D.K.

CONCEPTUAL DESIGN OF TWO-PHASE FLUID MECHANICS AND HEAT TRANSFER FACILITY FOR SPACELAB
B. F. North and M. E. Hill Jun. 1980 190 p refs
(Contract NAS3-21750)
(NASA-CR-159810; GDC-CRAD-80-002) Avail: NTIS HC A09/MF A01 CSCL 14B

Five specific experiments were analyzed to provide definition of experiments designed to evaluate two phase fluid behavior in low gravity. The conceptual design represents a fluid mechanics and heat transfer facility for a double rack in Spacelab. The five experiments are two phase flow patterns and pressure drop, flow boiling, liquid reorientation, and interface bubble dynamics. Hardware was sized, instrumentation and data recording requirements defined, and the five experiments were installed as an integrated experimental package. Applicable available hardware was selected in the experiment design and total experiment program costs were defined. Author

SHUTTLE PROGRAM. ONORBIT NAVIGATION INTEGRATOR RESULTS FOR TYPICAL SHUTTLE ORBITS
Oscar W. Olszewski Jul. 1979 40 p refs
(NASA-TM-81092; JSC-16011; Rept-79-FM-25) Avail: NTIS HC A03/MF A01 CSCL 22A

Three types of navigation onorbit numerical integrators were evaluated: (1) power integrators with no delta-V incorporation, just coasting (using Taylor series expansion integrators); (2) coasting integrators using the Cowell method of special perturbations; and (3) coasting integrator using the Pines variation of parameter perturbation method. Results show that the super G integrator is a very simple and effective for 2 and 4 second time steps. Since IMU delta-V data can be easily incorporated in the integration scheme, its use as the standard onorbit navigation propagator for the maintenance of the current state was implemented in the onboard navigation software. The Pines formulation method with a Runge-Kutta-Gill fourth-order integrator method produces excellent results up to 300 second time steps. On orbit prediction with this method was implemented in the onboard onorbit navigation scheme. The Runge-Kutta third order, using Cowell's method, is an excellent general purpose determination integrator for time steps up to a 60 second duration. A.R.H.

STS-1 OPERATIONAL FLIGHT PROFILE. VOLUME 3: ASCENT, CYCLE 3
May 1980 300 p refs Revised
(NASA-TM-81096; JSC-14483-Vol-3-Rev-1; Rept-78-FM-51-Vol-3-Rev-1) Avail: NTIS HC A13/MF A01 CSCL 22A

The ascent opeational flight profile for the space transportation system 1 flight is designed (1) to limit the maximum undispersed dynamic pressure to 580 lb/sq ft, (2) to follow the design load indicator profiles where q alpha is a specified profile and q beta is desired to be as close to zero as passible, and (3) to maximize nominal and abort performance. Significant trajectory parameters achieved are presented. A maximum dynamic pressure of 575 lb/sq ft was achieved, a minimum q alpha of -2187 lb-deg/sq ft was achieved, and q beta was limited to approximately + or - 100 lb-deg/sq ft in the high q region of the trajectory. The trajectory performance allows a press to main engine cutoff capability with one space shuttle main engine out at 262 seconds ground elapsed time. The orbital maneuvering system burns achieve a final orbit of 150.9 x 149.9 x 149.8 n. mi. and the desired inclination of 40.3 degrees. E.D.K.

ORBITER S-BAND DIRECT LINK SYSTEM VERIFICATION TEST REPORT
B. K. Vermillion May 1980 141 p refs
(NASA-TM-81110; JSC-16680) Avail: NTIS HC A07/MF A01 CSCL 22B

Space-to-ground S-band communications system compatibility and performance tests were performed for the various radio frequency links. These tests consisted of the various uplink and downlink signal combinations (data rates) for the phase modulation system and both realtime and playback data rates for the frequency modulated downlink systems. In addition, tests involving encryption/decryption, Doppler, and acquisition were performed. Results show that the S-band transponder for the space shuttle orbiter is compatible with the S-band equipment of the AFSCF/RTS (Air Force Satellite Control Facility/Remote Tracking Station). It is also concluded that the performance of the orbiter-AFSCF/RTS direct link exceeds the required performance and that this communications link will meet the system requirements of the Space Transportation System. SPACE SHUTTLE MAIN ENGINE PLUME RADIATION MODEL
John E. Reardon and Young C. Lee Dec 1978 196 p refs (Contract NAS8-29270)
(NASA-CR-161498; RTR-014-7) Avail: NTIS HC A09/MF A01 CSCL 21H

The methods are described which are used in predicting the thermal radiation received by space shuttles, from the plumes of the main engines. Radiation to representative surface locations were predicted using the NASA gaseous plume radiation GASRAD program. The plume model is used with the radiative view factor (RAVFAC) program to predict sea level radiation at specified

body points. The GASRAD program is described along with the predictions. The RAVFAC model is also discussed. F.O.S.

RETRIEVAL TECHNIQUES: LVLH AND INERTIALLY STABILIZED PAYLOADS
J. A. Yglesias May 1980 42 p
(NASA-TM-81099; JSC-16425; Rept-80-FM-12) Avail: NTIS HC A03/MF A01 CSCL 22B

Procedures and techniques are discussed for retrieving payloads that are inertially or local vertical/local horizontal (LVLH) stabilized. Selection of the retrieval profile to be used depends on several factors: (1) control authority of the payload, (2) payload sensitivity to primary reaction control system (PRCS) plumes, (3) whether the payload is inertially or LVLH stabilized, (4) location of the grapple fixture, and (5) orbiter propellant consumption. The general retrieval profiles recommended are a V-bar approach for payloads that are LVLH or gravity-gradient stabilized, and the V-bar approach with one or two phase flyaround for inertially stabilized payloads. Once the general type of profile has been selected, the detailed retrieval profile and timeline should consider the various guidelines, groundrules, and constraints associated with a particular payload or flight. Reaction control system (RCS) propellant requirements for the recommended profiles range from 200 to 1500 pounds, depending on such factors as braking techniques, flyaround maneuvers (if necessary), and stationkeeping operations. The time required to perform a retrieval (starting from 1000 feet) varies from 20 to 130 minutes, depending on the complexity of the profile. The goals of this project are to develop a profile which ensures mission success; to make the retrieval profiles simple; and to keep the pilot workload to a minimum by making use of the automatic features of the orbiter flight software whenever possible. F.O.S.

AN ATTITUDE ACQUISITION TECHNIQUE FOR DUAL-SPIN SPACECRAFT Ph.D. Thesis
Carl Henry Hubert 1980 125 p
Avail: Univ. Microfilms Order No. 8015681

Alignment of the spacecraft rotor axis with the angular momentum vector is achieved by spinning up the rotor, and then allowing passive energy dissipation mechanisms to act while the rotor is made to spin at a constant rate relative to the remainder of the spacecraft. If the rotor spin rate is correct, the desired state will be asymptotically stable, no other stable state will exist, and the alignment will be achieved. The validity of this technique is demonstrated by an energy analysis, illustrated by a geometrical technique, and confirmed by the results of computer simulations. It is demonstrated that, with the proper choice of rotor speed, the initial conditions and dynamic history of the spacecraft during rotor spin up are irrelevant to the ultimate convergence of the rotor axis to the desired orientation. Because of this, a number of maneuvers previously thought to be impossible are now known to be feasible. Dissert. Abstr.

SHAPE CHANGE OF GALILEO PROBE MODELS IN FREE-FLIGHT TESTS
Chul Park and Charles F. Derose Jun. 1980 41 p refs
(NASA-TM-81209; A-8223) Avail: NTIS HC A03/MF A01 CSCL 22B

Scale models of the Galileo Probe made of polycarbonate, AXF5Q graphite, carbon-carbon composite, and carbon-phenolic were flown in a free flight range in an ambient gas of air, krypton, or xenon. Mach numbers varied between 14 and 24, Reynolds numbers between 300,000 and 1,000,000, stagnation pressures between 31 and 200 atm, and stagnation point heat transfer rates between 10 and 1,000 kW/sq cm. Shadowgraphs indicate gouging ablation of the aft portion of the frustum; the gouging was moderate in air and severe in the noble gases. The graphite models break in the same region. An explanation of the phenomena is offered in terms of the strong compression and shear caused by the reattachment of a turbulent separated flow. Conditions are calculated for similar tests appropriate for Von Karman Facility of the Arnold Engineering Development Center in which a larger model can be flown in argon. Author

THE DYNAMICS AND CONTROL OF LARGE FLEXIBLE SPACE STRUCTURES, 3. PART A: SHAPE AND ORIENTATION CONTROL OF A PLATFORM IN ORBIT USING POINT ACTUATORS Final Report
Peter M. Bainum, A. S. S. R. Reddy, R. Krishna, and Paul K. James Jun. 1980 179 p refs
(Grant NsG-1414)
(NASA-CR-163253) Avail: NTIS HC A09/MF A01 CSCL 22B

The dynamics, attitude, and shape control of a large thin flexible square platform in orbit are studied. Attitude and shape control are assumed to result from actuators placed perpendicular to the main surface and one edge and their effect on the rigid body and elastic modes is modelled to first order. The equations of motion are linearized about three different nominal orientations: (1) the platform following the local vertical with its major surface perpendicular to the orbital plane; (2) the platform following the local horizontal with its major surface normal to the local vertical; and (3) the platform following the local vertical with its major surface perpendicular to the orbit normal. The stability of the uncontrolled system is investigated analytically. Once controllability is established for a set of actuator locations, control law development is based on decoupling, pole placement, and linear optimal control theory. Frequencies and elastic modal shape functions are obtained using a finite element computer algorithm, two different approximate analytical methods, and the results of the three methods compared. THE FATE AND BEHAVIOR OF FUEL-SULFUR IN COMBUSTION SYSTEMS Ph.D. Thesis
John Charles Kramlich 1980 225 p
Avail: Univ. Microfilms Order No. 8015151

The behavior of sulfur during the combustion of methane, propane, acetylene, hydrogen, and a mixture of hydrogen and carbon was studied in a modified Longwell jet-stirred reactor operating at 0.92 atmospheres. Sulfur dioxide was shown to represent the majority of the flame sulfur and the sulfur behavior observed was, to first order, independent or sulfur additive type. The results for the hydrogen flame were consistent with the assumption that the sulfur species were mutually equilibrated within the non-equilibrium flame. A partial equilibrium model predicted that, after SO2, SO was the most important flame species. A chemical kinetic probe model was applied to the modeled combustion gases which resulted in the reduction of sampled SO into H2S within the probe at fuel-rich conditions; at fuel-lean conditions, SO was oxidized into SO2. The results for the hydrocarbon flames indicated that the measured H2S, COS, and CS2 were probe formed from sulfur in the reactive intermediates SO, CS,S and SH. Dissert. Abstr.

A COMPUTER PROGRAM FOR THERMAL RADIATION FROM GASEOUS ROCKET EXHUAST PLUMES (GASRAD)
John E. Reardon and Young C. Lee Dec. 1979 183 p refs
(Contract NAS8-29270)
(NASA-CR-161496; RTR-014-9) Avail: NTIS HC A09/MF A01 CSCL 21H

A computer code is presented for predicting incident thermal radiation from defined plume gas properties in either axisymmetric or cylindrical coordinate systems. The radiation model is a statistical band model for exponential line strength distribution with Lorentz/Doppler line shapes for 5 gaseous species (H2O, CO2, CO, HCl and HF) and an appoximate (non-scattering) treatment of carbon particles. The Curtis-Godson approximation is used for inhomogeneous gases, but a subroutine is available for using Young's intuitive derivative method for H2O with Lorentz line shape and exponentially-tailed-inverse line strength distribution. The geometry model provides integration over a hemisphere with up to 6 individually oriented identical axisymmetric plumes, a single 3-D plume. Shading surfaces may be used in any of 7 shapes, and a conical limit may be defined for the plume to set individual line-of-signt limits. Intermediate coordinate systems may specified to simplify input of plumes and shading surfaces. Author

INERT GAS ION THRUSTER DEVELOPMENT Interim Report, Apr. 1978 - Feb. 1979
William D. Ramsey Mar. 1980 99 p refs
(Contract NAS3-21345)
(NASA-CR-159805; XEOS-2372; IR-1) Avail: NTIS HC A05/MF A01 CSCL 21C

Two 12 cm magneto-electrostatic containment (MESC) ion thrusters were performance mapped with argon and xenon. The first, hexagonal, thruster produced optimixed performance of 48.5 to 79 percent argon mass utilization efficiencies at discharge energies of 240 to 425 eV/ion, respectively, Xenon mass utilization efficiencies of 78 to 95 percent were observed at discharge energies of 220 to 290 eV/ion with the same optimized hexagonal thruster. Changes to the cathode baffle reduced the discharge anode potential during xenon operation from approximately 40 volts to about 30 volts. Preliminary tests conducted with the second, hemispherical, MESC thruster showed a nonuniform anode magnetic field adversely affected thruster performance. This performance degradation was partially overcome by changes in the boundary anode placement. Conclusions drawn the hemispherical thruster tests gave insights into the plasma processes in the MESC discharge that will aid in the design of future thrusters. Author

Progress is reported on four distinct projects which are administered as a group. The individual projects are identified as tasks and reported on separately. A summary for each task follows: Task I. Work concerned improvement and application of the impedance tube method for measurement of the pressure-coupled combustion response of solid propellants and measurement of the bulk damping in the product flow. Improvements included increased sites and amplitude range of pressure measurements; increased capacity of the data acquisition system; and a modified, more rapid data reduction program. Admittances and bulk loss coefficients of nonaluminized and aluminized propellants were measured over a range of frequencies. Task 2. Studies were continued on external burning using an axisymmetric model at Mach 3. Tests with actual combustion of radially and axially injected hydrogen are then reported. Outstanding performance values with significant base drag reduction is shown for injection and burning directly in the near-wake (base burning). Task 3. Investigations continued on the accumulation processes of aluminum on the propellant burning surface that lead to formation of agglomerate droplets, the size of which dominates aluminum combustion. Task 4. Experimental and analytical studies were continued on the subject of turbulence-induced pressure fluctuations in a rocket-like cavity. A new theory was constructed for the generation of pressure disturbances by the turbulence. Undeniable separation has been achieved between propagational and local pressure fluctuations, and the agreement is adequate. GRA

MULTICOLOR INVERSION DIAGNOSTIC FOR TACTICAL MOTOR PLUMES Interim Report
Stephen J. Young May 1980 93 p
(Contract F04701-79-C-0080; AF Proj. 5730)
(AD-A083904; TR-0080(5623)-1; AFRPL-TR-80-30) Avail: NTIS HC A05/MF A01 CSCL 21/2

A theoretical and analytical analysis is presented on the application of multispectral emission/absorption inversion to the retrieval of temperature and concentration profiles of tactical rocket motor plumes. Consideration is given to both monochromatic and band model spectral scales. A main conclusion drawn from the analysis is that application in the infrared on either the monochromatic or wide band spectral scale cannot yield adequate inversions for small plumes with mild temperature gradients such as those encountered for tactical rocket motor. Even under the most ideal circumstances, temperature and concentration errors up to 30% are encountered. The failing of the method is due to the lack of spatial resolution inherent in the inversion weighting functions. GRA

THE STATISTICAL STRENGTH OF FIBROUS MATERIALS AS INFLUENCED BY FIBER LOAD-SHARING AND GEOMETRIC CONFIGURATION Ph.D. Thesis
Roland Evan Pitt 1980 205 p
Avail: Univ. Microfilms Order No. 8015720

A linear spring model is presented for approximating the mechanics of a fiber matrix composite. It is observed that in long tubular structures, the load of a failed fiber is spread over a greater number of fibers than local load sharing predicts, but the load is mainly concentrated on the four nearest neighbors, with tapering. As the structure length becomes small in relation to the material properties, the load sharing is found to become that of equal load sharing or local sharing, depending on whether the fiber ends are uniformly deflected or uniformly stressed. The results of the linear spring model are used in the calculation of probablity distributions for the strength of small tubular and hexagonal bundles using the method of failure sequences. In both arrangements, the fibrous assembly exhibits greater mean strength and about the same variability in strength as it would under local load sharing. The linear spring model is also used in the development of a tapered load sharing rule for large tubular bundles and a local load sharing rule for large hexagonal bundles. Dissert. A. tr.

FEASIBILITY OF KEVLAR 49/PMR-15 POLYIMIDE FOR HIGH TEMPERATURE APPLICATIONS
Morgan P. Hanson 1980 16 p refs Proposed for presentation at the 12th Natl. SAMPE Tech. Conf., Seattle, 7-9 Oct. 1980
(NASA-TM-81560; E-521) Avail: NTIS HC A02/MF A01 CSCL 11D

Kevlar 49 aramid organic fiber reinforced PMR-15 polyimide laminates were characterized to determine the applicability of the material to high temperature aerospace structures. Kevlar 49/3501-6 epoxy laminates were fabricated and characterized for comparison with the Kevlar 49/PMR-15 polyimide material. Flexural strengths and moduli and interlaminar shear strengths were determined from 75 F to 600 F for the PMR-15 and from 75 F to 450 F for the Kevlar/3501-6 epoxy material. The effects of hydrothermal and long-term elevated temperature exposures on the flexural strengths and moduli and the interlaminar shear strengths were also studied. Author

INVESTIGATION OF APPLICATION PARAMETERS AND TESTING OF RAIN EROSION COATINGS Final Technical Report
G. W. Kelly 13 Mar. 1980 93 p refs
(Contract N00019-78-C-0125)
(AD-A083578; Rept-2-30400/OR-52380) Avail: NTIS HC A05/MF A01 CSCL 11/4

This program was sponsored in order that the performance of selected rain erosion coatings might be evaluated and that those parameters affecting the performance of these materials might be studied with the goal in mind to upgrade rain erosion coatings for use on high performance aircraft. In order to realize this goal, the following characteristics of two select polyurethane materials were evaluated: coating adhesion to the reinforced composite substrates; solvent evaporation rates or 'solvent release' from each select rain erosion coating material for the purpose of reducing coating porosity of the cured material; a polymerization study related to the chemical reactivity of these moisture reactive materials after exposure to known quantities of free water; a coating familiarization study for each of the rain erosion coating materials; radar signal attenuation studies to determine signal losses through the rain erosion coating; and high-speed erosion tests for selected coating materials and primer combinations. CYLINDRICAL SHELLS OF BIMODULUS COMPOSITE MATERIAL
Charles W. Bert and V. Sudhakar Reddy Feb. 1980 25 p refs Proposed for presentation at the ASCE Natl. Conv., Hollywood, Fla., 27-31 Oct. 1980
(Contract N00014-78-C-0647; NR Proj. 064-609)
(AD-A083974; OU-AMNE-80-3; TR-12) Avail: NTIS HC A02/MF A01 CSCL 11/4

Certain fiber-reinforced materials, especially those with slightly curved fibers in very soft matrices, exhibit considerably smaller stiffnesses when loaded in compression than when loaded in tension. Examples are tire cord-rubber, wire-reinforced solid

propellants, and certain soft biological tissues. For purposes of analysis and design, such materials can be modeled as a bimodulus material, i.e., one having one set of stiffnesses when the fiber-direction strain is tensile and another set when this strain is compressive. Using the fiber-governed bimodulus-material model introduced several years ago by the senior author and verified for cord-rubber composites, the present authors extend their previous work on the deflection of single-layer and cross-ply laminated rectangular plates to circular cylindrical shells of the same construction. A closed-form solution is presented for a thin, freely supported, cylindrically curved panel under sinusoidally distributed loading. Numerical results are presented to show the effect of shell curvature on the neutral-surface positions and deflection. GRA

COMPOSITE PYROELETRIC MATERIALS Final Technical Report, 1 Jul. 1978 - 30 Sep. 1979
R. E. Newnham and A. S. Bhalla 30 Jun. 1979 53 p refs
(Contracts N00014-78-C-0291; MDA903-78-C-0306; ARPA Order 3617)
(AD-A083726) Avail: NTIS HC A04/MF A01 CSCL 11/4

Pyroelectric materials develop electric charge with temperature change. They are used in thermal device applications such as surveillance, burglar alarms and vidicon night-image systems. Greater pyroelectric sensitivity is needed for many vidicon applications. We are exploring ways of increasing the pyroelectric figure-of-merit (pyroelectric coefficient/permittivity) through the use of composite materials. In this report we discuss the results of work carried out at Penn State and at the North American Philips Laboratory (Dr. J. Dougherty and Dr. W. Smith). The design principles and experimental data for a model system are described in the section entitled Pyroelectric PZT composites. For PZT-Spurrs composites with parallel connectivity, the pyroelectric figure-of-merit is more than five times larger than for a poled PZT ceramics. GRA

VIBRATION OF COMPOSITE STRUCTURES
Charles W. Bert Mar. 1980 25 p refs Presented at Intern. Conf. on Recent Advan. in Structural Dyn., Southampton, England, 7-11 Jul. 1980
(Contract N00014-78-C-0647; NR Proj. 064-609)
(AD-A084069; OU-AMNE-80-6; TR-13) Avail: NTIS HC A02/MF A01 CSCL 11/4

The purpose of this paper is to review some of the recent contributions to the field of vibration of composite structures. The topics of fatigue and fracture, while quite important in the overall dynamic performance of composite structure, are not considered in this survey. The survey treats these topics: dynamic stiffness and damping of composite materials, beams and curved bars and rings, flat panels, and cylindrically curved panels and shells. It concludes with some suggestions for future research. It is well established that fiber-reinforced composite materials, by virtue of the geometry of the fibers acting stiffeners, behave macroscopically like homogeneous but anisotropic materials. The class of elastic symmetry depends upon the geometric arrangement of the fibers. GRA

(AD-A083795; TR-26) Avail: NTIS HC A02/MF A01 CSCL 11/4

Metal Matrix Composites (MMCs) have generated considerable interest in the materials field, because of their potential applications in dynamic structures. A MMC with its excellent mechanical as well as physical properties carries a distinct advantage over other composite systems, particulary at high temperatures. At the same time a MMC system is characterized by heterogeneity, anisotropy and interfaces which affect those properties considerably. Interfaces have been known to influence the properties of MMCs significantly and their importance has been discussed extensively. However, the interface chemistry and its exact role in alteration of various properties is not well-known yet. One of the important things needed for better understanding of the interface is its stress state. Thermal and mechanical treatments involved in the fabrication of composite materials, give rise to triaxial residual stresses. Speculations are that these stresses, originating from the differing thermal coefficients of the reinforcement and the matrix, play an important part in the transverse properties of the MMCS. GRA

SATURATED ATOMIC FLUORESCENCE AS A DIAGNOSTIC TOOL FOR FLAMES AND PLASMAS Ph.D. Thesis
James Neill Bower 1979 178 p
Avail: Univ. Microfilms Order No. 8016512

An experimental approach to the determination of three flame diagnostic parameters is developed. The experimental application of saturated atomic fluorescence to the measurement of quantum efficiency, total number density, and noise power is discussed. Data for quantum efficiency and total number density are compared to the scant literature values. Four elements and three different flame compositions are investigated. Preliminary noise power spectra are discussed as background for the use of saturated atomic fluorescence to measure noise in the atomization and nebulization processes. Dissert. Abstr.

The timing characteristics of the SPEAR beam (pulse width less than or equal to 0.4 nsec, pulse repetition period = 780 nsec) were exploited to determine dynamic behavior of atomic, molecular, excimeric, and photodissociative gas phase species excited by vacuum ultraviolet radiation. Fast fluorescence timing measurements were done to determine excited state lifetimes of Kr and Xe. Pressure dependent timing studies on Xe gas at higher concentrations demonstrated some of the problems associated with previous kinetic modeling of the Xe2 system. It was found that even qualitative agreement of observed Xe2 lifetimes as a function of pressure required the assumption that the radiative lifetime was a strong function of internuclear separation. CROSSED BEAM REACTIVE SCATTERING OF OXYGEN ATOMS AND SURFACE SCATTERING STUDIES OF GASEOUS CONDENSATION Ph.D. Thesis
Steven Jay Sibener 1979 239 p
Avail: Univ. Microfilms Order No. 8014880

A series of beam surface scattering experiments are described which examined the internal and translational energy dependence of molecular condensation probabilities for collisions involving either CCl4 or SF6 and their respective condensed phases. It is conclusively demonstrated that excitation of a polyatomic molecule's rational and vibrational degrees of freedom can inhibit its probability of sticking upon impact with a cryogenically cooled surface. Dissert. Abstr.

A MULTITECHNIQUE APPROACH TO SURFACE STUDIES OF METALS AND ALLOYS USING X-RAY PHOTOELECTRON SPECTROSCOPY AND SECONDARY ION MASS SPECTROSCOPY Ph.D. Thesis
George James Slusser 1979 203 p
Avail: Univ. Microfilms Order No. 8015520

X-ray photoelectron spectroscopy (XPS or ESCA) and secondary ion mass spectrometry (SIMS) were combined into the same ultrahigh vacuum system to the study of the reactions occuring on metal and alloy surfaces. The XPS and SIMS instrumentation are contained in separate vacuum chambers, which are interconnected with a set of magnetically driven UHV-compatible sample transfer devices. The effectiveness of the approach was demonstrated in determining the effects of the interaction of charged particles on the surface electronic structure and composition of PdAg alloys of various compositions, and the reaction of CO with polycrystalline foils of Ag, Pd and PdAg alloy. The chemisorption of oxygen on these same polycrystalline foils was also investigated to elucidate the various mechanisms by which oxygen is chemisorbed on these surfaces. Adsorption of O2 is very fast on Pd, reaching saturation at 2L. Adsorption of O2 on Ag is slow, with only 0.1 monolayer of oxygen detected by XPS after 10,000 L exposure. Adsorption of O2 on the 79% PdAg alloy is similar to that of Ag. Dissert. Abstr.

THE KINETICS AND MECHANISM OF THE FORMATION OF OZONE BY THE ANODIC OXIDATION OF WATER Ph.D. Thesis
Peter Chadwick Foller 1979 294 p
Avail: Univ. Microfilms Order No. 8014680

The kinetics and mechanism of the synthesis of ozone by the anodic oxidation of water is described. Relevant prior work in oxygen and ozone evolution kinetics is critically evaluated in discussions of both the optimization of ozone current efficiency, and in speculations as to the mechanism of its formation. The beta crystalline form of lead dioxide is shown to be the most effective anode material for the evolution of ozone. Ozone evolution current efficiencies in many different electrolytes are assessed, and a rationale is developed to explain their sequence. The rationale is based both on the adsorptivity of the anions on anode surfaces, and their electronegativity, that is, their ability to stabilize intermediate cationic species. In general, fluoro-anion electrolytes are found to give higher ozone yields than oxy-anion electrolytes. Dissert. Abstr.

OPTICAL SPECTROSCOPY OF MOLECULES ABSORBED ON THE NICKEL (111) SURFACE Ph.D. Thesis
Antonio Rafael Gallo 1979 217 p
Avail: Univ. Microfilms Order No. 8014691

The ultraviolet spectra of various organic molecules adsorbed to a clean metal surface are studied using spectroscopic ellipsometry. An ultrahigh vacuum system equipped with a liquid helium cooled crystal holder is used to prepare and characterize a clean metal surface and control the formation of the absorbed overlayer. The first observation of excited state vibrational frequencies of pyridine and pyrazine overlayers physisorbed on the nickel (III) surface is reported. The possible interactions of the adsorbed molecule with the metal surface, and propose a geometrical structure for the adsorbed overlayer are discussed. Dissert. Abstr.

LOW ENERGY ION MOLECULE REACTIONS IN CHEMICAL IONIZATION aY MASS-ANALYZED ION KINETIC ENERGY SPECTROMETRY Ph.D. Thesis
Douglas Cameron 1979 238 p
Avail Univ Microfilms Order No 8015435

The technique of mass analyzed ion kinetic energy spectrometry (MIKES) was used to obtain structural and thermochemical information from several types of ion/molecule reactions. The site of protonation was of particular interest in terms of studying the intrinsic properties of molecules and in studying the fragmentation patterns of even-electron ions. The MIKE spectra of protonated molecular ions, in general, do not provide unambiguous results concerning the site of protonation, but with deuterium labeling evidence was obtained for ring protonation of phenol and aniline. Ethylation of these substrates was done to model the protonation process. For phenol, ring ethylation, apparently occurs exclusively, while aniline shows competitive ring and N-ethylation. Results for the protonation and ethylation of the isometric cresols and toluidines were also determined. Dissert Abstr

The oxygen plasma oxidation of GaAs was studied in order to obtain extremely high frequency responses with MOS devices. In the multipole system a homogeneous oxygen plasma of high density can easily be obtained in a large volume. This system is thus convenient for the study of plasma oxidation of GaAs. The electrical properties of the MOS diodes obtained in this way are controlled by interface states, located mostly in the upper half of the band gap where densities in the 10 to the 13th power/(sq cm) (eV) range can be estimated. Despite these interface states the possibility of fabricating MOSFET transistors working mostly in the depletion mode for a higher frequency cut-off still exists. E D K

The structural chemistry of complexes between aluminum chloride and other metal chlorides is important both for practice and theory. Condensed-phase as well as vapor-phase complexes are of interest. Structural information on such complexes is reviewed. The first emphasis is given to the molten state because of its practical importance. Aluminum chloride forms volatile complexes with other metal chlorides and these vapor-phase complexes are dealt with in the second part. Finally, the variations in molecular shape and geometrical parameters are summarized. Author

A conceptual design of a diagnostic system using coherent anti-Stokes Raman Spectroscopy (CARS) to determine time resolved temperature and species concentrations in the Army Mechanics and Materials Research Center ballistic compressor has been formulated. Performance calculations have been carried out for hydrogen which is an ideal diagnostic species for this application. Results are also presented of computer code calculations of collision narrowed spectra of nitrogen. Several pump laser systems were compared, and a high repetition frequency Nd:YAG laser was determined to be superior. Population saturation, stimulated Raman gain, and optical breakdown are not expected to pose severe limitations on laser intensity or measurement signal-to-noise ratios. Consideration is given to problems pertinent to operation of the ballistic compressor including compressor recoil, window deflections and generation of CARS from the test section windows. Finally, the possibility of using pulsed stimulated Raman gain spectroscopy (SRGS) as an alternative to CARS at the high densities typical of the ballistic compressor has been identified. SRGS appears to offer adequate measurement ability and possesses certain advantages over CARS. GRA

Reflected shock waves were used to heat N2O/C2H6/CO/Ar and N2O/CH4/CO/Ar mixtures to temperatures of 1875-2855 K at total concentrations of 5 x 10 to the 18th power CC. Oxygen atom production was monitored via the flame band emission at 450 nm, and CO2 production was observed at 4.27 micrometers. These data were then compared to the results of numerical integration of the rate equations, using rate constant and mechanistic information obtained in earlier studies of H2 and CH2O under similar conditions. For the C2H6 mixture, it was possible to achieve good agreement between these calculations and the observed data using only one addition reaction O + CH3 yields CH2O + OH. The calculations were insensitive to the precise value used, but the results are consistent with recent high temperature literature values. For the CH4 mixture, the best agreement was achieved using a recent high temperature value for O + CH4 yields CH3 + OH. The data indicated that this reaction has a markedly non-Arrhenius rate constant; use of a value based upon low temperature data gives results inconsistent with those observed. The CH4 system was insensitive to any other methane reaction rate constant. There was some experimental evidence to suggest an unsuspected complexity in methyl radical decay channels at the lowest temperatures observed. The mechanism/rate constant combination used here was then applied to the analysis of literature data for CH3 oxidation by O2. This analysis was designed to obtain a value for the rate constant of CH3 + CH3 + O2 yields CH2O. GRA

The effects of initial gas temperature, pressure, density, and energy transfer to the gas in the detonation wave have been studied to develop an equation which can be used to predict the length of transition from deflagration to detonation (induction distance) in confined and unconfined combustible gas mixtures. Flame speeds of various hydrogen-oxygen-inert gas mixtures have been measured to determine the relationship between flame speed (deflagration) and induction distance. A nozzle burner having a sine curve contour was used for these experiments to obtain well-defined laminar flame cones permitting reliable and reproducible evaluations. The quenching distances of methane-air, methane-oxygen, acetylene-air and hydrogen-air flames were not affected by potassium chloride, sodium-bicarbonate, or potassium phosphate coatings on the quenching surfaces. It was also found that the quenching distances of these flames are independent of the linear speed of the unburned gas as long as the flows are laminar. Variations of the burner width also did not affect the quenching distances. However, rather significant increase of the quenching distances were observed when the narrow sides between the quenching distances were observed when the narrow sides between the quenching surfaces were closed. New iteration formulas have been developed to simplify and reduce the computational work for calculating detonation parameters and the performance of thermal engines (ramjet, rocket, gas turbine, and internal combustion engine). HC A04/MF A01 CSCL 21/2

The presence of turbulence alters mixing and reaction times in chemically reactive flows. These effects in turn modify the heat and mass transfer rates and hence the local and global dynamics of combustion systems. The goal of this paper is to first describe the fundamental physical processes we must model to understand reactive flow turbulence and then to show how detailed ab initio modelling of these phenomena may be used to help construct phenomenological turbulence model for reactive flows. Three different aspects of reactive flow mixing are identified as focal points for the detailed modelling and several important criteria are established which an accurate and consistent sub grid reactive flow mixing phenomenology should satisfy. One possible representation for such a generalized phenomenology is presented. GRA

HC A03/MF A01 CSCL 07/4

The Raman spectra of cryosorbed samples of CO2, CO, N2, O2, CH4, NH3, and H2O were obtained. Cryodeposit thickness was nominally 10 to 11 micrometers, and sample temperatures were systematically varied over the range of 17 to 85 K. Spectral scans were obtained for both the lattice mode region (25 to 1/200 cm) and intramolecular vibrational mode region (200 to 2/4000 cm). Additionally, the Raman spectra of single polystyrene latex spheres in diameter and bulk, powdered samples of inorganic particles of NaNo3 and NH4 NO3 were recorded. The dependence of the Raman scattering signature of NaNO2 on sample temperature and the spectral variations as a function of change in concentration of a sample formed from a mixture of NaNO3 and NH3NO3 were investigated. HC A03/MF A01 CSCL 21/2

Two one-dimensional models to predict the temperature history of an explosive surface subject to compressive heating from the rapid collapse of an adjacent air layer are reported herein. Computations made using the more sophisticated finite compression-rate model show qualitative agreement with the experimental behavior while results obtained from the simpler adiabatic compression model are sometimes misleading. The most important observation is that planar one-dimensional gap closure cannot explain ignition as observed in experiments. Several multidimensional effects have been introduced into the models. The results show that enhanced energy transport caused by convection and turbulence must be present in conjunction with

rapid local pressurization and/or convergent air-flow, unless the enhancement is confined to a boundary layer adjacent to the explosive. In addition, the dieseling mechanism of sensitization has been considered indicating that explosive particle sizes small enough to exhibit increased temperature may be present. GRA

EVOLUTION OF DEFLAGRATION IN A COLD COMBUSTIBLE SUBJECTED TO A UNIFORM ENERGY FLUX
A. K. Kapila. Feb. 1980. 35 p. refs
(Contract DAAG29-75-C-0024)
(AD-A083822; MRC-TSR-2040) Avail: NTIS
HC A03/MF A01 CSCL 21/2

The title problem is treated in the limit of large activation energy. It is shown that the evolutionary process takes place in a series of distinct stages, and the spatial and temporal structure of each stage is described. It is found that subsequent to thermal runaway, the behavior of the system resembles that of self-induced combustion, except that the thermal explosion is now confined to a thin surface layer. Burning of an initially cold combustible material is studied. It is assumed that combustion is initiated by heating the surface of the material. This will result in a chemical reaction first occurring at the surface, and then spreading through the material in the form of a flame or deflagration wave. Asymptotic methods are used to study the transient process leading to the establishment of the flame. Attention is confined to solid combustibles, but it is envisaged that the techniques developed here will aid in the eventual understanding of the evolution of gaseous combustion. GRA

ADSORPTION OF TRACE METALS BY HYDROUS FERRIC OXIDE IN SEA WATER. Ph.D. Thesis. Final Report, 1978
Francois Morel and K. C. Swallow. Jan. 1980. 63 p. refs
Submitted for publication
(Grant EPA-R-803738)
(PB80-152804; EPA-600/3-80-011) Avail: NTIS
HC A04/MF A01 CSCL 07D

The adsorption of trace metals by amorphous hydrous ferric oxide in seawater was studied with reference to simple model systems designed to isolate the factors which may have an effect on the isotherms. Results show that the complex system behaves in a remarkably simple way and that the data obtained under various conditons of total metal concentration and total oxide concentration can be reduced to an apparent reaction constant, K which is a function of pH only. the high capacity of the oxide for trace metals renders the concept of a surface reaction useless to explain the uptake of metals. A physical picture of the oxide as a swollen hydrous get permeable to hydrated ions is presented. GRA

THE EFFECTS OF NON-CARBIDE FORMING ELEMENTS ON THE MECHANICAL PROPERTIES AND MICROSTRUCTURE OF A SECONDARY HARDENING STEEL Ph.D. Thesis
Warren Manford Garrison, Jr. 1979. 248 p.
Avail: Univ. Microfilms Order No. 8014694

The influence of additions of Si and a combination of Si and Al on the microstructure and mechanical properties of secondary hardening steels was investigated as a function of austenitizing and tempering temperatures. The secondary hardening steels with Si and Al additions showed a marked improvement in toughness with increasing austenitizing temperature, while the toughness of secondary hardening steels not containing Si or Al decreased with austenitizing temperature. It was observed that the Si and Al - Si additions delayed softening on tempering to temperatures above 550 C. The Si additions were found to completely repress the precipitation of intralath cementite and stabilized the epsilon carbides to tempering temperatures above 400 C. The fracture toughness of some of the secondary hardening steels alloyed with Si and Al was found to be over twice that of conventional medium carbon secondary hardening steels of comparable strength levels. The effect of Si and Mo on tempered martensite embrittlement was also studied. The results show that Si and Mo delay tempered martensite embrittlement to higher tempering temperatures. Dissert. Abstr.

N80-27466 California Univ., Los Angeles.
THE SULFIDATION BEHAVIOR OF NICKEL-CHROMIUM, NICKEL-ALUMINUM, AND NICKEL-CHROMIUM-ALUMINUM ALLOYS WITH AND WITHOUT YTTRIUM Ph.D. Thesis
Evan J. Vineberg. 1980. 217 p.
Avail: Univ. Microfilms Order No. 8016056

The sulfidation kinetics were determined using a continuous weight gain system. Mechanisms of the sulfidation reactions were deduced from the kinetics behavior, scale analyses, and morphological observations. Marker experiments were performed for several of the alloys. Analytical tools used in the study included X-ray diffraction analysis, metallographic examination, scanning electron microscopy, X-ray energy dispersive analysis, X-ray mapping, and Auger analysis. Except for the alloys with high chromium content (50 w/o chromium), the mechanism of scale formation was found to be one of counter-current diffusion with a net inward flux of sulfur. The scales were nonprotective, and linear kinetics were observed. In the presence of 50 w/o chromium, a protective Cr_2S_3 layer formed by outward cation diffusion, and parabolic kinetics were observed. The rate of sulfidation was shown to decrease with increasing chromium and aluminum concentrations. The addition of 1 w/o yttrium

consistently reduced the sulfidation rate. It is postulated that the presence of yttrium promotes the formation of a Cr2S3 and/or Al2S3 layer which is more protective than that which forms in the absence of yttrium. Dissert. Abstr.

N80-27467 California Univ., Berkeley.
AN INVESTIGATION OF THE MICROSTRUCTURE AND MECHANICAL PROPERTIES OF THICK SECTION Cr-Mo STEELS Ph.D. Thesis
Rameshchandra Jitendrakumar Kar 1979 161 p
Avail: Univ. Microfilms Order No. 8014755

An investigation was carried out to correlate the microstructure and mechanical behavior in thick section Cr-Mo steels. It was found that the transformation products of slow-cooled 2.25 Cr-1Mo steel, consisted of mixtures of bainite and polygonal ferrite. The bainitic carbides were a mixture of interand intra-lath cementite and it was found that these played an important role during subsequent tempering. These poor properties were attributed to undesirable morphologies of the microconstituents in 2.25 Cr-1Mo steel. It was found that minor additions of Ni/Mn were effective in eliminating free ferrite from slow-cooled 2.25 Cr-1Mo. The effect of Ni/Mn alloy modification was to alter the tempering response of the continuously cooled bainites. Precipitation of alloy carbides was observed at lower temperatures than in the 2.25 Cr-1Mo base alloy. Temper embrittlement studies were carried out on commercial heats of 2.25 Cr-1Mo and two of its Ni-Mn modifications. Dissert. Abstr.

N80-27468 California Univ., Berkeley.
THE MECHANISM OF MICROSTRUCTURAL CHANGE AND ITS CONSEQUENCES IN A LOW CARBON 6 NICKEL ALLOY Ph.D. Thesis
Jungihl Kim 1979 130 p
Avail: Univ. Microfilms Order No. 8014759

The mechanism of microstructural changes during a three-step thermomechanical treatment and the effects of resulting microstructures on mechanical properties were investigated in a low carbon Fe-6Ni alloy. Refinement of the grain size appeared to be achieved after two step treatment. Heating by temperature cycling up to the austenite reversion temperature was found primarily to refine prior austenite grains. Controlled rolling was revealed to be an effective means to replace these thermal cyclings. Two-phase tempering showed ultrafine grains through two phase decomposition and development of subgrains with large angle grain boundaries. In the first intercritical annealing process, regions of high alloy element concentration were provided and these regions were revealed to be preferential sites for a second two phase decomposition. The effects of the stable precipitated austenite were found to be beneficial to fracture toughness by either scavenging a deleterious carbide precipitation in the austenite or by preventing a sharp crack propagation. Dissert. Abstr.

BETA DECOMPOSITION IN BINARY Ti-Cr ALLOYS Ph.D. Thesis
V. Chandrasekaran 1979 162 p
Avail: Univ. Microfilms Order No. 8013509

The transformation behavior and properties of binary Ti-Cr alloys were studied with special emphasis on the following: (1) the isothermal transformation from the metastable beta to the transitional omega phase; (2) the influence of microstructure on the temperature coefficient of electrical resistivity (TCR); (3) the mechanical properties and fracture modes associated with the beta plus omega and omega reverted microstructure. The lack of one-to-one correspondence between the beta and the omega precipitates is consistent with separate nucleation sites for the omega phase. Evidence is presented which suggests that the final transition to discrete omega particles is triggered by strain. The omega morphology is not well defined during the initial stages of precipitation. With continued aging the morphology is distinctly platelike and the omega particles form parallel to the [110] beta and [112] beta planes. The negative TCR was established as a singular property of the metastable beta phase. The TCR is very sensitive to omega precipitation and can be used to monitor the onset and progress of the omega reaction during aging and deformation. Dissert. Abstr.

THE STRENGTH AND PLASTIC PROPERTIES OF DILUTE COPPER-TITANIUM ALLOY SINGLE CRYSTALS Ph.D. Thesis
James Greggi, Jr. 1979 254 p
Avail: Univ. Microfilms Order No. 8015380

Cu-1.2 at percent Ti (0.9 wt percent) alloy single crystals were grown by a modified Bridgment technique and seeded to produce orientations close to the 'soft' [123] direction. Solution treated and quenched tensile specimens were aged at 673 K for times up to 2 x 10,000 min. Simple tensile tests were conducted over a temperature range extending from 77 K to 473 K at a nominal strain rate of 8.3 x 0.0001/sec. For crystals aged to contain discrete, order beta particles, plastic flow was initiated by the formation and propagation of a Luders band, followed by uniform deformation up to the maximum load. The coarse secondary slip formed as a stable Luders band at 77 K but led to tensile instability and fracutre at higher test temperatures. The yield strength and various parameters related to the deformation behavior such as workhardening rates, extent of primary slip, overshoot of the symmetry boundary, and the coarseness and disposition of the secondary slip bands were all found to vary systematically with particle size and strength and testing temperature. The aging response was initially weak but increased significantly for aging times between 10 min and 1,000 min. For aging times longer than 1,000 min, the aging response decreased sharply, but the yield strength continued to increase slowly resulting in a broad aging peak. Dissert. Abstr.

THE MICROSTRUCTURAL BEHAVIOR OF AUSTENITE DUE TO HOT ROLLING Ph.D. Thesis
Elliot Lewis Brown 1979 309 p
Avail: Univ. Microfilms Order No. 8015376

The microstructural behavior of High-Strength Low-Alloy (HSLA) austenite subjected to relatively simple thermomechanical treatments as well as more complexed treatments are discussed. The following areas are emphasized: (1) starting material characterization and behavior during reheating; (2) thermomechanical treatment of typical C-Mn and HSLA steel compositions in the form of single and double pass (50 percent reduction) rolling schedules; and (3) thermomechanical treatment of a model, stable austenitic material. The microstructural behavior is characterized by optical microscopy, transmission electron microscopy, electron diffraction, analysis of chemically isolated precipitates, and crystallographic texture measurement. The importance of AlN and microalloy precipitation in controlling the microstructural behavior of the steel during reheating is emphasized. Abnormal grain growth resulted at low to intermediate austenite reheat temperatures and rapid normal grain growth at high austenite temperatures. Dissert. Abstr.

THE MAGNETIC PROPERTIES OF AMORPHOUS (Fe-Ni-Co)-METALLOID ALLOYS Ph.D. Thesis
Daniel Paul Musser 1980 164 p
Avail: Univ. Microfilms Order No. 8014728

The magnetic properties of several amorphous transition metal-metalloid alloys were studied with Fe-57 Mossbauer spectroscopy. The transition metal elements in the alloys are Fe, Ni, and Co; the metalloid elements are B, P, C, and Al. The alloys studied included several series in which the Fe to Ni or Fe to Co concentration is varied, with the metalloid concentration being fixed; several in which the metalloid concentration is varied with the metal concentration being fixed; and the binary series Fe sub x B sub 100-x. Dissert. Abstr.

The influence of the rate of heating on the position of the critical points of iron-cobalt alloys was studied. It is shown that when an alloy with 8% Co by weight is heated at the rate of 7000 deg/sec, a shift in the temperature of phase conversion of almost 30 deg occurs. When an alloy with 15% Co by weight is heated at the same rate, the conversion temperature is shifted by approximately 20 deg. For an alloy with 15% Co by weight, for which under ordinary conditions of heating the points of phase conversion and magnetic randomization (the Curie point) coincide, it was possible to show that for high rates of heating, a separation with respect to temperature occurs which clearly confirms the fact of the shift in the critical points of phase conversion. This program was initiated on 1 January 1978. During 1979, the effect of copper content on the FCP behavior of four Al-6Zn-2Mg-XCu-T7351 alloys was investigated in dry air and distilled water and compared with last year's study of the T651 condition. The peak-aged-treatment exhibited a lower growth rate in dry air over the range of delta K studied, and also displayed a higher threshold and resistance to fatigue cracking near the threshold in the distilled water environment. Decomposition of hydrazine has been studied on Ir(111) from temperatures below 200k up to 1500k using a supersonic molecular beam scattering system. The decomposition begins around 200k producing nitrogen, ammonia, and hydrogen. An extremely strong angular dependence was found for nitrogen. This is the first time normally directed emission of nitrogen has been observed for surface decomposition. A Fourier transform of the entire waveform has been utilized to deduce the details of the decomposition mechanism. Photoemission from hydrazine and ammonia on Ir(111) using high intensity polarized UV radiation has been investigated. The results are consistent with the data from the scattering experiments. AES was used to monitor the absorption of oxygen on Al(111) surfaces and was found to be dependent on both time and oxygen pressure. Further studies will concentrate on the kinetics of aluminum oxidation. GRA

ELECTRONIC EFFECTS OF SULFUR IN NICKEL: A MODEL FOR GRAIN BOUNDARY EMBRITTLEMENT Interim Report
C. L. Briant and R. P. Messmer 10 Apr. 1980 19 p refs
Prepared in cooperation with General Electric Co., Schenectady, N.Y. Submitted for publication
(Contract N00014-79-C-0991)
(AD-A083649; TR-1) Avail: NTIS HC A02/MF A01 CSCL 11/6

This paper reports the first study employing detailed electronic structure calculations to investigate a model of grain boundary embrittlement. The results show that adding sulfur to a cluster of nickel atoms causes strong bonds to be formed between the sulfur atom and the nickel atoms nearest to it, while simultaneously weakening bonds between these nickel atoms and their neighboring nickel atoms in the cluster. As a consequence one can suggest that sulfur forms very strong bonds within the plane of the boundary but weakens metal-metal bonds perpendicular to this plane. Although, for the present, the results can be considered only as suggesting one possible embrittlement mechanism, they do demonstrate the insight which such calculations can provide into this very central question of grain boundary embrittlement. (Contract N00014-78-C-0270)
(AD-A083643; TR-2) Avail: NTIS HC A04/MF A01 CSCL 11/6

Fatigue crack initiation can be affected by surface phenomena and the possibility exists for improving the fatigue performance by altering the state of the surface without greatly changing bulk properties. This program was initiated on 1 March 1978, with the objective of determining the effect of ion implantation and ion plating on the cyclic stress-strain response and fatigue crack nucleation of a metal substrate. To meet this objective, we have selected surface film-substrate combinations designed to separate the various parameters, e.g., crystal structure, SFE, shear modulus, misfit, residual stress, etc., which control near surface deformation and associated crack initiation. This report summarizes our progress during the period 1 March 1979 - 29 February 1980. Three aspects of the program are discussed: (1) The effect of silver and nickel ion plating on the low and high cycle fatigue behavior of polycrystalline copper, (2) x-ray diffraction analysis of ion implanted crystals, and (3) the effect of aluminum-ion implantation on the fatigue crack initiation of polycrystalline copper. DETERMINATION OF RESIDUAL STRESS BY MAGNETOMECHANICAL ACOUSTIC EMISSION
Kanji Ono, M. Shirata, and May M. Kwan Apr. 1980 22 p refs Presented at ASM Conf. on Residual Stress for Designers and Engrs., Chicago, 9-10 Apr. 1980
(Contract N00014-75-C-0419)
(AD-A084065; TR-80-01-ONR) Avail: NTIS HC A02/MF A01 CSCL 11/6

This paper presents a newly discovered method for residual stress measurements. It applies to ferromagnetic materials only, but has a greater depth of penetration than X-ray diffraction and other methods, and is nondestructive. Materials under test are subjected to alternating magnetic fields. When internal structures of magnetic domains are altered, ultrasonic waves are generated; that is acoustic emission. This magnetomechanical acoustic emission (MAE) depends on the level of residual stress. It is also affected by the chemical composition, microstructure (heat treatment) and prior cold working of the material. Basic behavior and dependencies of MAE are to be described. Several applications will be discussed, including MAE measurements on structural shapes, welds and railroad rails. GRA

IRON-BASED ALLOYS STRENGTHENED BY TERNARY

LAVES PHASES
J. S. Dunning 1980 19 p refs
(PB80-157233; BM-RI-8411) Avail: NTIS HC A02/MF A01 CSCL 11F

As a possible substitute for the solid solution strengthening of chromium and nickel, the precipitation hardening characteristics of a number of binary iron-based systems in which Laves phase precipitates, such as Fe2Mo, are formed were investigated. Several hardening responses were observed, but none was ideal. The Fe-Ta binary system had the highest magnitude of hardening, even with low alloy additions, and the Fe-Mo system had unique stability at temperature. Accordingly, the Fe-Mo-Ta system was selected for study to determine if a ternary Laves phase could combine high hardening with long-term stability at elevated temperature. GRA

The design of turbine disks for high performance aircraft gas turbine engines requires an elevated temperature, time dependent fatigue lifetime prediction method for advanced nickel base superalloys. Two prominent empirical methods, strain range partitioning and frequency modified fatigue life, contain elements that are suited to representing viscoplastic and oxidation assisted cracking but require modification to meet the requirements of turbine disk design in the early stages of use. In addition, these methods have not yet been applied successfully to the formation and link up of microcracks and thus are not suitable where this process constitutes the major portion of the initiation lifetime. THE BIOSYNTHESIS OF NATURAL RUBBER AND OTHER HYDROCARBON POLYMERS Ph.D. Thesis
Kevin Richard Hirschbuehler 1979 243 p
Avail: Univ. Microfilms Order No. 8012196

The rate at which rubber and/or hydrocarbon latices isolated from various plants incorporate isopentenyl pyrophosphate and sodium acetate was determined. The latices used were obtained from Hevea brasiliensis, Euphorbia tirucalli, Ficus elastica, Castilla elastica, and Manihot glaziovii. All of these latices continued to generate rubber (or hydrocarbon) after isolation. They converted isopentenyl pyrophosphate and sodium acetate to water insoluble hydrocarbon polymers. Latices isolated from various plants significantly in their rate of rubber and hydrocarbon production. Euphorbia tirucalli latex was significantly more reactive to sodium acetate incorporation than the other latices, and Hevea brasiliensis latex was significantly more reactive to isopentenyl pyrophosphate incorporation than the other latices. EFFECT OF W AND WC ON THE OXIDATION RESISTANCE OF YTTRIA-DOPED SILICON NITRIDE
Susan Schuon 30 Apr. 1980 12 p refs Presented at the Annual Meeting of the Am. Ceramic Soc., Chicago, 28-30 Apr. 1980
(NASA-TM-81528; E-9744) Avail: NTIS HC A02/MF A01 CSCL 07C

The effect of W and WC contamination on the oxidation and cracking in air of sintered Si3N4 - 8 w/o Y2O3 ceramics at 500, 750, and 1350 C is examined. A mixture of Si3N4 - 8Y2O3, milled with alumina balls, was divided into four portions. Three portions were doped with 2 w/o WC W, and 4 w/o W respectively, in order to simulate contamination during milling. The fourth portion was undoped and used on a control. The addition of W or WC did not affect the phase relationships in the system, as all bars with or without additions contained melilite as the major Si-Y-O-N phase after sintering. At 750 C, instability (rapid oxidation and cracking) of W-doped bars appears to have occurred as a result of oxidation of the tungsten containing melilite phase. No intermediate temperature instability was observed in bars containing 2 w/o WC or in bars with no additive. Specimens exposed at 1350 C had good oxidation resistance due to the formation of a protective siliceous oxide layer. A specimen containing 4 w/o W which was preoxidized at 1350 C had improved oxidation resistance at 750 C. The tendency towards oxidation and cracking of Si3N4 - 8 Y2O3 at 750 C is concluded to be related to tungsten content of the sintered bars. M.G.

EFFECT OF STARTING POWDER CHARACTERISTICS ON DENSITY, MICROSTRUCTURE AND LOW TEMPERATURE OXIDATION BEHAVIOR OF A Si3N48w/o Y2O3 CERAMIC
Susan Schuon and Sunil Dutta 1980 23 p refs Presented at the Ann. Meeting of the Am. Ceramic Soc., Chicago, 28-30 Apr. 1980
(NASA-TM-81536; E-490) Avail: NTIS HC A02/MF A01 CSCL 07D

The densification and oxidation behavior of Si3N4 - 8w/oY2O3 prepared from three commercial starting powders were studied. Bars of SN 402, SN 502, and CP 85/15 were sintered for 3 to 4.5 hours at 1750 C. A second set was hot pressed for 2 hours at 1750 C. The microstructures were studied by transmission electron microscopy and scanning electron microscopy, densities were determined, and the phase compositions were determined by X-ray diffraction. Densification and microstructure were greatly influenced by the starting powder morphology and impurity content. Although SN 402 exhibited the maximum weight lose, the highest sintered and hot pressed densities were obtained with this powder. All powders had both equiaxed and elongated grains. Sintered bars were composed of beta silicon nitride and n-melelite. In contrast, hot pressed bars contained beta silicon nitride, H-phase, and J-phase, but no melelite. Yttria distribution in sintered bars was related to the presence of cation impurities such as Ca, Fe, and Mg. A limited oxidation study at 750 C in air showed no instability in these Si3N4 - 8 w/oY2O3 specimens, regardless of startin powder. Author

TEAR STRENGTH AND TENSILE STRENGTH OF MODEL FILLED ELASTOMERS
P. Dreyfuss, A. N. Gent, and J. R. Williams 10 Apr. 1980 29 p refs
(Contract N00014-76-C-0408; NR Proj. 092-555)
(AD-A083168; TR-7) Avail: NTIS HC A03/MF A01 CSCL 11/9

Measurements have been made of the tear strength, tensile strength, and energy dissipated during stretching for model filled elastomers consisting of polybutadiene with glass beads incorporated. The glass beads were pretreated with various silanes, some of which could, in principle, form covalent bonds with the polybutadiene matrix during free-radical crosslinking of the latter and some of which could not. The tear strength of the elastomer was increased by the addition of glass beads, by about 25 per cent for the largest beads, having a mean diameter of 150 micrometers. This effect is attributed to increased roughness of the tear path. The breaking elongation in tension was reduced by the addition of glass beads but the breaking stress was only seriously reduced for the least-well-adhering beads. GRA

The Primary Adhesively Bonded Structure Technology (PABST) program's overall objective was to demonstrate significant improvements in cost, integrity, and durability of primary fuselage structures using latest adhesive bonding techniques, materials, and processes. Accordingly, this document summarizes the findings during Phase 3, Fabrication, and details highlights of the Manufacturing and Quality Assurance effort in the areas of Tooling and Fabrication. Construction of the Full Scale Demonstration Component (FSDC) provides important performance comparisons of various bond tools, surface preparation techniques, adhesives, primers, bagging approaches and inspection methods. The fabrication of large constant and non-constant section bonded panels for the FSDC also provided invaluable manufacturing experience; established a natural testbed for validation of Phase 2, Detail Design; and yielded excellent feedback for advancement of the PABST technology in Engineering, Materials and Process, and Quality Assurance. EFFECT OF CVD TUNGSTEN AND TaClaC COATINGS ON THE MECHANICAL BEHAVIOR OF SiC(C)

I. Ahmad, N. Hill, and W. Heffernan Dec. 1979 49 p refs

(DA Proj. 1L1-62105-AH-84)

(AD-A083395; AD-E440058; ARLCB-TR-79035) Avail: NTIS HC A03/MF A01 CSCL 11/3

Effects of the chemically-vapor-deposited tungsten and TaC coatings on the mechanical properties of silicon carbide (carbon core) filament have been investigated. In the temperature range of interest, because of the possible chemical interaction of tungsten with carbon rich silicon carbide phase on its surface and the columnar grain structure of the coating the filament was found to be embrittled. However, by controlling the initial nucleation of tungsten by adjusting the temperature, the direction of flow of reactants and filament speed, the degradation effect of the coating can be minimized. TaC coating did not decrease the strength of the filament, because it did not react with the filament and had fine grain structure. Coatings of tungsten and TaC decreased the 100 hr 2000 deg F, rupture strength of the filament from 1.9 GN/sq M (280 Ksi) to respectively 1.05 GN/sq M (150 Ksi) and 1.6 GN/sq M (240 Ksi). The tensile strength of the W coated filament was superior to that coated with TaC in the temperature range 1000-1500 deg C. Thermal cycling (room temperature - 1600 deg C) induced cracks in the TaC coating while W coating remained unaffected. GRA

HEAT STABLE POLYMERS: POLYQUINOLINES AND OTHER AROMATIC POLYMERS Final Report, Jan. 1977 - Dec. 1979

J. K. Stille 1 Jan. 1980 35 p refs

(Grant DAAG29-77-G-0177)

(AD-A083129; ARO-1503.12-C) Avail: NTIS HC A03/MF A01 CSCL 11/9

Polyquinolines can be synthesized by an acid catalyzed polymerization reaction that allows a variety of structural modifications, resulting in a range of chain stiffness that can be altered from a relatively flexible amorphous polymer with a moderately low glass transition temperature (250 deg C) to a rod-like molecule with a high degree of crystallinity and a high crystalline transition temperature (>550 deg C). Fibers can be spun and films cast from solution. The rigid rod polyquinolines form anisotropic solutions and, as a result, produce crystalline fibers with a high degree of orientation and a high modulus. A series of polyquinolines containing biphenylene units in the main chain were prepared in order to effect crosslinking reactions of these materials. Crosslinking took place thermally, above the Tg of the polymer, to give insoluble polymers with higher Tg's and higher moduli both above and below Tg. Transition metals catalyze the crosslinking reactions, allowing lower curing temperatures. Polyaramides, polybenzimidazoles and polyquinoxalines could be similarly crosslinked by incorporating biphenylene into these polymers. GRA

(AD-A084448) Avail: NTIS HC A07/MF A01 CSCL 11/9

The results of these experiments indicate that at least a large part of the polarization in PVF2 after poling is due to dipole orientation in the crystalline regions. There is ample evidence to show that crystallites are aligned by the poling field and remain in or close to this new angular position when the field is removed. Aging experiments indicate that they do not return to their original positions even after annealing at high temperature. GRA

LIQUID IMPACT EROSION MECHANISMS IN TRANSPARENT MATERIALS Interim Scientific Report, 30 Sep. 1978 - 30 Sep. 1979

J. E. Field, M. J. Mathewson, and S. vanderZwaag Wright-Patterson AFB, Ohio AFWAL Nov. 1979 47 p refs

(Grants AF-AFOSR-0125-78; AF-AFOSR-3705-78; AF Proj. 2422)

(AD-A084267; AFWAL-TR-80-4057) Avail: NTIS HC A03/MF A01 CSCL 17/5

A study has been made of damage mechanisms caused by liquid drop impact on various infra-red transparent solids. Techniques are described for producing liquid jets which simulate the damage produced by impact with spherical drops. Advantages of this approach are the simplicity of the experimentation, the low construction cost and the broad range of drop size and velocity which can be covered. A hydraulic strength measuring apparatus for brittle materials is described which allows 'residual strengths' to be measured. Materials examined in this report include silicon nitride, zinc sulphide and zinc selenide. GRA

THE COMBUSTION OF CARBON, COAL AND COAL RELATED FUELS IN AN OPPOSED FLOW DIFFUSION FLAME BURNER Ph.D. Thesis
Wing Kai Chin 1979 44 p
Avail: Univ. Microfilms Order No. 8014636

The burning characteristics of various carbonaceous fuels as well as polymethylmethacylate (PMMA) were compared and showed PMMA to have the highest regression rate. The comparison results also indicated that a high rate of volatiles yield enhances the regression rate. The relative importance of oxygen and carbon dioxide on the surface oxidation mechanism was investigated by determining the regression rates in mixtures of oxygen and carbon dioxide and comparing with that obtained in mixtures of oxygen and nitrogen. Because of the opposing effects of carbon dioxide as an oxidizing agent and heat sink, its importance in the surface combustion mechanism could not be unambiguously determined. The gaseous products from the combustion of coal at various oxygen mole fractions and oxidizer velocities were measured and showed that the ratios of carbon monoxide to carbon dioxide decreases with increasing oxygen mole fraction. Temperature profiles in the solid and gas phases and surface temperature were determined. Dissert. Abstr.

THE 2ND INTERNATIONAL SYMPOSIUM ON COAL-OIL MIXTURE COMBUSTION, VOLUME 1
1979 595 p refs Symp. held at Danvers, Mass., 27-29 Nov. 1979 Sponsored by DOE 2 Vol.
(CONF-791160-Vol-1) Avail: NTIS HC A25/MF A01

The status of various coal-oil mixture (COM) programs is assessed, including production, conversion from conventional systems, and demonstration pilot plants. Additional topics include efficiency of both the COM and boilers, combustion byproducts and their environmental effects as well as effects on boilers, and storage tanks. For individual titles, see N80-27495 through N80-27508.

COAL-OIL MIXTURE COMBUSTION APPLIED TO CANADIAN UTILITY BOILERS
P. J. Whalen, F. W. Davies, L. K. Lee, M. Natarajan (Montreal Engineering Co., Ltd.), and R. L. Wang (Montreal Engineering Co., Ltd.) *In* Pittsburgh Energy Technol. Center The 2d Intern. Symp. on Coal-Oil Mixture Combust., Vol. 1 1979 17 p refs (For primary document see N80-27494 18-28)
Avail: NTIS HC A25/MF A01

Operating experience on coal in COM relating to combustion stability, boiler efficiency, boiler slagging/fouling, and equipment erosion are reported. On line oil agglomeration coal beneficiation process is discussed. Based on a nation wide survey conducted on all oil fired canadian utility boilers, cost/benefit analyses of COM conversion for several unit sizes were carried out. Potential oil savings were predicted and a correlation between boiler sizes and break even points for benefit against cost was discussed. A candidate boiler of 100 MW capacity was selected for testing COM process and combustion. E.D.K.

INVESTIGATIONS OF COAL-OIL MIXTURES AS A UTILITY BOILER LIGHT-OFF FUEL
Stephen R. Smith, Randy M. Cole, Ronald B. Cox (Tenn. Univ., Chattanooga), T. C. Derbridge (Acurex Corp., Mountain View, Calif.), R. J. Schreiber (Acurex Corp., Mountain View, Calif.), and A. K. Yasuda (Acurex Corp., Mountain View, Calif.) *In* Pittsburgh Energy Technol. Center The 2d Intern. Symp. on Coal-Oil Mixture Combust., Vol. 1 1979 144 p refs (For primary document see N80-27494 18-28)
Avail: NTIS HC A25/MF A01

The fluid properties of unstabilized and stabilized coal-oil-water mixtures were investigated and the economics of converting light off system of a large (2600-MW) coal fired utility boiler to coal-oil-mixture firing were examined. An experimental agitator was used to determine the following: viscosity; stability; and mixing characteristics of Nos. 2, 4, and 6 fuel oil with pulverized coal. Agitation is required to obtain useful suspensions. A stabilized coal-oil-water emulsion was tested for long-term storage stability. Over a 6-month period, there was no indication of settling. An economic analysis was performed that compares COM costs to the present system using No. 2 oil and the sensitivity of COM economics to significant variables. R.C.T.

STABLE COAL/FUEL OIL DISPERSIONS
C. J. Veal, D. R. Wall, and A. J. Groszek. *In* Pittsburgh Energy Technol. Center. The 2d Intern. Symp. on Coal-Oil Mixture Combust., Vol. 1. 1979. 23 p. refs (For primary document see N80-27494 18-28)
Avail: NTIS. HC A25/MF A01

A novel method was developed for preparing very stable coal/fuel oil dispersions without the use of additives. The dispersions were handled like and substituted for fuel oils. Such dispersions have been shown to be stable at 100 C for periods of at least 13 weeks and also at higher temperatures (150 C) for at least a week. A total of 52 000 litres of such a dispersion were prepared, handled, stored and fired in a system designed primarily for heavy fuel oil. R.C.T.

COMBUSTION OF COAL-OIL MIXTURES IN A 700 HP WATERTUBE BOILER
Y. S. Pan, G. T. Bellas, M. P. Mathur, and D. Bienstock. *In its* The 2d Intern. Symp. on Coal-Oil Mixture Combust., Vol. 1. 1979. 27 p. refs (For primary document see N80-27494 18-28)
Avail: NTIS. HC A25/MF A01

Coal-oil mixtures containing up to 50 percent coal by weight were successfully burned in a 700 high pressure watertube boiler, designed for oil firing, with no derating occuring. Carbon conversion efficiencies were above 98 percent and boiler efficiencies were the same as when firing No. 6 fuel oil. Combustion tests were conducted with No. 6 fuel oil mixed with Pittsburgh Seam coal pulverized to a coal particle size of 90 percent minus 200 mesh. Test results related to boiler performance, pollutant emissions, and ash deposition are presented. The equipment, instrumentation, and data acquisition system of the combustion test facility are described. The modest changes required to adapt the facility designed for oil firing to utilize coal-oil mixtures are discussed. Additional combustion tests needed to assess bottom ash accumulation and the corrosion, erosion, and fouling behavior inherent in the long duration operability of coal-oil mixtures in an oil fired boiler are underway. R.E.S.

DESIGN CONSIDERATION OF FINE COM STORAGE
Morio Kubota, Yashuhiko Kamijo (Tsukishima Kikai Co., Ltd.), and Koichi Tamura (Satake Chemical Equipment Mfg., Ltd.). *In* Pittsburgh Energy Technol. Center. The 2d Intern. Symp. on Coal-Oil Mixture Combust., Vol. 1. 1979. 38 p. (For primary document see N80-27494 18-28)
Avail: NTIS. HC A25/MF A01

Conclusions affecting design and method of using storage tanks for COM are presented. Test items referred to include (1) an agitation test to prevent COM from setting in the tank; (2) fluidization test of COM settled in the tank; (3) still storage test of COM without agitation; (4) heat transfer in the tank; and (5) corrosion testing to determine suitable tank materials. E.D.K.

N80-27507# Hitachi, Ltd., Tokyo (Japan).
REPORT ON PUMPING CHARACTERISTIC TESTS AND PIPING PRESSURE LOSS MEASUREMENT TESTS FOR FINE COM
Isao Koyama. *In* Pittsburgh Energy Technol. Center. The 2d Intern. Symp. on Coal-Oil Mixture Combust., Vol. 1. 1979. 28 p. (For primary document see N80-27494 18-28)
Avail: NTIS. HC A25/MF A01

Data were established for transport of coal-oil mixtures (COM) and developing a design for an actual plant. The tests were carried out with two types of pumps to determine their characteristics and illuminate the pressure loss characteristics for piping transportation of COM. Four types of COM, characterized by the coal brand, coal concentration, and brand of additive mixed in the COM to prevent precipitation of coal particles, were used. The results show that pump handling of the COM is possible. R.C.T.

USE OF PETROLEUM-BASED CORRELATIONS AND ESTIMATION METHODS FOR SYNTHETIC FUELS
A. C. Antoine. Jun. 1980. 23 p. refs
(NASA-TM-81533; E-485) Avail: NTIS. HC A02/MF A01. CSCL 21D

Correlations of hydrogen content with aromatics content, heat of combustion, and smoke point are derived for some synthetic fuels prepared from oil and coal syncrudes. Comparing the results of the aromatics content with correlations derived for petroleum fuels shows that the shale-derived fuels fit the petroleum-based correlations, but the coal-derived fuels do not. The correlations derived for heat of combustion and smoke point are comparable to some found for petroleum-based correlations. Calculated values of hydrogen content and of heat of combustion are obtained for the synthetic fuels by use of ASTM estimation methods. Comparisons of the measured and calculated values show biases in the equations that exceed the critical statistics values.

Comparison of the measured hydrogen content by the standard ASTM combustion method with that by a nuclear magnetic resonance (NMR) method shows a decided bias. The comparison of the calculated and measured NMR hydrogen contents shows a difference similar to that found with petroleum fuels. Author

FUEL PROPERTY EFFECTS ON COMBUSTOR PERFORMANCE Final Report
C. A. Moses and D. W. Naegeli Mar. 1980 54 p refs
(Contract N00140-77-C-1345)
(AD-A084017; SwRI-MED114) Avail: NTIS HC A04/MF A01 CSCL 21/2

Two combustor rigs have been used to study the sensitivities of combustor operation to the physical and chemical properties of fuels. Eighteen fuels including synfuels were used to accentuate the properties of concern: composition, viscosity, and boiling-point distribution. Flame radiation and smoke were best correlated by hydrogen content rather than hydrocarbon structure; the soot formation was due to gas-phase reactions. Lean-blowout conditions were about the same for all fuels except that gasoline could be burned leaner at idle conditions. Ignition limits were more sensitive to volatility than viscosity. Gaseous emissions and combustion efficiency were not significantly affected by fuel properties although some sensitivity to boiling point distribution was evident. In all performance areas, the syncrude fuels correlated in the same ways as the petroleum-derived fuels except for the NOx emissions from the nitrogen containing shale oil fuel. GRA

CARBON SLURRY FUELS FOR VOLUME LIMITED MISSILES Annual Report, Sep. 1978 - Oct. 1979
R. H. Salvesen, D. C. Rigano, W. S. Blazowski, and W. F. Taylor Nov. 1979 219 p refs
(Contract F33615-78-C-2025; AF Proj. 3048)
(AD-A084710; EXXON/PLUS.1KWX.79; AR-1; AFAPL-TR-79-2122) Avail: NTIS HC A10/MF A01 CSCL 21/4

The Air Force has contracted with ER E to develop a carbon slurry fuel with a minimum of 180,000 BTU/gal. This report provides results of the first year's effort of this twenty-seven month program. Initial results indicate that a dispersion of carbon black in JP-10 with select dispersing agents can be made that meets the BTU requirements. Preliminary results look promising. Combustion tests using a specially developed Liquid Fuel Jet Stirred Combustor (LFJSC) have demonstrated that carbon burnout efficiencies greater than 90% are achievable with 300 nm particles in residence times down to 4 ms. Homogeneous iron, lead, manganese, and zirconium catalysts at concentrations up to 1000 ppm proved ineffective as accelerators of carbon burnout. Further tests are in progress to optimize the composition of the most promising formulations and to test these materials under more vigorous conditions in order to determine their suitability for missile applications. THE 1H AND 13C FOURIER TRANSFORM NMR CHARACTERIZATION OF JET FUELS DERIVED FROM ALTERNATED ENERGY SOURCES Final Progress Report, 23 Mar. 1978 - 30 Aug. 1979
H. C. Dorn 30 Aug. 1979 80 p refs
(Contract N00173-78-C-0424)
(AD-A084169) Avail: NTIS HC A05/MF A01 CSCL 07/4

Initially, four jet samples were examined in this phase of the study using gel permeation liquid chromatography. We have previously discussed these results in the six month Progress Report. Although the gel permeation approach has the advantage of nearly quantitative recovery from the chromatography column (typically greater than 95%) and high preparative loading, it suffers from two drawbacks in studies of the present jet fuels. In general, the molecular weight and/or size of the compounds present in typical jet fuels do not cover a broad range. This is an obvious result of the relatively narrow distillation range(s) used to generate the jet fuels. That is, the gel permeation approach is more ideally suited in separations involving mixtures with a broad range in size and/or molecular weight (e.g., 100-1000 MW), whereas, the jet fuels have a more narrow range (e.g., 100-250MW). RESEARCH AND DEVELOPMENT OF RAPID HYDROGENATION FOR COAL CONVERSION TO SYNTHETIC MOTOR FUELS, RISER CRACKING OF COAL Quarterly Report, 1 Apr. - 30 Jun. 1979
D. A. Duncan and J. L. Beeson Nov. 1979 28 p refs
(Contract EX-76-C-01-2307)
(FE-2307-55) Avail: NTIS HC A03/MF A01

The effect of heating rate on the conversion of feed carbon was studied and the distribution of products among gases, hydrocarbon liquids, and spent char was evaluated. A comparison was then made of product distribution obtained by hot hydrogen processing and by concurrent heating of the lignite and hydrogen to pyrolysis temperatures. The distribution of feed carbon among carbon oxides, methane, ethane, and hydrocarbon liquids were similar, and the yield of hydrocarbon liquids was practically identical. Equipment problems encountered thus far were minor and were easily corrected. An equipment flow sheet for a process plant was developed and various processing options were evaluated. DOE

CATALYTIC LIQUEFACTION OF BIOMASS
Manu Seth, Roger Djafar, Gary Yu, and Sabri Ergun Nov. 1979 46 p refs Presented at Thermochem. Conversion Contractor's Meeting, Rolla, Mo., 7 Nov. 1979
(Contract W-7405-eng-48)
(LBL-10091; CONF-791166-1) Avail: NTIS HC A03/MF A01

Two concepts for biomass liquefaction are considered. The first involves solvolytic depolymerization of wood followed by hydrogenation of the resulting slurry (or solution). The second entails the hydrolysis of wood followed by hydrogenation of the hydrolyzed slurry. Acid-catalyzed transfer of hydrogen from solvent molecules is being tested for the hydrogenation step. The effects of process variables on the yields and quality of products are being studied for three catalysts: sodium carbonate, ferric chloride and hydrogen iodide. The effects of reaction temperature, residence time, catalyst concentration, pressure of reducing gases and type of feed (e.g., pre-hydrolyzed slurry vs wood flour) were determined for the ferric chloride system. DOE

PROCESS DEVELOPMENT STUDIES ON THE BIOCONVERSION OF CELLULOSE AND PRODUCTION OF ETHANOL
C. R. Wilke and Harvey W. Blanch Jun. 1979 39 p refs
(Contract W-7405-eng-48)
(LBL-9220) Avail: NTIS HC A03/MF A01

Trichoderma viride strain C-30 was evaluated by comparing cellulose productivity with strain QM 9414. Fermentation operations were conducted in S-liter New Brunswick fermentors. The medium was used for all experiments except that urea was deleted from the medium unless otherwise indicated. Ball-milled solka floc (BW 200) at 1.0% concentration was used as a substrate. Four day old, 10 percent mycelium inoculum was used for all fermentations. The pH was adjusted with 2N NaOH and 2N H2SO4. It is shown that there is an increase in cellulose enzyme activities in addition to an increase in soluble protein. The addition of urea to the fermentation medium effects all the activities except beta-glucosidase and soluble protein. There is a three fold increase in beta-glucosidase activity at 25 C as compared to other temperatures. The increased potency in terms of glucose production is probably due to the selectively higher level of beta-glucosidase in the culture filtrate. The higher level of beta-glucosidase would permit more rapid conversion of cellobiose to glucose. R.C.T.

A STUDY OF PERSISTENT CURRENT IN SUPERFLUID 4He Ph.D. Thesis
Talaghany Roset Khosropour 1980 116 p
Avail: Univ. Microfilms Order No. 8015996

Decay of persistant currents in superleaks in contact with bulk superfluid helium was studied using Doppler shifts of the acoustic modes of an annular resonator partially packed with superleak. The two acoustic modes are an interpolated first-fourth sound and a modified second sound. They have proven to be a usefull means of measuring persistant currents in both the packed and unpacked regions of the waveguide measured at 1.35 K for annuli 10,20, 40, 60, 80, 90, 95, and 100 percent filled with superleak. The main result, which is somewhat surprising, is that the saturated persistent current and its fractional decay rate varies only slightly with superleak depth. This means that the stability of the current in powder is neither affected by the free exchange of mass between the two regions nor is it a strong function of the magnitude of the depth of the powder. Starting from 100% packing the fractional decay rate is about 2% per decade and increases to about 3% per decade at 10% packing. However, there exists a local maximum in decay rate at 90% packing). Another phenomenon which was also studied is the Doppler shift of gravity waves in a partially packed annalus, in relation to its possible application in the detection of persistent currents. DOUBLY-ASYMPTOTIC, BOUNDARY-ELEMENT ANALYSIS OF NONLINEAR SOIL STRUCTURE INTERACTION Final Report, 14 Nov. 1977 - 30 Jun. 1979
P. G. Underwood and T. L. Greer 30 Jun. 1979 68 p refs
(Contract DNA001-78-C-0026)
(AD-A083330; AD-E300725; LMSC/D673964; DNA-4953F) Avail: NTIS HC A04/MF A01 CSCL 20/11

This report describes a doubly-asymptotic (DA), boundary-element (BE) treatment of a surrounding nonlinear soil medium for dynamic soil structure interaction analysis. Linear soil structure interaction is reduced to a surface relationship that is asymptotically exact at both high and low frequencies. Nonlinear soil structure interaction is treated similarly, except a volume contribution is added in the volume; a quasi-static and quasi-dynamic (axisymmetric) problem for which finite-element solutions have been obtained for comparison. For soil behavior based on J sub 2-plasticity theory, reasonable agreement is obtained. For soil behavior based on the Cap model, which is a combined I sub 1- and J sub 2-plasticity theory agreement is not obtained. GRA

ROAD RATER AND BENKELMAN BEAM PAVEMENT DEFLECTIONS Interim Report
Gary W. Sharpe and Herbert F. Southgate Jun. 1979 42 p refs
(PB80-158439; RR-523) Avail: NTIS HC A03/MF A01 CSCL 13B

The Benkelman beam is one of the most commonly used methods of measuring surface deflections of a highway pavement. A Benkelman beam is based on a simple lever-arm principle and uses dial gauges to measure surface deflection under an applied load. The Road Rater applies a sinusoidal force to the pavement at a fixed frequency; surface wave velocities are measured and electronically integrated to obtain surface deflections. Since 1971, work has progressed toward the development of a pavement evaluation methodology using Road Rater deflections. Analyses presented illustrate some relationships between the Benkelman beam and Road Rater deflections. Theoretical and field measured deflections are considered. GRA

PERFORMANCE OF OPEN-GRADED FRICTION COURSES Final Report, Sep. 1977 - Jun. 1979
S. C. Britton, B. M. Gallaway, and R. L. Tomasini Jun. 1979 259 p refs Sponsored in part by Texas State Dept. of Highways and Public Transportation and FHWA
(PB80-162985; TTI-2-9-78-234-1F; FHWA/TX-79/28+234-1F) Avail: NTIS HC A12/MF A01 CSCL 13C

A method for accurately determining open graded asphalt friction course (OGAFC) layer permeability was developed. Specific empasis was placed on predicting the rainfall intensity which causes incipient flooding of the pavement surface. It is shown that this method can be applied for field measurements to monitor the internal drainage capacity of OGAFC overlays when they are constructed as well as to assess changes in this aspect of performance that may result from layer densification by traffic. It is further indicated that such permeability measurements appear to be more practical and meaningful as OFAFC drainage capacity indicators than air void determinations. R.C.T.

OPTIMUM INELASTIC DESIGN OF SEISMIC-RESISTANT REINFORCED CONCRETE FRAME STRUCTURES
Stan W. Zagajeski and Vitelmo V. Bertero (Colorado State Univ., Fort Collins) Jan. 1980 122 p refs
(Grant NSF ENV-76-01419)
(PB80-164635; UCB/EERC-80/03) Avail: NTIS HC A06/MF A01 CSCL 13M

The preliminary design phase of a proposed inelastic design procedure comprises three steps: preliminary analysis, preliminary design, and analysis of the preliminary design. Seismic design story shears are found by a spectral modal analysis technique which includes an approximation to the P-delta effect. A nonlinear optimization technique (the cutting-plane method) is employed at each story to find the beam design moment capacities which minimize a function proportional to the volume of flexural reinforcement. Design constraints are imposed to ensure that a safe, serviceable, and practical design results. Actual member design is found employing computer design aids. In the final

step, the preliminary design is analyzed to evaluate its acceptability. Acceptability is determined by comparing the results of a series of linear elastic and nonlinear analysis with established design criteria and assumptions made in formulating the design problem. GRA

HYSTERIC BEHAVIOR OF REINFORCED CONCRETE STRUCTURAL WALLS
J. M. Vallenas, V. V. Bertero, and E. P. Popov. Aug. 1979. 258 p. refs.
(Grant NSF ENV-76-04263)
(PB80-165905; UCB/EERC-79/20; NSF/RA-79-350) Avail: NTIS. HC A12/MF A01. CSCL 13M.

The behavior of reinforced concrete structural walls subjected to high shear earthquake loading conditions is studied. Results of eight earthquake simulation tests on 1/3 scale structural R/C wall subasemblage model specimens are presented. Details of the test set up, the models tested, and the test procedure are summarized. The main experimental results are evaluated in terms of the hysteretic characteristics (strength, deformation, and energy dissipation capacity), the modes of failure, ease of construction, and effectiveness of repair. Present code design methods for walls are assessed, the seismic-resistant design implications of the results are discussed, and areas of further study are recommended. GRA

DEVELOPMENT OF A REBAR DOWEL ANCHORAGE SYSTEM FOR ATTACHING THE CALIFORNIA TYPE 25 CONCRETE BARRIER TO EXISTING BRIDGES. Final Report
J. P. Dusel, Jr. and J. R. Stoker. Jun. 1979. 127 p. refs. Sponsored in part by DOT.
(PB80-161722; TL-636871; FHWA/CA-TL-79-16) Avail: NTIS. HC A07/MF A01. CSCL 13B.

An anchorage system for attaching New Jersey-shaped concrete bridge replacement barrier onto existing concrete decks was developed. Initially dynamic pullout tests of rebar dowels were conducted to develop methods which would maximize pullout strengths. Ultimate pullout loads ranging from 25.0 kips to 34.8 kips were attained with individual no. 6 rebar dowels. Secondly, static load tests were performed on standards California Type 25 concrete barrier and replacement barriers to determine maximum horizontal loads which could be resisted. In preliminary tests, two 3-foot lengths of replacement barrier, attached with grouted no. 6 rebar dowels, withstood higher horizontal loads than did the standard Type 25 concrete barrier. A 16-foot-long replacement barrier withstood a maximum static horizontal load of 93 kips applied to a concentrated area about 26 inches above the deck surface. GRA

INELASTIC SEISMIC RESPONSE OF A TORSIONALLY UNBALANCED SINGLE-STORY BUILDING MODEL
H. M. Irvine and G. E. Kountouris. Jul. 1979. 172 p. refs.
(Grant NSF ENV-77-14174)
(PB80-164197; NSF/RA-790389; R79-31; Rept-2) Avail: NTIS. HC A08/MF A01. CSCL 13M.

The dynamic effects of coupling between torsion and translocation using a simple torsionally unbalanced single-story building model are described. The investigation deals with a two-degree-of-freedom model in which two frames support a diaphragm the center of mass of which may be offset from the center of stiffness. A comprehensive parameter study was undertaken to identify trends in the peak ductility demands of the worst situated frame. A simple frequency domain analysis outlines why the peak ductility demands occur in the frame farthest from the center of mass. The study indicates that the most important parameter is one involving the product of diaphragm mass and spectral acceleration normalized by a yield level in the frame. GRA

PATCHING FLEXIBLE AND RIGID PAVEMENTS Final Report
Leonard Hartvigas Oct. 1979 49 p
(PB80-161243; RR-74; FHWA/NY/RR-79/74) Avail: NTIS
HC A03/MF A01 CSCL 13B

Available patching materials for both flexible and rigid pavements were evaluated. An infrared heater was also used for cold weather flexible pavement patching. Cold mix and a proprietary mix were used to fill potholes in flexible pavements during two winters; the more expensive proprietary mix proved to be a durable repair material for winter patching. Summer patching was not investigated on flexible pavements because the standard top course mix is used and presents no problems. Fourteen cement base and two asphalt base materials were used to repair rigid pavement. Six cement and one asphalt base materials were used in winter, with only the latter providing good service. NONLINEAR GEOMETRIC, MATERIAL AND TIME DEPENDENT ANALYSIS OF REINFORCED AND PRESTRESSED CONCRETE SLABS AND PANELS Report of Structures and Materials Research
Johannes VanGreunen and A. C. Scordelis Oct. 1979 286 p
(Grant NSF ENV-77-00146)
(PB80-167349; UC-SESM-79-3) Avail: NTIS
HC A13/MF A01 CSCL 13C

A numerical procedure was developed for the material and geometric nonlinear analysis of reinforced and prestressed concrete slabs and panels including the time dependent effects due to load history, temperature history, creep, shrinkage and aging of the concrete, and relaxation of prestress. The procedure, based on the finite element method, is capable of predicting the response of these structures throughout their service load history as well as throughout elastic, cracking, inelastic, and ultimate load ranges. An updated Lagrangian formulation is employed to take the effects of changing structural geometry on the response of planar structures into account. Slabs or panels having an arbitrary tendon layout with either pretensioned, or bonded pr unbonded post-tensioned tendons can be analyzed. A series of numerical examples is presented to study the validity and applicability of the method. GRA

ENHANCED UK TELETEXT MOVES TOWARDS STILL PICTURES
J. P. Chambers Jun. 1980 31 p refs
(BBC-RD-1980/4) Avail: BBC, Kingswood Warren, Tadworth, Surrey, England

Methods are proposed for the enhancement of the UK teletext system leading towards a high-definition still picture capability in addition to row of text and mozaic graphics. A teletext system is described wherein binary code groups are formed into data-lines for inclusion in the television field blanking interval. The control and address information carried on each dataline, together with the special page-header data-lines and the sequence of transmission of the data-lines, allow the data-lines corresponding to the rows of a selected page to be identified. The page structure can be used to send information other than pages of text. Certain data-lines can be used for functions unrelated to teletext. In addition, techniques utilizing a multipage store are examined for improving access; and teh extension of the character repertoire to enhance multilanguage capabilities is addressed. M.G.

MAGNETOSPHERIC PULSATIONS: MODEL AND OBSERVATIONS OF STANDING ALFVEN WAVE RESONANCES Ph.D. Thesis
Howard Joseph Singer 1980 209 p
Avail: Univ. Microfilms Order No. 8016043

Observations of ultra low frequency waves in the Pc 3,4, and 5 period range (10 to 600 sec) are presented. The generation of the waves is examined and the structure and distribution of these waves in space provides evidence to support the notion that many of the waves are standing Alfven wave resonances of the earth's magnetic field lines. In addition, the results of a theoretical model of standing Alfven wave resonances in a realistic magnetospheric magnetic field geometry are presented. Using the basic MHD equations, an equation is derived for the amplitude and period of low frequency transverse standing waves in an arbitrary field geometry. The Olson-Pfitzer field model which includes ring, tail and boundary currents is used, and the results indicate that the predicted period of oscillation can be quite different from that predicted by previous models in dipole field geometries. One important use for the model is for determining densities along field lines in space from ground based observations. Dissert. Abstr.

SPECTRA FROM 50 MHz AURORAL RADAR ECHOES Ph.D. Thesis
Roger Wesley Reed 1980 175 p
Avail: Univ. Microfilms Order No. 8015731

Auroral radar observations made with a radar system operating at 50 MHz with a power of about 10KW and a long dipole array antenna are examined. The radar points north and obtains echoes over a region which extends approximately from L=3.5 to L=5.5. Typical observations had a spatial resolution of 5 to 10 km and temporal resolution of 2s. The early morning of April 1, 1976 was a magnetically very disturbed period with K sub p =8. Some unusual spectra with a very narrow peak at a Doppler shift of about 70 Hz were observed at the southern edge of the westward electrojet, a region where large field-aligned currents are expected. These echoes persisted while the location of the echoing region moved poleward at an average velocity of approximately 1 km/s. Ion cyclotron waves occuring in the lower F-region are a possible scattering source for these unusual spectra. Multiple spectral peaks occured, sometimes with one spectrum containing peaks with both negative and positive Doppler shifts. The structure observed extended to the limits of both spatial and temporal resolution. Implications of these

observations to the instability theories and to ideas on the nature of the auroral electrojet are discussed. Dissert. Abstr.

N80-27548 State Univ. of New York at Buffalo.
HIGH CAPACITY LOW DELAY PACKET BROADCASTING MULTIACCESS SCHEMES FOR SATELLITE REPEATER SYSTEMS. Ph.D. Thesis.
Sanjay Kumar Bose. 1980. 210 p.
Avail: Univ. Microfilms. Order No. 8016354.

Demand assigned packet radio schemes using satellite repeaters can achieve high capacities but often exhibit relatively large delays under low traffic conditions when compared to random access. Several schemes which improve delay performance at low traffic but which have high capacity are presented and analyzed. These schemes allow random acess attempts by users, who are waiting for channel assignments. The performance of these are considered in the context of a multiple point communication system carrying fixed length messages between geographically distributed (ground) user terminals which are linked via a satellite repeater. Channel assignments are done following a BCC queueing discipline by a (ground) central controller on the basis of requests correctly received over a collision type access channel. In TBACR Scheme A, some of the forward message channels are set aside for random access transmissions, the rest are used in a demand assigned mode. Schemes B and C operate all their forward message channels in a demand assignment mode but, by means of appropriate algorithms for trailer channel selection, allow random access attempts on unassigned channels. The latter scheme also introduces framing and slotting of the time axis to implement a more efficient algorithm for trailer channel selection than the former.

ON THE SPATIAL CAPACITY OF PACKET RADIO NETWORKS. Ph.D. Thesis.
John Andrew Silvester. 1980. 153 p.
Avail: Univ. Microfilms. Order No. 8016042.

Point-to-point network can achieve much higher performance levels due to the ability to spatially reuse the channel. Optimum transmission ranges and retransmission policies (maximizing capacity) for various configurations of ALOHA networks are derived. For one dimensional random networks (i.e., random topolgies) with random traffic matrices, satisfied by exactly adjusted transmission range, allowing communication in one hop, a capacity proportional to the logarithm of the number of nodes in the network was obtained. For regular (topology) networks using fixed transmission ranges and multi-hop communication to support uniform traffic matrices, a throughput of 2/e was obtained. For two dimensional networks, throughput proportional to the square root of the number of nodes in the network was obtained for both regular and random topologies. The best regular design is a hexagonal tesselation. The optimum average degree for random networks in which each node uses the same (fixed) transmission radius is shown to be about 6. Several routing algorithms are presented and the best performanced: it is shown that the routing algorithm which balances traffic flow, seems to produce the best performance.

RADIATION COUPLED DYNAMICS OF RAM CONFINED RADIO SOURCES. Ph.D. Thesis.
Gary Guy Rolison. 1979. 90 p.
Avail: Univ. Microfilms. Order No. 8013987.

It is found that internal turbulence generated by coupling between the plasmoid and the external flow, while providing a mechanism for relativistic particle acceleration, causes rapid expansion leading to a decrease in both penetrating power and long term luminosity. However, inclusion of the effects on dynamics of internal energy loss through synchrotron and free-free emission reveals that this energy loss mechanism can dominate the plasmoid's internal energy balance. The resulting plasmoid contraction introduces a new mechanism for the maintenance of relativistic particle energy-compressive work. The scenario in which both compressive work and turbulent particle acceleration occur results in the greatest plasmoid penetration and best long term luminosity maintenance. It is found that a plasmoid which encounters a decreasing background density has an increased tendency to expand, resulting in a lower internal energy and luminosity. Conversely, contraction is favored for plasmoids encountering an increasing background density.

COMMUNICATION OVER A QUANTUM CHANNEL WITH FEEDBACK. Ph.D. Thesis.
John Edward Kaufmann. 1980. 183 p.
Avail: Univ. Microfilms. Order No. 8015693.

The use of an ideal feedback channel was investigated in a quantum communication system where coherent signals were used and the transmitter was subject to an average energy constraints. The quantum system corresponding to the optical field arriving at the receiver was assumed to be in a pure state. Binary message sequences were transmitted and the receiver employs a sequential detection strategy where bit-by-bit measurements were made, one corresponding to each symbol of the transmitted sequence. The measurement performed at each step was allowed to change, where the choice was determined by the message source statistics and the previous decisions made by the receiver. The forward channel was assumed to be noise free so that performance was limited only by quantum effects at the receiver.

THEORETICAL AND EXPERIMENTAL STUDY OF THE CHARACTERISTICS OF A THIN CIRCULAR LOOP ANTENNA ABOVE A HOMOGENEOUS, DISSIPATIVE HALF-SPACE.
Ahmed Saad Abulkassem. 1980. 204 p.
Avail: Univ. Microfilms. Order No. 8011261.

The problem of two parallel, staggered loop antennas of the same radius located in free space was investigated. Current distributions on the two loops were obtained by solving two coupled integral equations simultaneously using the well-known Fourier series expansion technique. It is found that when the separation between the two loops is large compared to the radius of the wire loops, the coupling between the two coaxial resonant loops is generally much stronger than that between two coplanar loops. It is also found that the change in input conductance, which sometimes can be as large as 60 percent of the value of the input conductance of an isolated antenna, occurs usually when the separation of the two coaxial loops are close to integer multiples of wavelength. Proximity effects not only change the overall amplitudes of the currents on the loops, but the distribution of the currents as well.

INFRARED STUDY OF HYDROGEN CHEMISORBED ON W(100) BY SURFACE ELECTROMAGNETIC WAVE SPECTROSCOPY. Ph.D. Thesis.
Yves Jean Chabal. 1980. 209 p.
Avail: Univ. Microfilms. Order No. 8015651.

The first high resolution measurements of the v sub 1 vibrational mode of hydrogen chemisorbed on W(100) have been made using an infrared technique. The technique utilized the properties of inhomogeneous surface electromagnetic waves (SEW's) which propagated for several centimeters along a metal surface for wavelengths in the 10 micron region. Two methods for exciting SEW's on a metal surface were investigated. It was found that broadband SEW's could be generated by bombarding the surface with low energy electrons (approximately 100 eV), but the yield was too small to allow spectroscopic studies. A coupling geometry based on the principle of total internal reflection was devised to convert bulk radiation from a laser beam into

SEW's. This edge coupler was shown to be more efficient and more convenient than the usual two prism coupler or the grating coupler. With this coupler, the sensitivity of SEW's to monolayer coverages of molecules on metal surfaces was tested by studying the internal modes of KReO4 and SF6 physisorbed on gold films. Dissert. Abstr.

FOCAL AXIS RESOLVER FOR OFFSET REFLECTOR ANTENNAS
R. F. Schmidt. May 1980. 36 p. refs.
(NASA-TM-80683) Avail: NTIS HC A03/MF A01 CSCL 09C

Described are electrical means for determining the focal axis of an offset reflector antenna whose physical rim is not coincident with the boundary of the electrical aperture. Even and odd sensing functions are employed in the focal region, leading to both amplitude and phase criteria for resolving a focal axis generally inclined with respect to the system axis. The analytical aspects of the problem are discussed, and an example related to a 4-meter Large-Antenna Multiple-Frequency Microwave Radiometer (LAMMR) is included. The technique is useful for focal axis determination in mathematical simulations and in the physical world. Author

COMPUTER PREDICTION OF LARGE REFLECTOR ANTENNA RADIATION PROPERTIES
Alan Botula. Jul. 1980. 169 p. refs.
(Grant NsG-1588)
(NASA-CR-163253) Avail: NTIS HC A08/MF A01 CSCL 17I

A FORTRAN program for calculating reflector antenna radiation patterns was rewritten and extended to include reflectors composed of a number of panels. These individual panels must be analytic surfaces. The theoretical foundation for the program is as follows. Geometrical optics techniques are used to trace rays from a feed antenna to the reflector surface and back to a mathematical plane just in front of the reflector. The resulting tangential electric field distribution, assumed to be the only source of forward radiation, is integrated numerically to calculate the radiation pattern for a desired set of angles. When the reflector is composed of more than one panel, each panel is treated as a separated antenna, the ray-tracing procedure and integration being repeated for each panel. The results of the individual aperture plane integrations are stored and summed to yield the relative electric field strength over the angles of interest. An example and several test cases are included to demonstrate the use of the program and verify the new method of computation. A.R.H.

A MICROPROCESSOR BASED HIGH SPEED PACKET SWITCH FOR SATELLITE COMMUNICATIONS. Final Report, 15 Apr. 1978 - 30 May 1980
Mohammed Arozullah and Stephen C. Crist. 30 May 1980. 347 p. refs.
(Grant NsG-3191)
(NASA-CR-163357) Avail: NTIS HC A15/MF A01 CSCL 17B

The architectures of a single processor, a three processor, and a multiple processor system are described. The hardware circuits, and software routines required for implementing the three and multiple processor designs are presented. A bit-slice microprocessor was designed and microprogrammed. Maximum throughput was calculated for all three designs. Queue theoretic models for these three designs were developed and utilized to obtain analytical expressions for the average waiting times, overall average response times and average queue sizes. From these expressions, graphs were obtained showing the effect on the system performance of a number of design parameters. A.R.H.

A MICROPROCESSOR BASED HIGH SPEED PACKET SWITCH FOR SATELLITE COMMUNICATIONS. EXECUTIVE SUMMARY Executive Summary Report, 15 Apr. 1978 - 30 May 1980
Mohammed Arozullah and Stephen C. Crist. 30 May 1980. 16 p. refs.
(Grant NsG-3191)
(NASA-CR-163357) Avail: NTIS HC A02/MF A01 CSCL 17B

The feasibility of using microprocessors to control satellite-borne packet switching was investigated by designing a packet switch architecture suitable for microprocessor control, using 2900 series components to design the processor(s), and evaluating the packet switch in terms of system throughput, delay, and queue sizes without the packet switch. System architecture for one, three, and multiple processors was designed and evaluated. The production cost of the single processor packet switch is estimated at $500,000, excluding cost of development. The three processor version which can support a maximum throughput of 500,000 packets/sec is estimated to have a production cost of under $100,000. For the multiple processor system, cost is believed to be proportional to throughput, with $1,000,000 for 500,000 packets/sec being the proportionality factor. A.R.H.

INFORMATION PROCESSING TECHNIQUES PROGRAM. VOLUME 1. PACKET SPEECH SYSTEMS TECHNOLOGY Semiannual Technical Summary Report, 1 Apr. - 30 Sep. 1979
Theodore Bially. 30 Sep. 1979. 40 p. refs.
(Contract F19628-78-C-0002; ARPA Order 2006)
(AD-A083195; ESD-TR-79-281) Avail: NTIS HC A03/MF A01 CSCL 17/2

The current program has two major thrusts; i.e., the development and refinement of practical low-cost, robust, narrowband and variable-rate speech algorithms and voice terminal structures, and the establishment of an experimental wideband satellite network to serve as a unique facility for the realistic investigation of voice/data networking strategies. This report covers work in the following areas: development of a custom-LSI-based narrowband channel vocoder; studies and real-time implementation of improved vocoder structures and algorithms; evaluation of speech processing capability of CCD-based spectrum analysis hardware; preparation of hardware and firmware for an upcoming speech algorithm test and evaluation program; design and implementation of packet voice terminals and local area access facilities; progress in satellite network and internetted packet voice conferencing and in the development of new packet voice network protocols; and design of a traffic emulation module for the wideband experimental network. ELECTROMAGNETIC SCATTERING PATTERNS FROM SINUSOIDAL SURFACES: VERTICAL POLARIZATION
R. H. Lang and A. K. Jordan. 17 Mar. 1980. 18 p. refs.
(AD-A083919; NRL-MR-4188) Avail: NTIS HC A02/MF A01 CSCL 20/14

In this paper we present an analysis and calculation of scattering patterns resulting from a vertically polarized beam of electromagnetic plane waves incident on a sinusoidal surface. This model is frequently used to study scattering from periodically rough surfaces. The horizontally polarized case is treated in a previous paper by the authors. The vector properties of this electromagnetic scattering problem are considered in this communication by extending the previous analysis to the vertically polarized case and comparing the scattering patterns for the two polarizations. FEEDBACK NULLING DEMONSTRATION SYSTEM HARDWARE
David A. Siegel, David M. Hodsdon, Bing M. Potts, Howard S. Babbitt, Ervin S. Davis, Warren K. Hutchinson, and Karen Leeds. 23 Nov. 1979. 108 p. refs.
(Contract F19628-80-C-0002; AF Proj. 2029)
(AD-A084013; TN-1979-12; ESD-TR-79-272) Avail: NTIS HC A06/MF A01 CSCL 17/4

As part of the technology development of anti-jam satellite communications, Lincoln Laboratory has developed, built, and tested a demonstration analog-feedback adaptive-nulling antenna

system. The system, which is based on the Howells-Applebaum feedback loop, is designed to increase the signal-to-interference ratio when desired signals operate in the presence of interference signals. The signals received from interfering or undesirable signal sources are minimized by appropriately modifying the antenna radiation pattern so as to attenuate signals from the direction of those sources relative to the desired signals. The demonstration system consists of a simulated array of antenna elements and uplink signals and a real-time adaptive receiver-processor which controls the weighting of each element signal prior to combining. The weighting process involves changing the relative amplitudes and phases of the received signals thus changing the effective receiving radiation pattern of the antenna, i.e., its relative response to signals arriving from different directions. The system operation involves taking the signals from N independent antenna elements and weighting and combining them to form a single output signal in which the signal-to-interference ratio is enhanced over what it is for any individual antenna element. The task of the nulling processor is to select the set of weights for the antenna element array in some optimum fashion. GRA

HIGH POWER HF AND NOISE CANCELLATION SYSTEM Final Technical Report, Oct. 1978 - Jan. 1980
Samuel J. Harris and Stephen J. Rosasco. Griffiss AFB, N.Y. RADC. Mar. 1980. 48 p. refs.
(Contract F30602-78-C-0338; AF Proj. 2338)
(AD-A084016; GAC-3392-3403-13; RADC-TR-80-56) Avail: NTIS. HC A03/MF A01. CSCL 20/14

The objectives of this effort were achieved and should permit high power HF (2-30 MHz) transmitters and conventional HF receivers to be collocated on an aircraft and operated simultaneously (full duplex) with appreciably less than 10% frequency separation between the transmit and receive channels. The option of frequency assignment between the Maximum Usable Frequency (MUF) and the Lowest Usable Frequency (LUF) for the transmit and receive frequencies can result in a 40 dB improvement in a duplex circuit, or stated another way, it may be the only way to establish a circuit between two points. One or more full duplex HF circuits can be operated simultaneously on an aircraft. The technique employed is a high power HF Interference Cancellation System which is adaptive and completely automatic. The significance of this effort is that it has direct application to C3 aircraft and collocated ground HF sites, including those sites with transmitters of ultra high power output (1 kW). In addition, the ultra linear high power weight/controller technology employing goniometers can be applied in any frequency range from VLF to UHF. GRA

INTERMEDIATE RESULTS OF THE RADAR BACKSCATTER STUDY OF SEA ICE IN THE BEAUFORT SEA
C. V. Delker, R. G. Onstott, and R. K. Moore. Mar. 1980. 48 p. refs.
(Contract N00014-76-C-1105)
(AD-A083644; RSL-TR-331-15) Avail: NTIS. HC A03/MF A01. CSCL 08/12

As a part of the Beaufort Sea segment of the Surveillance Satellite Project (SURSAT), a team of investigators from the University of Kansas conducted experiments to obtain quantitative measurements of radar backscatter from sea ice during the month of March 1979. Thick first-year sea ice, thin first-year sea ice, and an inland fresh water lake were studied using a surface-based FM-CW scatterometer that swept from 1.1 - 1.9 GHz and 8.5 - 17.5 GHz with angles of incidence (from vertical) of 10 deg. to 75 deg and various linear polarizations. Measurements of thick first-year sea ice, thin first-year sea ice, brackish sea ice, and an inland fresh-water lake were also made using a helicopter-borne FM-CW scatterometer that swept from 8.5 - 17.5 GHz with incidence angles of 20 deg. to 60 deg. and VV polarization only. The 1.1 - 1.9 GHz measurements show that lake ice can be distinguished from thick and thin first-year sea ice. The radar cross-sections of thick and thin first-year sea ice are not significantly different for incidence angles less than 45 deg. The 8.5 - 17.5 GHz measurements indicate that lake ice can be distinguished from the other types in all cases. Thick and thin first-year sea ice are separated by a 2 - 4 dB difference for incidence angles greater than 40 deg. The effect of snow cover on the return from lake ice was also investigated with dramatic results. GRA

RESONANCES OF RADAR TARGETS AND TARGET DISCRIMINATION Final Report, 6 Mar. 1979 - 5 Mar. 1980
Herbert Uberall. Mar. 1980. 45 p. refs.
(Contract N00019-79-C-0270)
(AD-A083680) Avail: NTIS. HC A03/MF A01. CSCL 17/9

The topic of the research program covers methods for target discrimination by radar scattering, making use of the natural resonances of the targets. The general plan of the program consists in a study of resonances of targets of simple shape (e.g., sphere) but complex composition (e.g., dielectric coating of conductors) during the first year, followed by simple conducting targets and comparison with parallel measurements performed at NSWC Dahlgren in the second year, with further extension to conductors of more complex shapes, using Waterman's methods, later on. The emphasis of our study is two-fold, namely: (1) to study ways how the resonance structure of the radar echo can be used for identifying the nature of the target (the 'inverse scattering problem'); and (2) to obtain a physical understanding of the phenomena that cause the resonances, and how they manifest themselves in both steady-state and pulsed echoes. Such an understanding, in preference to a more mechanical use of the singularity expansion method, will provide us with the true capability of mastering the target discrimination problem. GRA

BACKSCATTERING OF ELECTROMAGNETIC WAVES FROM A LAYER OF VEGETATION
Richard A. Hevenor. 15 Feb. 1980. 29 p. refs.
(AD-A083922; ETL-R008) Avail: NTIS. HC A03/MF A01. CSCL 17/9

A theoretical model for the backscattering of electromagnetic waves from a layer of vegetation is computed using a first order renormalization technique to determine volume scattering. The vegetation soil interface is assumed rough according to the tangent plane approximation and the scattering from this boundary is added incoherently to the volume scattering result. The mean wave in the vegetation is obtained using a bilocal approximation of the Dyson's equation. A free space dyadic Green's function is used along with a correlation function of the dielectric fluctuations which is exponential in form and which also possess different correlation lengths lx, ly, and lz in the x, y, and z, directions. Effective propagation constants are obtained for both horizontal and vertical polarizations. The scattered wave is solved for using a two dimensional Fourier transform technique and the boundary conditions at either end of the vegetation layer are matched. The far field backscatter coefficients are computed for both horizontal and vertical polarizations. The mean and variance of the dielectric fluctuations are calculated with the aid of Peake's model for the dielectric constant of vegetation. The theory is matched to experimental data taken from a corn field. The resulting values for the correlation parameters are then used to monitor the growth pattern of the corn field over a period of time. Comparison between the theoretical and experimental results over this time period are shown. The theory is also matched to experimental data from spring and fall deciduous trees. GRA

EFFECT OF VARIOUS DIELECTRICS ON THE DESIGN OF MILLIMETER-WAVE LINE SCANNING ANTENNAS
Kenneth L. Klohn. Nov. 1979. 26 p. refs.
(DA Proj. 1L1-62705-AH-94)
(AD-A083791; DELET-TR-79-24) Avail: NTIS. HC A03/MF A01. CSCL 09/5

The effect of using various materials having different relative dielectric constants on the theoretical design of millimeter-wave

line scanning antennas has been examined. Three typical dielectrics were chosen for comparative purposes; silicon (epsilon(r) = 12, sapphire (epsilon(r) = 9.4), and boron nitride (Epsilon(r) = 4). Theoretical calculations were made for each material over the frequency range of 60 to 220 GHz, with special emphasis at 94 GHz due to its increasing use in new millimeter-wave systems. Comparisons were made among the dielectric materials in regard to their maximum allowable physical size for single E(y) 11 mode operation. Using each of the three dielectrics with periodic surface perturbations as a line scanning antenna, the effects on the angle of radiating energy due to changes in the waveguide size and perturbation spacing were determined and evaluated. DEVELOPMENT OF AN AUTOMATED REMOTE COMMUNICATIONS AIR-GROUND (RCAG) MONITORING SYSTEM Final Report, Mar. 1978 - May 1979
Nicholas J. Talotta and Albert J. Rehmann Apr. 1980 192 p refs
(AD-A083754; FAA-NA-79-44; FAA-RD-79-125) Avail: NTIS HC A09/MF A01 CSCL 14/2

A monitoring System for remote communication air-ground (RCAG) facility equipment was developed, including the design and fabrication of an engineering model. Sensor techniques for the transmitters and receivers were investigated. The design made use of a microprocessor with associated hardware and software to 'continuously monitor' critical parameters. Certification data and/or alarms were reported via a terminal. It is concluded that production of automated monitoring equipment for Federal Aviation Administration (FAA) air/ground communication facilities with the specific sensor techniques, processing, and control used in this experimentation is feasible. THEORETICAL FEASIBILITY OF DIGITAL COMMUNICATION OVER OCEAN AREAS BY HIGH FREQUENCY RADIO Final Report, Aug. 1978 - Jul. 1979
George W. Haydon, Charles M. Rush, and Larry R. Teters Nov. 1979 89 p refs Prepared in cooperation with the National Telecommunication Information Admin., Boulder, Colo.
(AD-A079424; TSC-FAA-79-26; FAA-EM-78-20) Avail: NTIS HC A05/MF A01 CSCL 17/2

The theoretical reliability of digital data transmission via high-frequency radio is examined for typical air traffic routes in the Atlantic and Pacific areas to assist the U.S. Department of Transportation in the evaluation of a system for improving air traffic control over ocean areas. The expected performance of a reference high-frequency data transmission system of 1200 bits per second with a permissible error rate of one in a thousand binary error is expressed as a percentage of time that a given theoretical reliability will be equaled or exceeded. The expected performance of air-to-air HF systems is also considered, and it is concluded that these systems should work for the reference communication system out to the line-of-sight range of about 800 km for high-flying aircraft. THEORETICAL STUDIES OF MICROSTRIP ANTENNAS. VOLUME 2: ANALYSIS AND SYNTHESIS OF MULTI-FREQUENCY ELEMENTS Final Report, Apr. 1978 - Jul. 1979
Frederic R. Morgenthaler Sep. 1979 50 p
(Contract DOT-TSC-15364)
(AD-A075540; TSC-FAA-79-21-2; FAA-EM-79-11-2) Avail: NTIS HC A03/MF A01 CSCL 09/5

Volume 2 of Theoretical Studies of Microstrip Antennas deals with the analysis and synthesis of several types of novel multi-resonant elements with emphasis on dual-frequency operation of rectangular microstrip patch antennas with or without external matching networks. Specifically, we analyze dual resonances created within a single rectangular patch by means of appropriate dielectric loading and also those associated with a patch capacitively-coupled to either a lumped or distributed matching network. In all cases radiation is obtained from slots in the rectangular patch in combination with open-circuited edges. Rather than separately design the dual-resonating elements and matching networks and hope for efficient radiation and proper patterns at both frequencies, we favor and herein pursue an integrated synthesis which demands simultaneous fulfillment of the design goals. A synthesis approach, based upon coupled resonator theory, is also developed and applied to situations in which one resonant element is a rectangular microstrip patch and the second element either a second patch or else a lumped or distributed matching network. Based upon these considerations, several new antenna configurations are proposed that utilize either in line or stacked element geometries. Volume I of this report deals with general design techniques and analyses of single and coupled microstrip radiating elements. GRA

(Contract F30602-79-C-0011; AF Proj. 2338)
(AD-A084352; RADC-TR-80-59) Avail: NTIS HC A07/MF A01 CSCL 09/2

Three computer programs are presented for the analysis of electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness. The first and second programs utilize a non-modal and model formulation, respectively, which are derived in detail in an earlier report. Some approximate solutions are available when the slit cross section is a rectangular shape and these are investigated in the third program. The programs are all written in FORTRAN IV language. Quantities computed are equivalent electric and magnetic currents on the contour defining the slit cross section, transmission coefficients, gain patterns, and normalized field patterns. Sample input and output data are presented for each program. Detailed instructions concerning the use of each program and its capabilities are given. GRA

Field-aligned radar backscatter echoes have been obtained from the equatorial F region using frequencies from slightly above the plasma frequency to as high as 415 MHz. In this report we study the possibility that such echoes result from steep transitions from low- to high-density plasmas. We have studied four profile forms for this transition. The first, the only physically based profile, is assumed to be associated with the gyroradius distribution of the ions in the plasma. The second profile, the Epstein profile, is subject to exact reflectivity analysis and is used to provide guidance concerning the accuracy of the Born approximation used in our other calculations. The third profile, a half Gaussian wedded to a step function, a form used by Balsley and Farley, and a fourth profile, a raised cosine form, lead to very intense scattering, by hundreds of dBs, compared with that derived from our physically based gyroradius distribution. We believe we have shown that the intense scattering results computed by Balsley and Farley are due to mathematical discontinuities in the second derivatives of these last two profiles. As a result, we argue that the half-Gaussian profile is an inappropriate, unphysical model, and results based upon this model are probably unrealistic. GRA

STATISTICAL BEHAVIOR OF SIGNALS FROM THE WIDEBAND SIGNAL Final Report, 15 Nov. 1977 - 31 Dec. 1978
Edward J. Fremouw 31 Dec. 1978 59 p refs
(Contract DNA001-78-C-0042)
(AD-A084646; AD-E300759; PD-NW-79-193R; DNA-4818f) Avail: NTIS HC A04/MF A01 CSCL 20/14

Optical and radio signals that have been scattered by random

refractive-index structure must be described statistically in systems-oriented codes and other applications. The general nature of the statistics that would best describe such signals has been an open question for some time, with different models being used close to the medium (log-normal) and far from it (Rician). Signal behavior in the intermediate zone, which is the relevant distance regime for radiowave communication through the structured ionosphere and through striated, high-altitude nuclear plasmas, has been difficult to characterize in a general and systematic way. The Wideband satellite experiment, with its multiple, coherent frequencies and its variety of observing geometries, has provided a wealth of data upon which to base a general model. In this work, careful and detailed analysis has been performed of VHF, UHF, and L-band data from the Wideband receiving stations at Ancon, Kwajalein, Stanford, and Poker Flat to establish the statistical behavior of scattered signals over a wide range of scattering strength, Fresnel-zone size (which sets the effective distance), and scattering geometry. Histograms of intensity and phase were compared, by means of chi-square testing, with probability density functions derived from four leading signal-statistical hypotheses: log-normal; generalized Gaussian, of which Rice statistics are a special case; two-component, which invokes the log-normal and generalized Gaussian hypotheses in different regimes of the signal fluctuation spectrum; and Nakagami-m, which is an approximation to generalized Gaussian statistics addressing only the behavior of signal intensity. (AD-A084345; ESL-784641-2) Avail: NTIS
HC A07/MF A01 CSCL 20/14

This report deals with an asymptotic high frequency analysis of the radiation patterns of a magnetic line source, or a magnetic line dipole, located on a uniform impedance surface patch which partly covers an electrically large perfectly conducting convex cylinder. This work is relevant, for example, to the analysis of fuselage mounted airborne antennas for satellite communication purposes. In the latter application impedance surface patches may be employed to increase the radiation intensity near the horizon over that which would ordinarily exist in the absence of any such impedance loading. In the present analysis, the impedance surface patch is represented as an equivalent aperture in the rest of the perfectly conducting convex cylinder. Approximate asymptotic expressions for the (equivalent aperture distribution); i.e., for the (currents on the impedance surface patch) are developed in this work for the two source types; these expressions for the currents are valid in the neighborhood of the source. The radiation pattern of this configuration is then found in a straightforward manner by numerically integrating this current distribution in conjunction with a simple and accurate asymptotic high frequency form of the perfectly conducting, convex cylinder Green's function. Radiation pattern calculations based on this analysis are found to compare quite well with a numerical moment method type solution, a previous GTD solution for those impedances which support an Elliot mode, and also with some presently available experimental results. COMPARISON OF AN ALPHA-BETA AND KALMAN FILTER IN TRACK WHILE SCAN RADARS M.S. Thesis
Dimitrios Emmanuel Mayiatis Dec. 1979 153 p refs
(AD-A084464) Avail: NTIS HC A08/MF A01 CSCL 17/9

The efficient use of a search-surface radar or sonar, in which one or more targets appear on the screen intermittently usually demands a device for tracking the targets automatically. Such a device, called a track while scan system, must make an estimate of each target's instantaneous position from the sampled-data information provided by the radar. For this purpose, an alpha-beta filter and an optimal Kalman filter, that must track maneuvering targets, are analyzed here and compared in terms of tracking accuracy for tactical application. GRA

ELECTROMAGNETIC SCATTERING BY SURFACES OF ARBITRARY SHAPE
Donald R. Wilton, S. S. M. Rao, and Allen W. Glisson Griffiss AFB, N.Y. RADC Mar. 1980 69 p refs
(Contract F30602-78-C-0148; AF Proj. 2338)
(AD-A084347; RADC-TR-79-325) Avail: NTIS HC A04/MF A01 CSCL 20/14

The electric field integral equation (EFIE) is used with the moment method to develop a simple and efficient numerical procedure for treating problems of scattering by arbitrarily-shaped objects. The objects are modeled for numerical purposes by planar triangular surface patch models. Because the EFIE formulation is used, the procedure is applicable to both open and closed bodies. Crucial to the formulation is the development of a set of special subdomain basis functions defined on pairs of adjacent triangular patches. The basis functions yield a current representation which is free of line or point charges at subdomain boundaries. A second approach using the magnetic field integral equation (MFIE) and employing the same basis functions is also developed. Although the MFIE applies only to closed bodies, the moment matrix of the MFIE is also needed in dielectric scattering problems and in the so-called combined field integral equation used to eliminate difficulties with internal resonances present in the MFIE and EFIE formulations. The EFIE approach is applied to the scattering problems of plane wave illumination of a flat square plate, a bent square plate, a circular disk, and a sphere. Comparisons of surface current densities are made with previous computations or exact formulations and good agreement is obtained in each case. The MFIE approach is also applied to the sphere and reasonable agreement with exact calculations is obtained. GRA

ADAPTIVE TECHNIQUES FOR LARGE SPACE APERTURES Final Technical Report, 6 Nov. 1978 - 5 Nov. 1979
R. J. Richardson, John Coyner, Alan Fenn, and Al Brook Griffiss AFB, N.Y. RADC Mar. 1980 329 p refs
(Contract F30602-79-C-0017; AF Proj. 4506)
(AD-A084631; RADC-TR-80-52) Avail: NTIS HC A15/MF A01 CSCL 17/9

Two missions which utilize large space apertures were considered on the program. These were the space-based radar mission (SBR) and the space-based millimeter-wave radiometer mission (MWR). The greater part of the effort was spent on the radar mission. The intent of the program was to investigate reflector-based alternates to the space-fed phased array system that is the current baseline for the space-based radar program. The three major tasks on the program were Task 1, Concept Development/Assessment; Task 2, Performance Analysis, Selected Approach; and Task 3, Specific Mission Designs. The adaptive techniques of interest were those that might be required to compensate for surface irregularities in the large, space-deployable reflectors that would be required for these missions. This and other system requirements were considered in selecting an antenna system for each mission. GRA

This study assessed the applicability of three area-based change-detection algorithms to the problem of recognizing differences between two images. These approaches are based on defining sets of descriptors for small regions of each scene and then comparing these sets of descriptors to indicate areas of change. The first algorithm is based on the phase-correlation concept, a technique for extracting accurate estimates of the relative displacement of two images from the phase of their cross-power spectrum. The 2nd is based on using a subset of power-spectral coefficients for each image; the subset is chosen to minimize differences due to scene bias, shading, or high-frequency noise content. The 3rd is based on defining image moments and a set of functions of these moments which are invariant with respect to a number of geometrical distortion or scale changes of the image. These algorithms were applied to furnished SAR images. Results of the three algorithms are consistent among themselves but correlate weakly with known ground truth. Studies to determine the size of targets that can be reliably detected by use of these methods indicate that the size of targets in the furnished images fails to meet the size criterion for reliable change detection. It is concluded that, for imagery of this quality and resolution, target detection and association algorithms should prove to be more effective for change detection. GRA

LORAN-C SIGNAL ANALYSIS PROPAGATION MODEL EVALUATION Final Report, Jun. 1977 - May 1978
Burt Gambill and Kenneth Schwartz Jul. 1979 228 p refs
(Contract DOT-CG-64810-A)
(AD-A084338; GE78TMP-51; USCG-D-20-80) Avail: NTIS HC A11/MF A01 CSCL 20/14

This report compares predictions of groundwave propagation time with experimental values. The prediction methods included an integral equation technique that accounts for both terrain and impedance variations, a method developed by J.R. Wait that accounts for impedance variations, and Millington's or Pressey's technique that accounts for inhomogeneous impedance. Experimental incremental time-of-arrival data were acquired between eight sites along a propagation path from Search-light, NV. to Ft. Cronkhite (near San Francisco Bay). The major conclusions reached from the analysis and comparison of results are: terrain variations produce significant local and cumulative phase variations, in this case, a cumulative large increase in total secondary phase; impedance values need to be known to within less than a factor of two to be sufficient for preparing charts for navigation in restricted waterways; a priori definition of terrain variation can be performed with required accuracy - a priori definition of surface impedance values with sufficient accuracy is unlikely without supporting measurements; and a combination of predictions and measurements is required for accurate chart preparation. Predictions can be used to define appropriate measurement locations and to interpolate between measurement values. GRA

HF DIRECTION FINDING BY WATERFRONT TESTING
D. W. Rice Mar. 1980 47 p refs
(AD-A084549; CRC-1333) Avail: NTIS HC A03/MF A01 CSCL 17/3

Calculations are reported of the probability of observation of various degrees of phase-front non-linearity for two and three signals incident from different directions upon a phase-measuring array. It is assumed that the signals fade independently, and that their amplitude probability densities are described by a Rayleigh law. It is shown that, under the worst-case conditions of equal powers in the signals, the probability of observing an rms phase deviation of 25 degrees or less from the best-fit straight line to the phase along an array, is about 0.5 when 2 rays are present, and about 0.2 when 3 rays are present. Experimental measurements over a 911km mid-latitude path and a 2100km trans-auroral-zone path, confirm the general behavior predicted by the theory. It is well known that amplitude fading can be attributed to various ionospheric effects; however the measurements show that modulation imposed on the signal at the transmitter can also play an important part in decorrelating the amplitudes of signals received (after different time delays) via different ionospheric modes. In the latter case, the modulation can markedly reduce both the waiting time between phase-linear events, and their duration. The experimental program included concurrent measurements over the same path using FMCW, CW and SSB signals from a co-operative transmission. GRA

QUIET RADAR PROCESSOR ANALYSIS BY COVARIANCE MATRIX TRANSFORMATIONS

Neal B. Lawrence Oct. 1979 53 p refs
(AD-A084453; DRSMI/RE-80-4) Avail: NTIS
HC A04/MF A01 CSCL 17/9

The MICOM Quiet Radar program is a multi-year exploratory development effort to build and test a short-range air-defense system radar with Anti-Radiation Missile (ARM) immunity. By transmitting a low-power, bi-phase modulated, continuous-wave waveform in conjunction with ultra-low sidelobes antenna and a frequency-agile carrier frequency, it is possible to reduce ARM lock-on capabilities to ineffective ranges. The objective of this effort was to determine probability of detection for a given false alarm rate for a candidate Quiet Radar processor by performing covariance matrix transformations. The analysis included range cell averaging CFAR. Results were obtained for two possible configurations of the Quiet Radar processor. The results are given as plots where the probability of detection in each frequency cell is shown for various probabilities of false alarm and CFAR range cell window widths. The analysis has verified previously determined CFAR losses and shown that processor performance is dependent on the low pass filter used for noise reduction. GRA

HC A04/MF A01 CSCL 20/14

In this work, the exterior-interior coupling problem of a cavity backed aperture in a perfectly conducting infinite sheet is considered. The cavity is assumed to be rectangular and contains a perfectly conducting obstacle. For numerical considerations the obstacle is taken to be a straight, thin wire, oriented perpendicular to one of the cavity walls. The problem is formulated in the frequency domain with an e(to the i omega tau power) time dependence. The dyadic formulation of this vector electromagnetic boundary value problem is given. The controversy over the longitudinal wave functions and their contribution to field dyads is resolved. Specific attention is given to the singularities and completeness of the Green's dyads: eigenfunction expansions. Numerically tractable integral equations for the aperture electric fields and the wire currents are obtained. A summation method is developed for evaluation of otherwise slowly converging eigenfunction expansions of potentials dyads when source and observation points become close. The numerical reduction of the integral equations by the method of moments is described. The numerical results for the aperture fields and the wire currents disclose a minus sign discrepancy between the results and previous results of Seidel. A discussion is given which supports the sign in the present work. GRA

HC A10/MF A01 CSCL 20/14

A model is developed for the effect of foliage on the average or coherent field propagating in the foliage and parallel to the foliage-air or foliage-ground interfaces. The model is based upon a number of assumptions which considerably reduce its complexity to the point where it can be used by systems designers in evaluating the effect of foliage on Synthetic Aperture Radars operating near grazing incidence. The model is hypothesized to be valid in the frequency range of about 0.1 to 1.5 GHz for deciduous trees and from 0.1 to about 3 GHz for needle bearing trees. Comparisons with available measurements indicate a surprisingly high degree of agreement considering the simplicity of the model. Suggestions for future analytical and experimental efforts are presented. GRA

HC A03/MF A01 CSCL 09/4

Spread spectrum signals require several kinds of processing. First, the effects of tracking error, Doppler shifts, etc. must be compensated out or ignored in some clever way to give the 'raw' signal. Second, the raw signal at high bandwidth must be decoded to give the low bandwidth information stream. Often this requires comparison of the raw signal with a properly synchronized pseudo random reference signal. Third, the low bandwidth signal may or may not be burst error correction coded and hence require appropriate decoding. In this study we found that all three steps in spread spectrum decoding could be approached optically. Specific, stand-alone developments from this program were two in number. First we developed a 'generalized matched filter' which can be used just as a matched filter but which out performs the matched filter in several important ways. Second, we developed a way of obtaining a high spectral resolution tunable acousto-optic filter using existing components. Both developments should find wide application outside spread spectrum decoding. GRA

DIGITAL TRANSMISSION EXPERIMENT OVER CTS (COMMUNICATION TECHNOLOGY SATELLITE) AUDIO CHANNELS Final Report
Samuel Yep and Surachai Suthasinekul Jul. 1979 70 p refs
(PB80-159544; LHNCBC-79-14) Avail: NTIS
HC A04/MF A01 CSCL 17B

An experiment is reported involving digital data transmission over a PHS/CTS (Public Health Service/Communications Technology Satellite) audio baseband channel. Since it is desired to evaluate the performance of the existing system from a digital data transmission standpoint, the interface between the digital subsystem and the audio channel is made at the baseband, thereby avoiding major modifications of the existing facilities. A two-level polar baseband signalling technique is employed which, besides being simple to implement, provides the flexibility for experimenting with various data rates. Experimental results indicate that digital transmission with a bandwidth efficiency of 2 bits per cycle for a 0.0001 bit error rate requires an S/N of about 13 dB, approximately 2 dB higher than the theoretical requirement. Possible causes for the degradation are suggested. It is recognized that since the S/N available in the audio baseband channel is much higher than 13 dB, this excess S/N could be exploited by using a multilevel technique to achieve a higher bandwidth efficiency or equivalently, a higher data rate. THE THEORY AND EFFECTS OF NEGLECTING STATOR AND NETWORK TRANSIENTS Ph.D. Thesis
Timothy Lyall Skvarenina 1979 154 p
Avail: Univ. Microfilms Order No. 8015519

The reduced order linearized equations of the induction machine are derived. Analytical results are developed to show that a ratio of machine parameters may be used as an indication of the accuracy of the eigenvalues predicted by the reduced order model. Large excursion studies of induction machines are presented and the accuracy of the results is shown to be dependent upon the machine parameters and type of study when the stator transients are neglected. Results are presented which show that it is not generally acceptable to neglect the stator and network transients when turbine generator shaft torques are of interest. It is shown that the magnitude of shaft torques resulting from faults in the system is very dependent upon the impedance between the machine and the point of the fault. A method is developed to allow the use of a modified standard transient stability program for the calculation of shaft torques.

MODELING AND ANALYSIS OF SWITCHED INTERCONNECTION NETWORKS Ph.D. Thesis
Petre Nichifor Turcu 1979 108 p
Avail: Univ. Microfilms Order No. 8012201

A traffic flow model was developed for the analysis of interconnection networks used in a circuit switched communications system. Using this model, rectangular banyan networks are analyzed. It is shown that, considering the number of component switches, rectangular banyan networks have a relatively large number of paths available to satisfy requests for communication. A graphical technique, is introduced to describe the synthesis and growth of balanced banyan networks for large traffic flows. This technique also provides insight into the size of the area and the number of levels necessary for two-dimensional implementations of balanced banyan networks. A two-dimensional implementation model for networks built out of 2 input, 2 output ports switches was developed and used to characterize the area occupied by crossbar and rectangular banyan networks when realized as VLSI circuits. The area occupied by these networks and the traffic flow values under one-to-one request functions are synthesized in an overall performance measure which allows us to compare crossbar networks and rectangular banyan networks. It is shown that for conservative designs crossbar networks are preferable to rectangular banyan networks. Dissert. Abstr.

TRANSIENT STABILITY ANALYSIS OF ac-dc POWER SYSTEMS Ph.D. Thesis
Asrat Teshome 1980 155 p
Avail: Univ. Microfilms Order No. 8015744

A non-linear model of a combined high-voltage ac-dc power system was digitally simulated. The model is used for the study and prediction of the effects of transient interactions between a high-voltage-direct-current (HVDC) transmission line and turbine-generator-shaft torsional behavior when the system is subjected to large disturbances. Improvement of a-c line loadability due to the stabilizing influence of a HVDC link was also examined. Turbine-generator torsional interaction studies were based on subsynchronous phenomena requiring an evaluation of the frequency, magnitude and decay of the subsynchronous currents in the ac-dc system following major system disturbances. The complex waveform of subsynchronous current, obtained by digital simulation, was analyzed using the Fast Fourier Transform technique. Results demonstrate that a HVDC link can affect the incidence of turbine-generator torsionals, can significantly improve the stability of the system in general and can be used to effect increased loadability of the a-c lines. Dissert. Abstr.

PARTICLE SIZE EFFECTS ON ELECTRICAL PROPERTIES OF THICK FILM RESISTORS Ph.D. Thesis
Ching-Tzuen Tarn 1979 155 p
Avail: Univ. Microfilms Order No. 8015527

Resistors were made with varying combinations of glass and RuO2 particle sizes at varying weight percents of RuO2. Spherical glass particles were used in order to eliminate any possible particle shape defect. The sizes of glass and RuO2 powders were determined with the scanning electron microscope and nitrogen adsorption surface area measurement. In making resistors, special care was taken to throughly blend the resistor pastes so that the blending factor was removed or reduced to a minimum. Different firing temperatures and times were used to fire resistors in an attempt to find a single firing condition that would make all resistors in their optimum sintered regions where optimum conducting chains were formed. The optimum single firing condition could not be found, and compromise conditions were chosen. Resistivities and temperature coefficients of resistance were measured, blending curves were plotted, and the critical conductive volume percents V sub mc's were obtained for plots of log G vs. log (V sub m-V sub mc)/G and V sub m being the conductivity and conductive volume percent respectively).
Dissert. Abstr.

MUTUAL COUPLING BETWEEN DIPOLES AND SLOTS IN THE PRESENCE OF GROUNDED DIELECTRIC SLABS Ph.D. Thesis
Isaac Khan Tasinga 1980 166 p
Avail: Univ. Microfilms Order No. 8016053

The mutual impedance between slender microstrip dipoles and the mutual admittance between narrow slots which are covered by a dielectric layer are calculated by using a combination of analytical and numerical methods. The basis of the analysis is a conformal transformation which facilitates function theoretic manipulations in the complex plane. This analysis leads to the determination of an integration path along which Sommerfeld integrals converge exponentially. The limits of applicability of this method are discussed. Results for different dielectric materials and substrate thicknesses for known resonant lengths are presented, and are in good agreement with results from other formulations. Results of mutual admittance calculations are presented for narrow slots. These computations are very efficient and are useful in the design of antenna arrays. Dissert. Abstr.

N80-27598 California Univ., Berkeley.
STOCHASTIC INTEGRATION, MARKOV PROPERTY AND MEASURE TRANSFORMATION OF RANDOM FIELDS

Ph.D. Thesis
Bruce Edward Hajek 1979 89 p
Avail: Univ. Microfilms Order No. 8014716

Classes of continuous parameter random fields with Markov properties or stochastic integral representations and random fields arising by absolutely continuous measure transformation were identified and studied. Specific emphasis is given to the central role of Markov properties, innovation representations, and measure transformations in nonlinear recursive estimation for multiple parameter random processes. Dissert. Abstr.

IC KU-BAND IMPATT AMPLIFIER Final Report, 1 Jun. 1977 - 31 Jan. 1979
V. Sokolov, M. R. Namordi, F. H. Doerbeck, and W. R. Wisseman Mar. 1979 111 p refs
(Contract NAS5-24182)
(NASA-CR-160004) Avail: NTIS HC A06/MF A01 CSCL 09A

High efficiency GaAs low-high-low IMPATTs were investigated. Theoretical analyses were employed to establish a design window for the material parameters to maximize microwave performance. Single mesa devices yielded typically 2 to 3 W with 16 to 23% efficiency in waveguide oscillator test circuits. IMPATTs with high reliability Pt/TiW/Pt/Au metallizations were subjected to temperature stress, non-rf bias-temperature stress, and rf bias-temperature stress. Assuming that temperature is the driving force behind the dominant failure mechanism, a mean-time-to-failure considerably greater than 500,000 hours is indicated by the stress tests. A 15 GHz, 4W, 56 dB gain microstrip amplifier was realized using GaAs FETs and IMPATTs. Power combining using a 3 db Lange coupler is employed in the power output stage having an intrinsic power-added efficiency of 15.7%. Overall dc-to-rf efficiency of the amplifier is 10.8%. The amplifier has greater than a 250 MHz, 1 db bandwidth; operates over the 0 deg to 50 C (base plate) temperature range with less than 0.5 db change in the power output; weighs 444 grams; and has a volume of 220 cu cm. NON-LINEAR JUNCTION CHARACTERIZATION
Myles R. McMillan May 1979 53 p refs In ENGLISH; FRENCH summary
(AD-A083898; DREO-TN-79-7) Avail: NTIS HC A04/MF A01 CSCL 09/1

The phenomena of non-linear junctions formed by contacting metal surfaces was investigated and a method to characterize these junctions is described. Normally linear components, such as points of contact, can become nonlinear elements. These can occur in coupling hardware of coaxial transmission lines, in flanged joints of wave guides and in other waveguide components that are bolted together. Chemical compounds build up on metal contact surfaces exposed to the atmosphere. The compounds, oxides and sulphides for example, are semiconductive and tend to increase contact resistance. They have a non-linear current-voltage characteristic that can be used to characterize Metal-Oxide-Metal junctions by non-linear measurements. When a pure sinusoidal current flows through a component (point of contact) the voltage across it is distorted by any nonlinearities present. The distorted voltage can be considered the sum of a fundamental frequency voltage and a number of voltages at harmonic frequencies. The magnitude of these harmonic voltages can serve as a measure of the nonlinearity present in the contact. For convenience, the third harmonic is usually chosen since it has the largest magnitude and therefore is easiest to measure. GRA

A COMPREHENSIVE REVIEW OF TRAVELLING WAVE TUBE TECHNOLOGY
Robert Luiz Nov. 1979 80 p refs
(AD-A083899; DREO-TN-80-1) Avail: NTIS HC A05/MF A01 CSCL 09/1

A review of TWT technology is presented comparing selected aspects and design procedures relative to application. The general theory of operation of various types of TWT designs is discussed together with a review of principles of their construction and trade offs. The travelling-wave tube (TWT) was invented by R. Kompfner in 1943, and the principle of TWT amplification was demonstrated by him at Birmingham University in the same year. A small signal theory of this device was extensively developed by J.R. Pierce. The TWT has been constructed to operate at many wavelengths, ranging from one meter to one millimetre. It has found wide application primarily because at any given frequency or power level, it offers much more bandwidth than any of its competitors. The travelling-wave tube, though structurally simple, is a 'Constructred Complication'. Because of its structural simplicity, TWTs have been built to operate at frequencies as high as 50 GHz. Modern requirements for TWT amplifiers often call for very wide bandwidths combined with high power output. For any practical application an ideal TWT is seldom available as an 'off-the-shelf' item mainly because more than two dozen independent parameters are required in order to completely describe the tube. GRA

THEORY AND DESIGN OF ELECTRICAL ROTATING MACHINERY Final Report, 1 May 1972 - 31 Oct. 1979
W. J. Carr, Jr. Apr. 1980 50 p refs
(Contract N00014-72-C-0432)
(AD-A083499) Avail: NTIS HC A03/MF A01 CSCL 09/3

The objective of this program was to contribute toward new and improved rotating machines for Naval applications, with emphasis on superconducting machinery. Work has been performed on the theory of ac losses in multifilament superconductors and experiments were made to check the theory. A list of publications and abstracts of scientific papers published under the contract is given, and a review is given of the theory of losses. A macroscopic theory for superconductivity in multifilament superconductors was developed, and the theory was used to calculate the hysteresis and eddy current losses which occur in the presence of changing magnetic fields. Both the transverse field and the longitudinal field cases were considered, and also the self-field loss of an alternating transport current, along with some examples of the combined loss due to alternating applied field and transport current. The results are useful for the design of superconducting devices, such as superconducting motors and generators. A small amount of additional work was done on studies of novel homo- and heteropolar motors. GRA

THE 140 GHz PULSED IMPATT COMBINER HIGH POWER SOURCE Final Report, 1 Jul. 1977 - 30 Nov. 1978
T. T. Fong, T. A. Midford, E. M. Nakaji, and Y. C. Ngan Jan. 1980 103 p refs
(Contract DAAK11-77-C-0040)
(AD-A083450; AD-E430384; HAC-W-42585; ARBRL-CR-00414) Avail: NTIS HC A06/MF A01 CSCL 09/1

The objective of this program was to develop silicon IMPATT diode and power combiner circuit technology in order to demonstrate improved pulse power generating capability at 140 GHz. The program efforts have led to significant advances in the state-of-the-art for pulsed solid state power generation IND-band. The diodes fabricated for this program were double drift IMPATT's with active regions formed by a combination of n-type epitaxial growth and multiple dose/energy p-type ion implants. Copper heat sinks were used. The most successful diode package configuration was a double quartz standoff configuration. The three types of power combining structures investigated were: (1) a resonant rectangular waveguide structure with center-mounted diodes; (2) a variation of 1, employing the coplanar biasing configuration; (3) a rectangular waveguide combiner with sidewall-mounted diodes Kurakowa circuit. The rectangular cavity with sidewall mounted diodes was by far the most successful. In this circuit, power from two pulsed diodes was combined with approximately 90% combining efficiency. High peak power output at 14 GHz was achieved for both single and multiple diode oscillators. Single diode peak power levels of 3.0 watts at 3% efficiency were obtained for a 100 ns pulse length and a 50 KHz pulse repetition frequency. A two-diode power combiner based on an oversize version of Kurakowa circuit was constructed which produced 3.0 watts of peak output power. Two high power pulsed sources complete with modulators were delivered to the Army. One of these sources is a single diode oscillator, the other a two diode power combiner oscillator. Both of these sources meet the program object of 3.0 watts of peak output power at pulse lengths of 50-100 ns. GRA

NONCOPLANAR HIGH POWER FET Final Report, Dec. 1974 - Nov. 1978
S. G. Bandy, D. M. Collins, D. R. Decker, J. H. Dully, R. D. Fairman, S. B. Hyder, C. K. Nischimoto, and R. Sahkaran Dec. 1979 138 p refs
(Contract N00014-76-C-0303; RF54581001)
(AD-A083682) Avail: NTIS HC A07/MF A01 CSCL 09/1

Using a p- substrate as the gate and employing low-doped V-grooves under the source and drain to reduce parasitic capacitances, a noncoplanar power FET was designed and fabricated which achieved submicron gate lengths with photolithography masks employing a resolution limit of several microns. Device performance was limited by low values of pinch-off voltage and gate breakdown voltage. Ion implantation or diffusion should enable the breakdown voltage to be raised by virtue of separating the p-n junction from the growth interface. GRA

CONTIGUOUS GRIDDED GUN DEVELOPMENT PROGRAM Final Technical Report, Mar. 1978 - Aug. 1979
Glen Huffman Griffiss AFB, N.Y. RADC Mar. 1980 33 p
(Contract F30602-78-C-0123; AF Proj. 4506)
(AD-A084046; RADC-TR-80-51) Avail: NTIS HC A03/MF A01 CSCL 09/1

A gridded gun, suitable for operating megawatt level linear beam tubes, has been designed and tested at lower levels in a beam analyzer. The new gun features a shadow grid in contact with the cathode surface. A major goal was to achieve low control grid interception. Guns with contiguous grid systems are in common use in low and medium power tubes. The purpose of this program was to extend existing lower power gridded gun technology to the megawatt level. The basic gun parameters including beam diameter, voltage, current, perveance and grid operating voltage are all quite conservative and readily achievable in an 83 kV gun. The most critical requirement was that the maximum outer diameter of the gun assembly not exceed 5.48 inches. This limit forced a compromise between cathode emission density and high voltage gradients and dictated the use of a tungsten matrix cathode. A scale model gun was built and tested in a beam analyzer. After modification to the design, a full-scale gun was built and also tested in the beam analyzer. Extrapolations from the beam analyzer test data show that the gun should meet all performance objectives at full power except for heater power and grid bias voltage. The intercepted control grid current cannot be accurately estimated for full power operation, but it is believed that it will be less than the 40 milliamps specified. GRA

PIEZOELECTRICITY IN NYLON 11
B. A. Newman, P. Chen, K. D. Pae, and J. I. Scheinbeim 1 Apr. 1980 19 p refs Submitted for publication
(Contract N00014-75-C-0540; NR Proj. 356-564)
(AD-A083719; TR-19) Avail: NTIS HC A02/MF A01 CSCL 11/9

At the present time only poled, crawn poly vinylidene fluoride PVF 2 films give evidence of sufficiently high piezoelectric response to be useful in device applications, and for this reason the great majority of research has centered around this polymer. As in the case of PVF 2, many of the odd nylons crystallize in a polar space group with a large net dipole moment in the unit cell. On the basis of the understanding now reached of the properties of poled PVF 2 films it would appear that the occ nylons have the potential to make films with high piezoelectric activity. Piezoelectricity and pyecelectricity in nylon 11 films have been studied previously and piezoelectric strain coefficients found were higher than most polymers but still two orders of magnitude less than the corresponding activity found in poled oriented PVF 2 d 31 approx. 20p C/N . Studies carried out in this laboratory have shown that by appropriate variation of poling conditions and sample microstructure quite large piezoelectric constants can be obtained for nylons 11 films d 31 approx. 3p C/N. The dependence of the piezoelectric strain constant d 31 on poling temperature, poling field and crystal structure will be discussed. GRA

ANALYSIS OF A TWO-FLUID EHD POWER GENERATOR INCLUDING EFFECTS OF COMPRESSIBILITY
T. H. Gawain and Oscar Biblarz Jan. 1980 94 p refs
(Contract ER-78-A-03-2122)
(AD-A084125; NPS67-80-002) Avail: NTIS HC A05/MF A01 CSCL 10/2

A detailed analysis and method of calculation is presented for determining the complete thermodynamic cycle of either a one-fluid or a two-fluid electrohydrodynamic (EHD) power generator. The analysis takes fully into account the compressibility of the media. Parameters are included which express the thermodynamic losses in the various components of the overall system. The severe restriction on output created by the electrical breakdown limit of the medium is clearly shown. The method for computing the net-electrical work output per unit mass of primary fluid and the net overall thermal efficiency of the system is carefully developed. The calculation procedure is illustrated by a completely worked out numerical example. The techniques presented here may be used to determine the performance

possibilities and limitations of various one-fluid and two-fluid EHD power generators. GRA

MODEL FOR THE READY DEFINITION AND APPROXIMATE COMPARISON OF ALTERNATIVE HIGH VOLTAGE TRANSMISSION SYSTEMS
Dec. 1978 183 p
(Contract ET-78-C-05-5916)
(DOE/ET-5916-1) Avail: NTIS HC A09/MF A01

A model of generic overhead transmission systems in the range of 362 to 1200 kV ac, and + or - 400 to + or - 800 kV dc is developed. Such generic systems are to include: (1) transmission from generation to load; and (2) interconnection of two large integrated systems, with and without the existence of an underlying, lower voltage network in either case. The model provides a means whereby an engineer with some experience in power systems planning can make a reconnaissance study of alternatives within a relatively short span of time and with fair accuracy. Given an amount of power to be transferred over a specified distance, the model is used: to define the workable alternatives in terms of voltages, number of lines, series compensation, and certain other factors affecting transfer capability; to delineate other salient features of the selected alternatives, notably shunt compensation requirements; and to compare the alternatives in terms of potentially relevent benefits and costs. The significant properties of the model, the basis and assumptions necessary to its formulation, instructions for its use, and inherent limitations upon the accuracy to be expected are described. SEMICONDUCTOR MEASUREMENT TECHNOLOGY: MODULATION MEASUREMENTS FOR MICROWAVE MIXERS Final Report, 1 Jan. 1970 - 31 Mar. 1974
James M. Kenney Feb. 1980 90 p refs Sponsored in part by Naval Electronic System Command
(PB80-166952; NBS-SP-400-16; LC-79-600161) Avail: NTIS HC A05/MF A01 CSCL 14B

The measurement of mixer conversion loss using periodic or incremental modulation of the local oscillator, and the evaluation and minimization of the associated systematic and random uncertainties, are discussed in terms of an X-band mixer measurement system. It is shown that the systematic uncertainty in the incremental modulation method of measuring conversion loss results largely from the uncertainties in the calibration of microwave attenuation and power. It is also shown that the modulation (periodic modulation) and incremental (incremental modulation) methods of measuring conversion loss are essentially identical, the only practical distinction being in the somewhat different instrumentation required by the different modulation rates. PREDICTOR-CORRECTOR METHODS FOR TIME DEPENDENT COMPRESSIBLE FLOWS Ph.D. Thesis
Keith Meintjes 1980 239 p
Avail: Univ. Microfilms Order No. 8015407

A general family of predictor-corrector finite difference methods, with application to problems in viscous, compressible fluid dynamics is considered. The generalization is sufficiently broad to include a number of known methods but still allows the necessary detailed analysis to be performed. Some properties are continuous functions of the generalizing parameters and may be optimized, while other characteristics are independent of these parameters and guaranteed a priori. It is shown analytically and numerically that the behavior of the computational solution of the Navier-Stokes equations at least for quasi one dimensional flow, is given by the study of Burgers' equation. SEPARATION EFFECTS IN GAS-PARTICLE FLOWS AT HIGH REYNOLDS NUMBERS Ph.D. Thesis
Joseph Adel Laitone 1979 96 p
Avail: Univ. Microfilms Order No. 8014768

A general numerical solution is presented which extends a numerical scheme for gas flow to a solution suitable for dilute gas solid particle flows over a much wider range of conditions and geometries. The proposed method is designed to solve the time dependent equations but may be used in the steady state case as well. An exact solution for the inviscid two phase flow near a stagnation point is also presented. A transformation is used that reduces the partial differential governing equation to a second order linear differential equation. The numerical method is applied to the flow of gas and particles about a cylinder. A cutoff value is found in particle size which determines particles that do not impact with the cylinder but are deflected around it. Dissert. Abstr.

A NEW THEORY OF TURBULENT CONVECTION OVER A HEATED SURFACE
Ching-Sheng Chern 1980 86 p
Avail: Univ. Microfilms Order No. 8014264

The turbulent thermal convection which exists between two horizontal plates was investigated and field observations of the planetary boundary layer were made under unstable conditions. It is shown that near a surface there exist large eddies with a typical horizontal length scale of the order of H, the total convection layer thickness. The interaction of these big eddies with the surface and general frictional processes in the wall region are associated with a second boundary layer, called the mesolayer, whose thickness, when scaled on the buoyancy flux at the wall q and viscosity v, is proportional to R(1/4). In the mesolayer, the big eddies are anisotropic and three dimensional. They get their kinetic energy from the energy of the outer region which originates as available potential energy. Dissert. Abstr.

HEAT AND MASS TRANSFER FROM A ROTATING DISK WITH PHASE CHANGE Ph.D. Thesis
Chi-Sheng Wang 1979 118 p
Avail: Univ. Microfilms Order No. 8014921

Experimental measurements were made in a rotating disk evaporator. The condensate flow rate, pressure, and temperature across the disk and the rotational speed of the disk were measured. The overall heat transfer coefficients were determined from the above measured data. Tests were carried out on a copper disk with and without a wiper on the evaporation surface of the disk and on a monel disk with a wiper. Evaporation heat transfer coefficients were calculated based on the thermal resistance method. A study of impinging, rotating, and condensing flow was carried out. An integral method was used to obtain the results for the impinging flow case. Two impinging conditions are considered: A liquid boundary layer only, without a vapor drag effect and two boundary layers, liquid and vapor, with a vapor drag effect. The results show that the copper disk with a wiper yields higher condensation rates, evaporation heat transfer coefficient, and overall heat transfer coefficients than does the copper disk without a wiper. Also, the copper disk with a wiper yields higher values than does the monel disk with a wiper. The theoretical studies show that the effect of vapor drag on the condensation heat transfer is small for impinging flow. Dissert. Abstr.

N80-27626 California Univ., Berkeley.
FINITE DIFFERENCE SOLUTION OF THE NONLINEAR COSSERAT JET EQUATIONS FOR A VISCOUS FLUID WITH SURFACE TENSION Ph.D. Thesis
Sabbas Joseph Shine 1979 138 p
Avail: Univ. Microfilms Order No. 8014877

A simultaneous finite difference solution of the nonlinear Cosserat fluid jet equations for a semi-infinite jet emanating from a nozzle is presented. The problem is treated as a time dependent one with a small amplitude periodic excitation of the velocity at the nozzle. Solutions for the jet radius and velocity are computed until the radius becomes zero or the absolute value of the velocity exceeds a chosen maximum value. It is shown that when the dimensionless frequency of the excitation is less than one the generated wave grows in amplitude until it finally breaks up the jet at a definite point downstream. The breakoff point depends on the frequency and amplitude of the excitation, the jet velocity, and the viscosity of the fluid. When

the frequency of excitation is more than one the disturbance is stable and therefore no jet breakup occurs. Even for the unstable frequencies of excitation is less than one, high viscosity can appreciably damp out the growth of the disturbance.

THE SOLUTION OF BOUNDARY VALUE PROBLEMS IN DIFFUSIVE HEAT AND MASS TRANSFER WITH CONVECTION: FUNCTIONAL ANALYTIC METHODS Ph.D. Thesis
Eleftherios Papoutsakis 1979 303 p
Avail: Univ. Microfilms Order No. 8015503

An entirely analytical solution to the Graetz problem with a variety of wall boundary conditions was formulated based on a self-adjoint formalism resulting from a decomposition of the convective diffusion equation into a pair of first order partial differential equations. Physically, the decomposition views the convective diffusion process as a pair of stipulations on how the temperature (or concentration) and the axial energy (or mass) flow through a partial tube cross section vary with radial and axial distances. The solutions obtained are simple, and readily computed. A variety of computational results are also discussed physically.

Dissert. Abstr.

TURBULENCE AND VORTEX DYNAMICS IN TWO DIMENSIONS Ph.D. Thesis
Hassan Aref 1980 126 p
Avail: Univ. Microfilms Order No. 8015634

The dynamics of a system of point vortices in the plane is studied, both analytically and numerically, as a model of two dimensional flow. It is argued, that the basic interacting unit in an N-vortex system is a triple of vortices. It is a classical result that the motion of three point vortices of arbitrary strengths, defines an integrable Hamiltonian system. A novel analysis of the properties of the motion of three vortices is given using a phase diagram technique. This generalizes recent work by Novikov on the motion of three identical vortices. A complete classification is obtained of possible regimes of motion as the vortex strengths are varied. When the vortex strengths (K sub 1, K sub 2, K sub 3) have the values (+K,+K,-K) the phase diagram can be interpreted in terms of the scattering of a neutral vortex pair by a single vortex. Details of the scattering process are presented. If the harmonic mean of the three strengths vanishes, the vortex triangle can expand or contract without change of shape. For certain initial conditions the triangle collapses to a point in a finite time for this case.

ANALYSIS OF ALGORITHMS FOR ADVECTION IN DISCONTINUOUS FLOWS Ph.D. Thesis
Charles Paine Fenimore 1979 110 p
Avail: Univ. Microfilms Order No. 8014674

An analysis is presented of two algorithms for the approximate solution of the equations of multifluid, gas dynamic flow in two space dimensions. Sharp interfaces separate the distinct fluids and the flow field can have discontinuities such as shocks and slip lines. The species are advected by the fluid velocity field, and there is no diffusion of the species. Both algorithms are alternating direction methods which reduce the full two dimensional problem to a sequence of one dimensional ones. A hybrid scheme is presented which has high resolution and can represent phenomena occurring on a scale smaller than the mesh size. The hybrid scheme employs the detailed information produced by Glimm's method to advance the fluid interfaces defined by the straight line algorithm. The hybrid is seen to conserve species. The method is applied to test problems in which one dimensional waves move obliquely to the two dimensional mesh sweeping over a blob in the flow. It is found that the method while of low order is able to represent interfaces sharply, even for very thin blobs. Numerical and graphical results are included.

INFLUENCE OF PRESSURE DRIVEN SECONDARY FLOWS ON THE BEHAVIOR OF TURBOFAN FORCED MIXERS
B. Anderson, L. Povinelli, and W. Gerstenmaier Jul. 1980 28 p refs Presented at 16th Joint Prop. Conf., Hartford, Conn., 30 Jun. - 2 Jul. 1980; sponsored by AIAA, ACME, and SAE
(NASA-TM-81541; E-493) Avail: NTIS HC A03/MF A01 CSCL 20C

A finite difference procedure was developed to analyze the three dimensional subsonic turbulent flows in turbofan forced mixer nozzles. The method is based on a decomposition of the velocity field into primary and secondary flow components which are determined by solution of the equations governing primary momentum, secondary vorticity, thermal energy, and continuity. Experimentally, a strong secondary flow pattern was identified which is associated with the radial inflow and outflow characteristics of the core and fan streams and forms a very strong vortex system aligned with the radial interface between the core and fan regions. A procedure was developed to generate a similar generic secondary flow pattern in terms of two constants representing the average radial outflow or inflow in the core and fan streams as a percentage of the local streamwise velocity. This description of the initial secondary flow gave excellent agreement with experimental data. By identifying the nature of large scale secondary flow structure and associating it with characteristic mixer nozzle behavior, it is felt that the cause and effect relationship between lobe design and nozzle performance can be understood.

RESEARCH ON NUMERICAL ALGORITHMS FOR THE THREE DIMENSIONAL NAVIER-STOKES EQUATIONS. 1: ACCURACY, CONVERGENCE AND EFFICIENCY Interim Technical Report, 1 Oct. 1978 - 30 Sep. 1979
A. J. Baker Sep. 1979 61 p refs
(Grant AF-AFOSR-0005-79; AF Proj. 2307)
(AD-A083664; AFFDL-TR-79-3141) Avail: NTIS HC A04/MF A01 CSCL 12/1

The objective of this research is to develop a highly accurate and efficient numerical solution algorithm for the non linear three dimensional Navier-Stokes equations for aerodynamics applications. A candidate algorithm has been derived employing finite element interpolation theory, the non-linear extension of quasi-variational principles, and the concept of tensor product bases. The resultant solution statement is rendered soluable using an implicit integration algorithm, and the replacement of the

standard Jacobian of a Newton iteration algorithm with a tensor matrix product form. A linearized stability analysis indicates the basic algorithm is spatially fourth order accurate in its most elementary embodiment. The control of an added dissipation mechanism can elevate this to sixth order, but numerical experimentation indicates the resultant artificial diffusion is unacceptably large. By the same measure, this additional accuracy is intrinsic to the quadratic element embodiment of the algorithm with freedom from artificial diffusion. The results of several numerical experiments for single and multi dimensional convection-dominated test problems confirms the basic viability of this algorithm and its tensor produce formulation. The latter is of paramount importance in rendering the algorithm nominally as efficient as familiar lower order accurate finite difference formulations. GRA

(Contract N00014-78-C-0557; RF41411801)
(AD-A083905; NR80H-11; ONR-CR-212-249-2F) Avail: NTIS HC A03/MF A01 CSCL 20/4

A numerical method has been developed to calculate the effects of curvature on the turbulent mixing within a thrust augmenting ejector. Curvature modification are included in both the kinetic energy and dissipation equations of the turbulence model. The elliptic effects of curvature on the mean flow are determined by combining an elliptic solution for the pressure field with a conventional marching solution for the velocity field. Predictions of the velocity profiles for jets and curved duct flows are compared with experimental data. Computation of the curvature effects are shown for an ejector having Coanda jets and one central jet. GRA

COLLOQUIUM ON FLOW SEPARATION
Roger L. Simpson Aug. 1979 107 p refs Prepared in cooperation with Southern Methodist Univ., Dallas
(Contract N00014-75-C-1143; NR Proj. 098-038; Proj. SQUID)
(AD-A083741; SQUID-SMU-3-PU) Avail: NTIS HC A06/MF A01 CSCL 20/4

Turbulent flow separation continues to be a nuisance to fluid dynamicists because it may be present in many practical machines or devices, thus reducing their performance, and because there is no adequate method to calculate such flows. In general, the maximum performance of such machines occurs at conditions close to the onset of separation. In order of increasing difficulty, designers need to know (a) whether or not a boundary layer separates for a prescribed pressure distribution, (b) how the pressure distribution is affected by boundary layer development with small regions of separated flow, and (c) how the overall performance is affected when large regions of separation are present. This Colloquium on Turbulent Flow Separation was held by Project SQUID at SMU to discuss fruitful areas for future research. A number of active researchers were invited to participate in discussions on five topics: terminology, measurements, flow modeling, unsteady effects, and control of separated flow. These topics are fundamental to future advances since a common nomenclature should be used to describe phenomena that are measured and modeled. GRA

There was general agreement that progress towards a consensus of turbulent boundary layer structural information was made, and that the directions which future research work should take were clarified. There was general recognition that a number of different coherent motions exist in the boundary layer, and that different techniques (both visual and probe) emphasize some at the expense of others. It is necessary to determine what role each of the coherent motions play, as well as the importance of the interactions between these motions. Substantial progress has been made, but a consensus emerged that more overlap of techniques and objectives is needed, and that more experiments which combine flow visualization with quantitative measurements should be performed. Three different theoretical approaches were discussed. Each qualitatively simulated the occurrence of some of the observed structural features, via their underlying mechanisms. At this stage, none of the theories can be considered complete or predictive. Some potentially important qualitative correspondences were made between numerical large eddy simulations and recent wall region data. GRA

CAVITATION DAMAGE MECHANISMS: REVIEW OF LITERATURE Final Report, Aug. 1977 - Sep. 1979
D. C. Wiggert, C. S. Martin, and H. Medlarz Wright-Patterson AFB, Ohio AFAPL Feb. 1980 58 p refs
(Contract F33615-77-C-2036)
(AD-A083805; AFAPL-TR-79-2125) Avail: NTIS HC A04/MF A01 CSCL 13/7

This report is a companion volume to 'Cavitation Damage Mechanisms: Experimental Study of Cavitation in a Spool Valve.' The state-of-the-art available in the literature is reviewed relative to occurrence of cavitation, the effects of dissolved and free gas, and so-called secondary aspects of combustion/sonoluminescence and electrical/chemical effects. It should be noted that a paucity of literature exists with regard to cavitation in oil hydraulic systems; consequently much of the material discussed deals with water as the working fluid. Throughout the text, clear distinctions are made as to the fluid under discussion. The small number of references which do relate to oils are covered as thoroughly as deemed necessary. The last topic to be presented concerns cavitation in hydraulic actuators. This is a markedly different type of cavitation than is dealt with in the present experimental study; it is included for completeness and due to the fact that it can be a potential problem in control system performance, although most often it creates no permanent mechanical damage to actuator components. GRA

INVESTIGATION OF THREE-DIMENSIONAL SHOCK WAVE BOUNDARY LAYER INTERACTIONS. A FLOWFIELD MODEL OF THE GLANCING SHOCK/TURBULENT BOUNDARY LAYER INTERACTION Final Scientific Report, Jun. 1976 - Oct. 1979
H. Kubota Jan. 1980 231 p refs
(Grant AF-AFOSR-3006-76)
(AD-A083703; COA-8001) Avail: NTIS HC A11/MF A01 CSCL 20/4

Three-dimensional glancing-shock/turbulent boundary-layer interaction has been investigated at the Cranfield Institute of Technology in two separate test programmes using a 2.5 x 2.5 inch intermittent tunnel and a 9 x 9 inch continuous tunnel, at a Mach number of approximately 2.5. The experimental results

include oil-flow pictures, vapour-screen photographs, surface static pressure distributions, local heat transfers, liquid crystal pictures of surface temperature, and viscous layer surveys. The test data indicate that the interaction region consists of two different viscous flows, the side-wall boundary layer and an induced layer originating near the shock generator root and crossing the path of the side-wall boundary layer. In this flow field model, no flow separation appears as long as the surface stream lines of the side-wall boundary layer can be pliable enough to be bent along the edge of the induced layer, even when the surface-flow deflection exceeds the shock angle. However, an ordinary separation does take place when the induced layer forces the surface stream lines to deflect beyond a maximum permissible angle. GRA

CALCULATION OF THE LAMINAR VISCOSITY OF A GASEOUS MIXTURE FOR GAS DYNAMIC MIXING COMPARISONS FOR A REACTING SHEAR LAYER
B. J. Walker Oct. 1979 55 p refs
(AD-A083970; DRSMI/RD-80-2) Avail: NTIS
HC A04/MF A01 CSCL 20/4

This investigation determined the laminar viscosities of NO2 and O3 at elevated temperatures. The technique to accomplish this is relevant to other gases and a generalized method for calculation of viscosities of other gases is presented. The results are compared to the calculational method of Svehla (2) for CO2 at elevated temperatures. A cubic spline interpolation routine using a Lagrangian polynomial treatment of the end points is formulated and coded. GRA

HC A05/MF A01 CSCL 20/4

At the start, three and a half years ago, the finite fluid element method Section 1 was the only one under consideration. Things went badly with that method, and progress with its implementation went far more slowly than we ever anticipated. As a result, by the end of the first year, a second method, which originally was developed for a check on results of the first, had become by far the more promising of the two. Most of this report Sections 3-6 describes progress we have made with the application of biased differences Section 2 to a variety of fairly difficult problems of numerical fluid mechanics. Finally, in the last six months of the period covered by this report, the major difficulties with finite fluid elements were overcome, so it became possible to begin a comparison of the two methods Section 6. Preliminary indications are that both methods are reliable, and both considerably more efficient than a third method with which they have been compared. Section 7 is a report of progress with a boundary integral method that is not closely related to the others except by being numerical, and Section 8 is a description of the kinds of graphical software we had to develop for interpretation of our numerical computations. (AD-A084546; AEDC-TR-79-79) Avail: NTIS
HC A04/MF A01 CSCL 20/4

An experimental investigation of ducted, two-stream, subsonic, turbulent jet mixing with recirculation was conducted. A primary jet of air at a mass flow rate of 0.580 lbm/sec and bulk velocity of 335 ft/sec was surrounded by an outer hydrogen stream at a mass flow rate of 0.002 lbm/sec and bulk velocity of 3 ft/sec (overall equivalence ratio of 0.12). The ratio of the duct to inner nozzle diameter was 2.5. Radial distributions of mean axial and radial velocity, axial and radial turbulence intensity, velocity cross correlation, gas composition, static temperature, and total pressure, as well as axial distribution of wall static pressure, are presented for axial stations from zero to six duct diameters from the nozzle exit plane, both with and without chemical reactions. The maximum turbulent intensities which occurred in the center of the mixing layer and within the recirculation eddy were very high, having values in excess of 20 percent of the jet exit velocity. The data clearly indicate that the mixing is slower in the chemically reactive flow field than in the nonreactive flow field and that the presence of chemical reactions had a significant effect on the size and location of the recirculation zone within the mixing duct. FUNDAMENTAL RESEARCH IN TURBULENT MODELING Annual Technical Report, 1 Jan. - 31 Dec. 1979
Carmen Cerasoli, Coleman dup Donaldson, and Guido Sandri Feb. 1980 44 p refs
(Contract F44620-76-C-0048; AF Proj. 2307)
(AD-A084238; ARAP-TM-80-2; AFOSR-80-0324TR) Avail: NTIS HC A03/MF A01 CSCL 20/4

A summary of both the theoretical and experimental studies carried out during the first year of a program of fundamental research on turbulent modeling is given. On the theoretical side, the application of a modeled tensor scale equation together with a modeled Reynolds stress equation to the case of homogeneous shear flow is discussed in some detail. It is shown that such modeling gives results that are in good agreement with experiment. On the experimental side, preliminary data on the effect of swirl on the structure of turbulence in an annular pipe flow are presented. GRA

NUMERICAL SOLUTIONS FOR LAMINAR BOUNDARY LAYER BEHIND BLAST WAVES Interim Report
Shaowen W. Liu and Harold Mirels 1 May 1980 109 p refs
(Contract F04701-79-C-0080)
(AD-A084435; TR-0080-5940-02-2; SP-TR-80-23) Avail: NTIS HC A09/MF A01 CSCL 20/4

Numerical solutions are obtained for plane and axisymmetric laminar boundary layers induced by blast waves. Explicit dependence on time is eliminated by a similarity transformation. The entire region between the shock and the blast origin is considered. Numerical results are presented for ideal air. Wall shear and heat transfer are found to increase at a rate faster than that indicated by previous solutions for the flow directly behind the shock. The results are applicable in the laminar boundary layer region. R.C.T.

(AD-A084187; NOSC/TR-502) Avail: NTIS
HC A02/MF A01 CSCL 20/4

The analysis of flow visualization data documenting a variety of fluid phenomena has been severely limited in the past by the subjective nature of data interpretation and limitations imposed by actual sample size. Video digitization offers a reliable method of automating the analysis of such visual data. This paper describes an experiment wherein the distribution of sizes of bubbles formed by air injection into a water stream was found. Previous results were limited to special cases due to the amount of data required for a full documentation. Several geometric and flow parameters were varied and their effects are reported. Data reduction was via a digital image processing system. This type of system holds the promise of high speed, objective data reduction for a broad range of fluid mechanics problems. GRA

AN EXPERIMENTAL STUDY OF INWARD AND OUTWARD FLOW IN A TURBULENT BOUNDARY LAYER [ETUDE EXPERIMENTALE DES APPORTS ET DES EJECTIONS DE FLUIDE DANS UNE COUCHE LIMITE TURBULENTE]
M. Elena, L. Fulachier, and R. Dumas *In* AGARD Turbulent Boundary Layers Jan. 1980 21 p refs In FRENCH; ENGLISH summary (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Experimental results concerning the structure of the internal and external zone of the boundary layer are presented. In the viscous sublayer, the flow has obvious intermittent characteristics; particularly the inward flows from regions which are farther from the wall prevail over the outward flows and penetrate the sublayer randomly. As the number of inward flow decreases with uncreasing distance from the wall, it becomes of the same order as the number of outward flow in the fully turbulent region. The measurements of the space-time correlations reveal that, at least in the internal region, there exists a linkage between the inward and outward flows, the latter being the more dominating. Measurements of conditional probabilities show that the trajectories of these disturbances are in agreement with the trajectories obtained through visualizing or measuring thermal diffusion from a point located at the wall. Additionally, measurements of three point space-time correlations indicate that the outward flows are more coherent and spanwise thinner than the disturbances corresponding to the inward flow. These outward flows expand when moving off the wall and diffuse through the boundary layer. R.E.S.

EXPERIMENTAL STUDY OF COHERENT STRUCTURES IN THE TURBULENT BOUNDARY LAYER OF PIPE FLOW USING LASER-DOPPLER ANEMOMETRY
H. R. E. vanMaanen *In* AGARD Turbulent Boundary Layers Jan. 1980 20 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

The coherent structures in the turbulent boundary layer of a pipe flow were investigated. These structures, often called bursts, are thought to be the main mechanism involved in the generation and maintenance of turbulence in flow. Measurements were carried out in a pipe 6 m long and 50 mm in internal diameter, filled with water, using a laser-Doppler velocimeter, down to 0.25 mm from the wall, with the size of the measuring volume in radial direction being 0.1 mm. The output signal of the laser-Doppler anemometer, which can be regarded as the flow velocity, was fed into a burst detector and into an electronic delay line. The output signal of the burst detector was used to conditionally average the delayed signal. The conditional averages close to the pipe wall ($y(+)$ approximately equal to 20) were in good agreement with those found by Blackwelder and Kaplan, but further from the wall significant deviations were observed. Burst phenomena even for $y(+) = 100$ were found indicating that the structure is bigger than expected. Results of the measurements of the burst frequency spread as a function of the Reynolds number, as well as the conditional averages, are presented. R.E.S.

TURBULENT BOUNDARY LAYER AT LOW AND HIGH SUBSONIC SPEEDS
V. Zakkay, V. Barra, and K. Hozumi *In* AGARD Turbulent Boundary Layers Jan. 1980 20 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Results of simultaneous measurements of velocity, wall pressure, and wallshear fluctuations in a turbulent boundary layer are presented. The results were analyzed in an attempt to obtain a description of the coherent or quasiordered structure of the boundary layer turbulence. On a large scale, the boundary layer is dominated by vortical structures which extend to the viscid-inviscid region. The wall region is dominated by the so called bursting process. The relationship or interaction between the large scale outer structure and the turbulent bursts is still not clearly defined. The results of this investigation at high speed, while confirming some of the previous results with regard to the mean period between coherent events, and their geometrical configuration, did not yet resolve the question as to whether at high subsonic speeds there is, besides the outer flow processes, a distinct inner region. With the limited instrumentation available it was not possible at the high subsonic speed to resolve any inner sublayer region, although it was found that the outer flow structures exert a strong influence on the wall. The experimental results at low subsonic speeds, on the other hand, did identify an inner and outer region, and duplicated some of the results obtained at low subsonic speed by other investigations. R.E.S.

AN INVESTIGATION OF THE STRUCTURE OF EQUILIBRIUM TURBULENT BOUNDARY LAYERS

L. F. East and W. G. Sawyer *In* AGARD Turbulent Boundary Layers Jan. 1980 19 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Seven low speed equilibrium boundary layer flows ranging from mildly favorable pressure gradients to adverse pressure gradients almost sufficient to cause incipient separation are described. The flows are turbulent and second and third order correlations of the turbulence are included in addition to measurements of the mean flow. The flow parameters are shown to be consistent with existing equilibrium loci. It is also shown that the law of the wall applies to all the flows and that therefore the value of von Karman's 'constant' in the mixing length formulation of shear stress must vary. The data strongly support the concept of gradient diffusion and it is demonstrated that for flows in strong adverse pressure gradient the shear stress gradient results from the strong diffusion of turbulence towards the wall and not from changes in the dissipation term. Thus, although the mixing length is dependent upon pressure gradient, the dissipation length is not. R.E.S.

EQUILIBRIUM BOUNDARY LAYERS OVER VERY ROUGH SURFACES
I. S. Gartshorne and K. A. deCroos *In* AGARD Turbulent Boundary Layers Jan. 1980 11 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Commonly used wall shear stress correlations appropriate for rough walls imply a degree of equilibrium between the boundary layer and the wall. For two roughness geometries examined experimentally in zero pressure gradient, equilibrium in the mean velocity appears to exist beyond 350 times the roughness height from the origin of roughness. For moderately close spacing of simple three dimensional roughness elements, a correlation due to Dvorak appears accurate; for less dense spacing (but still fully rough conditions) the correlation underestimates the wall stress significantly. The equilibruim boundary layer studied experimentally showed unexpectedly large turbulent intensities, constant integral length scales, no region of constant stress and a semi-logarithmic region best described with a von Karman constant of 0.36 + or - .02. LONGITUDINAL VORTICES IN CONCAVE SURFACE BOUNDARY LAYER
R. I Crane and S. H. Winoto *In* AGARD Turbulent Boundary Layers Jan. 1980 10 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Local measurements of mean and fluctuating velocity by laser anemometer were made inside the developing concave surface boundary layer in a free surface water channel at Reynolds numbers up to 16000. Concave surface radius was 3.5 times channel width and the ratio of spanwise mean boundary layer thickness to surface radius ranged between 0.03 and 0.11. Systems of longtitudinal vortices developed without artificial triggering. Vortex wavelength varied across the span by as much as a factor of 2, but mean wavelength was typically 1.3 times the boundary layer thickness and did not vary significantly in the flow direction. Continuous vortex growth at Reynolds number = 9800 contrasted with apparent breakup of the vortices at Reynolds number = 16000. R.C.T.

LARGE EDDY SIMULATION OF TURBULENT CHANNEL FLOW: ILLIAC 5 CALCULATION

John Kim and Parviz Moin *In* AGARD Turbulent Boundary Layers Jan. 1980 18 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01 CSCL 20D

The capabilities of large eddy simulation in the prediction and analyses of wall-bounded turbulent shear flows are demonstrated. The dynamical equations for large scale field motions are derived. The computational grid network is described and its relation to the observed physical length scales in the flow are discussed. Some aspects of the mechanics and structure of the flow are examined both in the vicinity of the wall and in regions away from the wall. An attempt is made to correlate numerical results with laboratory observations. Other significant observations and conclusions are presented. R.C.T.

N80-27662# Advisory Group for Aerospace Research and Development, Neuilly-Sur-Seine (France).
A TURBULENCE CLOSURE OF THE TRANSPORT EQUATION FOR THE PROBABILITY DENSITY OF VELOCITY
M. M. Ribeiro (CTAMFUL-DTA, Lisbon) *In its* Turbulent Boundary Layers Jan. 1980 12 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

A proposal for a first order closure of the hierarchy of transport equations for the probability density of velocity in a turbulent field is presented. The fluid is assumed to be incompressible and Newtonian. The effects of the pressure deviations on the probability density are modelled based on the assumption of homogeneous behavior of the flow field. The closure is shown to be compatible with a well-known Reynolds stresses closure. Particular attention is given to the physical implications of the assumptions embodied in the modelling of the unknown terms that occur in the exact equation. R.C.T.

MODELLING REQUIREMENTS FOR THE CALCULATION OF THE TURBULENT FLOW AROUND AIRFOILS, WINGS AND BODIES OF REVOLUTION
Turner Cebeci and H. U. Meir (Deutsche Forschungs- und Versuchsanstalt Fuer Luft- und Raumfahrt, Goettingen, West Germany) *In* AGARD Turbulent Boundary Layers Jan. 1980 12 p refs (For primary document see N80-27647 18-34)
(Contract N00019-78-M-0466)
Avail: NTIS HC A17/MF A01

The merits of turbulence models were considered for the calculation of the flow around geometric configurations of relevance to airplane and missile design. Calculated results obtained with three turbulence models were compared to each other and to the boundary layer measurements. Significant results are reported. R.C.T.

THE TURBULENT BOUNDARY LAYER AND THE CLOSURE PROBLEM
Leif N. Persen *In* AGARD Turbulent Boundary Layers Jan. 1980 5 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Previous attempts to establish a proper phenomenological relation for turbulent flows are reviewed followed by a suggested approach to the problem in the case of a turbulent boundary layer. An attempt is made at showing the extreme flexibility that such a relation must exhibit if it is to account for effects of outside conditions and pre-history of the flow. By selecting proper 'inner variables' as parameters and properly characterizing the outer flow it is shown how a sufficiently general phenomenological relation can be established and how the closure problem may thus be considered in a different perspective. BOUNDARY LAYER MEASUREMENTS ON A TWO-DIMENSIONAL WING WITH FLAP AND A COMPARISON WITH CALCULATIONS
B. vandenBerg and B. Oskam *In* AGARD Turbulent Boundary Layers Jan. 1980 14 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

Measurements performed on a wing flap configuration which was so designed that flow separations occur nowhere apart from a small laminar separation bubble on the wing nose are presented and discussed. The measurements comprise surface pressure measurements, boundary layer and wake traverses at 16 stations, and flow visualization tests to establish the presence of separation bubbles and boundary layer transition regions. The data resolve the various flow phenomena sufficiently well to provide a significant test case for calculation methods for the flow around multielement airfoils. Comparison with such a calculation method showed satisfactory agreement in many respects. A need for improved modelling was found to exist in some regions, particularly for the wing wake above the flap. M.G.

THREE-DIMENSIONAL TURBULENT BOUNDARY LAYER: RESTRUCTURATION OF AN AXISYMMETRIC FLOW SUBJECTED TO A DISCONTINUITY OF THE WALL PERIPHERAL VELOCITY [COUCHE LIMITE TURBULENTE TRIDIMENSIONNELLE: TRIQUE SOUMIS A UNE DISCONTINUITE DE LA VITESSE DE PAROI]
E. Arzoumanian, L. Fulachier, Jean Cousteix (ONERA, Toulouse), and Bertrand Aupoix (ONERA, Toulouse) *In* AGARD Turbulent Boundary Layers Jan. 1980 11 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

The influence of the rotation of a cylinder on the restructuration of a developing three dimensional boundary layer is studied by using the analysis of the mean velocity field. A three dimensional turbulent boundary layer is developed on a circular cylinder the axis of which is parallel to the flow. In the downstream region the boundary layer is fully developed and the rear part of the cylinder rotates about its axis. The peripheral velocity at the wall is practically equal to the external velocity. The model used can account for the inequality of the turbulent shear stress direction and the velocity gradient direction. Emphasis is placed on the study of the buffer layer down to the viscous sublayer. The measurements reveal that the collaterality of the flow is first obtained in a very thin region near the wall and then seems to extend progressively in the boundary layer. In contrast, the calculations indicate a more extended linear portion of the hodograph. M.G.

EVIDENCE FOR INSTABILITY-WAVES IN THE VELOCITY-FIELD OF A FULLY DEVELOPED TURBULENT CHANNEL-FLOW
Michael Hofbauer *In* AGARD Turbulent Boundary Layers Jan. 1980 5 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

The results from hot film measurements and quantitative visual investigations, performed in the turbulent flow of an oil-channel at a low Reynolds number (Re = 8000), are discussed. The main result of the hot film measurements is the power spectrum of the v-component of the fluctuating velocity. The power spectrum has regular maxima and minima. The frequencies corresponding to the maxima of the power spectrum are plotted as a function of the order n of the maxima. This graph demonstrates that the frequencies of the maxima are the harmonics of a fundamental frequency which are determined to be about 0.15 Hz. An estimation shows that the fundamental frequency is of the same order of magnitude as the roughly calculated unstable Tollmien-Schlichting frequencies of the mean turbulent velocity profile. This fundamental frequency is interpreted as the most excited frequency of Tollmien-Schlichting-like instability waves. The harmonics are believed to be due to a nonlinear amplification of the primarily excited instability waves. The evidence of regular oscillations in the near-wall region of the fully developed turbulent flow from the visual studies is examined. M.G.

EXPERIMENTAL RESULTS CONCERNING THE INFLUENCE OF TRANSITION PROCESSES ON THE INITIAL STRUCTURE OF A TURBULENT BOUNDARY LAYER
Daniel Arnal and Jean-Claude Juillen *In* AGARD Turbulent Boundary Layers Jan. 1980 9 p refs In FRENCH; ENGLISH

summary (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

How the initial structure of the turbulent boundary layer can be influenced by the transition mechanism is examined. In the case of zero pressure gradient the evolution from the laminar to the turbulent regime is characterized by the intermittency phenomenon; the conditional sampling of the hot wire signal shows that the turbulent spots exhibit a structure similar to the classical turbulent boundary layer structure. With a mild positive pressure gradient, it becomes difficult to describe the intermittency. When the transition is beginning downstream from the laminar separation point, the shape parameter decreases but the intermittency appears no longer. Only a progressive deformation of the instability waves is observed; at the end of the transition, the spectrum of the turbulent energy is composed of a series of peaks corresponding to harmonics of the instability waves. SOME MEASUREMENTS IN SYNTHETIC TURBULENT BOUNDARY LAYERS
Oemer Savas *In* AGARD Turbulent Boundary Layers Jan. 1980 12 p refs (For primary document see N80-27647 18-34) (Grants NSF ENG-75-03694; NSF ENG-77-23541)
Avail: NTIS HC A17/MF A01

Synthetic turbulent boundary layers are examined which were constructed on a flat plate by generating systematic moving patterns of turbulent spots in a laminar flow. The experiments were carried out in a wind tunnel at a Reynolds number based on plate length of 1,700,000. Spots were generated periodically in space and time near the leading edge to form a regular hexagonal pattern. The disturbance mechanism was a camshaft which displaced small pins momentarily into the laminar flow at frequencies up to 80 Hz. The main instrumentation was a rake of 24 hot wires placed across the flow in a line parallel to the surface. The main measured variable was local intermittency; i.e., the probability of observing turbulent flow at a particular point in space and time. The results are reported in x-t diagrams showing the evolution of various synthetic flows along the plate. The dimensionless celerity or phase velocity of the large eddies is found to be 0.88, independent of eddy scale. All patterns with sufficiently small scales eventually showed loss of coherence as they moved downstream. A novel phenomenon called eddy transposition was observed in several flows which contained appreciable laminar regions. The large eddies shifted in formation to new positions, intermediate to their original ones, while preserving their hexagonal pattern. The present results, together with some empirical properties of a turbulent spot, are used to estimate the best choice of scales for constructing a synthetic boundary layer suitable for detailed study. The values recommended are: spanwise scale/thickness = 2.5, streamwise scale/thickness = 8. M.G.

COHERENT STRUCTURES IN TURBULENT BOUNDARY LAYERS
R. F. Blackwell *In* AGARD Turbulent Boundary Layers Jan. 1980 7 p refs (For primary document see N80-27647 18-34) (Grant DAAG29-76-G-0297)
Avail: NTIS HC A17/MF A01

The nature of coherent eddy structures in turbulent boundary layers is examined. The dynamics of turbulent boundary layers are controlled by two different eddy structures. In the intermittent region, the large scale outer structure dominates the flow field and controls the entrainment of nonturbulent fluid. Near the wall, counter-rotating streamwise vortices, with resulting elongated streaks of low speed fluid lying between them, are the predominate eddies. The interaction between these two different eddy structures seems to be the primary means by which turbulent energy is produced. The main features of these characteristic eddies are reviewed and some remaining problems are outlined. M.G.

FLOW VISUALIZATION OF TURBULENT BOUNDARY LAYER STRUCTURE
M. R. Head and P. Bandyopadhyay *In* AGARD Turbulent Boundary Layers Jan. 1980 12 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A17/MF A01

The results from flow visualization experiments performed using an argon-ion laser to illuminate longitudinal and transverse sections of the smoke filled boundary layer in zero pressure gradient are discussed. Most of the experiments were confined to the range 600 < Re sub theta < 10,000. Results indicate that the boundary layer consists almost exclusively of vortex loops or hairpins, some of which may extend through the complete boundary layer thickness and all of which are inclined at a more or less constant characteristic angle of approximately 45 deg to the wall. Since the cross-stream dimensions of the hairpins appear to scale roughly with the wall variables U sub tau and nu, while their length is limited only by the boundary layer thickness, there are very large scale effects on the turbulence structure. At high Reynolds numbers (Re sub theta = 10,000) there is little evidence of large-scale coherent motions, other than a slow overturning of random agglomerations of the hairpins just mentioned. M.G.

SOME OBSERVATIONS OF THE STRUCTURE OF THE TURBULENT BOUNDARY LAYER
Andrew S. W. Thomas *In* AGARD Turbulent Boundary Layers Jan. 1980 11 p refs (For primary document see N80-27647 18-34)
Avail: NTIS HC A02/MF A01

Results are presented to describe some measured features of the organized large structure of a turbulent boundary layer. The spanwise correlation scale, the conditional Reynods stress contribution, and the experimentally determined streamline pattern of the large structure are discussed. Correlation and conditional sampling techniques are employed to examine the influence of this structure at the wall. It is found that increased activity at the wall is associated with curved streamlines. This is to be expected if it is a rotational instability that couples the turbulent bursts to the large structure. Author

RESONANT DOPPLER VELOCIMETER Ph.D. Thesis
Micha Zimmermann 1980 230 p
Avail: Univ. Microfilms Order No. 8016470

A technique for visualization and for quantitative measurements of velocity, temperature and pressure of a gaseous flow was developed. These were achieved by shining a single frequency laser beam into a flow which was seeded with an atomic species. The laser was tuned through the absorption frequencies of the seeded species and the absorption profile was detected by observing fluorescence as the atoms relax back to the ground state. The flow velocity was determined by observing the Doppler shift in the absorption frequency. Spectroscopic absorption line broadening mechanisms furnished information regarding the static temperature and pressure of the moving gas. Dissert. Abstr.

(NASA-TM-80641) Avail: NTIS HC A03/MF A01 CSCL 14B

A self-contained, portable, hand-radiometer designed for field usage was constructed and tested. The device, consisting of a hand-held probe containing three sensors and a strap supported electronic module, weighs 4 1/2 kilograms It is powered by flashlight and transistor radio batteries, utilizes two silicon and one lead sulfide detectors, has three liquid crystal displays, sample and hold radiometric sampling, and its spectral configuration corresponds to LANDSAT-D's thematic mapper bands. The device was designed to support thematic mapper ground-truth data collection efforts and to facilitate 'in situ' ground-based remote sensing studies of natural materials. Prototype instruments were extensively tested under laboratory and field conditions with excellent results. Author

LARGE ANTENNA MULTIFREQUENCY MICROWAVE RADIOMETER (LAMMR) SYSTEM DESIGN
J. Larry King May 1980 33 p refs
(NASA-TM-80685) Avail: NTIS HC A03/MF A01 CSCL 14B

The large Antenna Multifrequency Microwave Radiometer (LAMMR) is a high resolution 4 meter aperture scanning radiometer system designed to determine sea surface temperature and wind speed, atmospheric water vapor and liquid water, precipitation, and various sea ice parameters by interpreting brightness temperature images from low Earth orbiting satellites. The LAMMR with dual linear horizontal and vertical polarization radiometer channels from 1.4 to 91 GHZ can provide multidiscipline data with resolutions from 105 to 7 km. The LAMMR baseline radiometer system uses total power radiometers to achieve delta T's in the 0.5 to 1.7 K range and system calibration accuracies in the 1 to 2 deg range. A cold sky horn/ambient load two point calibration technique is used in this baseline concept and the second detector output uses an integrated and dump circuit to sample the scanning cross-tract resolution cells.

New comparisons are made between the theory of Stewartson, as modified by Wedemeyer, and existing experimental measurements of the motion of liquid-filled gyroscopes. Errors in previous comparisons are pointed out and corrected, as are some errors in several published presentations of the theory. Because some key parameters were not recorded during the experiments, complete comparisons of theoretical predictions with observed behavior cannot be made. The limited comparisons which can be made show that predicted and measured frequencies of greatest instability of the motion agree to within the experimental error; the growth rates of these frequencies agree to within 10% for Reynolds number greater than 10 to the 4th power, and to within 25% for the lower Reynolds number. At the Naval Air Propulsion Center, it has a specific requirement to make accurate mass flow measurements on the fuel flow of a gas turbine engine to determine the performance characteristics. The problem of acquiring mass flow from the inherent volumetric flow data of a turbine flowmeter is discussed. The development of a universal curve from calibration data is discussed. The unique curve fits for flowmeter, viscosity and specific gravity and their use during on-line data acquisition is described. The accuracy of the final mass flow data and its dependence on the errors associated with viscosity, specific gravity, temperature and frequency measurement is discussed. Some techniques used at NAPC to reduce these errors are described. GRA

LASER INDUCED FLUORESCENCE SPECTROSCOPY OF OH IN FLAMES Ph.D. Thesis
Calvin Kwok-Yu Chan 1979 155 p
Avail: Univ. Microfilms Order No. 8014633

A technique using laser-induced fluorescence spectroscopy to make OH concentration measurements in flames was developed. The technique requires modeling the dynamics of the relaxation processes of the OH molecules under excitation and solving the rate equation of every rotational level to obtain the number density distribution in the excited states. The emission spectrum based on this distribution was compared with the fluorescence spectrum to back out the quenching cross section and hence the fluorescence yield of the excited OH molecules through an iterative procedure. Absolute calibration of the OH concentration was made using laser absorption spectroscopy. A linear curve of growth for the fluorescence signal was obtained. Local temperature information was also obtained through the same matching process. Other aspects of laser-induced fluorescence spectroscopy including quenching, saturation, trapping and chemistry effects have also been discussed. The potential of using this technique to make turbulent measurements was assessed. Probability distribution function measurement of OH concentration in turbulent flames was demonstrated. Dissert. Abstr.

OPTICAL PERFORMANCE ANALYSIS OF CO2 LASER FUSION SYSTEMS Ph.D. Thesis
George Nelson Lawrence 1980 164 p
Avail: Univ. Microfilms Order No. 8015595

The components and phenomena which must be considered in the analysis of the CO2 laser fusion system are described. The applicability of ray trace, interferogram reduction, and prior diffraction propagation programs is discussed. The basic structure of the LOTS CO2 laser fusion analysis program is outlined. The general three dimensional complex amplitude description. Methods of treating the nonlinear gain and saturable absorber media are developed. The numerical calculation of near-field diffraction distributions in noncollimated beams and the far-field diffraction distributions in spatial filters and imaging is discussed. Estimates of sampling errors are developed for the case of diffraction from a uniformly illuminated circular aperture for the near and far field. Methods of introducing interferometric data into the calculations are described. Smoothed random wavefronts are used to substitute for components known only by their specification values. Requirements and techniques of construction of these random wavefronts are explored. Capabilities and commands for the LOTS program are presented. A preliminary design of the Antares 100 kilojoule CO2 laser fusion system is analyzed to demonstrate how the LOTS code is used. Dissert. Abstr.

WAVEFRONT REPRODUCTION BY STIMULATED BRILLOUIN AND RAMAN SCATTERING Ph.D. Thesis
Robert Mays, Jr 1979 93 p
Avail: Univ. Microfilms Order No. 8014213

Experimental investigations were made of the wavefront reproduction process (WFR) by backward stimulated Brillouin scattering (SBS) and backward stimulated Raman scattering (SRS)in CS2 with a linearly polarized ruby pump beam. The experimental studies were carried out as a function of the power pump into the cell, the diameter of the optical waveguide, the length of the optical waveguide, and the frequency shift, between the pump and backscattered beams for both CS2 and C7H6O. Photographic records comparing the pump beam with the backscattered SBS and SRS beams were obtained over several orders of magnitude of exposure and quantitative measurements of percentage of nonreproduced radiation in the backscattered beams were made. In all of the cases studied there was a high degree of replication observed between the SBS and pump beams using both non-Gaussian and near-Gaussian incident laser profiles. In all of the cases studied the efficiency of the WFR process by backward SBS was better than 85% and it improved as the pump intensity was increased and the frequency shift was decreased. Neither the diameter nor the length of the optical waveguides utilized in these experiments appeared to significantly influence the efficiency of the WFR process by backward SBS. Dissert. Abstr.

HC A08/MF A01

A general discussion of free electron lasers with variable parameter wigglers is presented with a view towards their potential for the production of high power optical radiation at reasonable efficiency. The theoretical analysis is based upon a one dimensional relativistic Hamiltonian formulation and is developed in a manner to take advantage of the analogy between the free electron laser process and radio frequency accelerators. Three promising operational modes are identified and analyzed. The first may be thought of as an electron decelerator and is thought to have the most promise for single pass devices. Both oscillator and amplifier configurations are studied. The second is based upon adiabatic trapping and detrapping, intended to reduce the spread in electron energy typically induced by the FEL process. The third is based upon the method of phase area displacement. It has the advantage of wide gain bandwidth and small induced energy spread, and is thought to have the most promise for storage ring applications. Generally speaking, it is found that high peak power is intrinsic to these modes of operation. Potential problems from parasitic oscillations analogous to the stimulated Raman effect are analyzed, and some others arising from transverse inhomogeneity are identified. GRA

(AD-A084459; NPS69-79-013) Avail: NTIS
HC A09/MF A01 CSCL 20/5

To highlight in a qualitative manner the kinetics of an excimer laser, a simple computer model for calculating the species populations in a KrF laser cavity is developed; subsequently a computer program is modified to calculate the population of the different electronic configurations of excited neon present in a XeF laser. When modified, the NRL program accounts for 185 reactions and requires 9.5 minutes of CPU time using the IBM 360/67. The populations obtained are applied to the calculation of the index of refraction in the laser cavity. The phase shift is determined per unit length for two laser wavelengths; one laser wavelength is non-resonance with neon and the other is at resonance. Neon is the dominant specie relative to concentration and within the population distribution the neon ground state dominates by a factor of a million. The calculations show that the ground state neon determines the index of refraction. GRA

A STUDY OF ABRASIVE WEAR Ph.D. Thesis
Ambrish Misra 1979 152 p
Avail: Univ. Microfilms Order No. 8014814

The various types of three body abrasive wear are classified. Existing three body abrasive wear testers were examined and a tester to simulate a certain type of three body abrasive wear was designed. With simple modifications the tester can also be used for two body abrasive wear tests. A study of the effect of various variables on two body and three body abrasive wear revealed that many of the results reported in the literature are not strictly valid for two body abrasive wear. The effect of abrasive particle size on wear rate was an explanation based on a preferentially work-hardened layer near the surface due to dislocation tangles and pile-ups is presented to explain this phenomenon. A simple additive wear rule for estimating the abrasive wear damage under field conditions is given along with factors to be considered when selecting materials for abrasive wear applications. Dissert. Abstr.

FORCE BALANCING MACHINES AND OPTIMIZATION OF DYNAMIC RELATIONS FOR PLANAR MECHANISMS Ph.D. Thesis
Stephen J. Tricamo 1980 321 p
Avail: Univ. Microfilms Order No. 8014992

Experimentation showed that a mechanism designed to be fully force balanced exhibits a residual imbalance, brought about by unavoidable manufacturing tolerances and material nonhomogeneities. A theory for a group of devices which allow the complete removal of these residual shaking forces of a four bar linkage and other balanceable mechanisms, is presented and applied to the actual design of a balancing device for a four bar linkage. It was found that the goal of complete elimination of the residual shaking forces was not attainable and that it was necessary to modify the theory such that the best possible reduction in these forces could be obtained. Subsequent experiments, which use minimax as well as least squares approaches and had most successful outcomes, are described. A nonlinear optimization formulation which makes it possible to simultaneously minimize the maximum values of the various dynamic reactions of a four bar linkage while maintaining the ability to prescribe the maximum shaking force, is introduced. Dissert. Abstr.

RELEASE MECHANISM FOR RELEASING AND REATTACHING EXPERIMENTS ON THE SPACE SHUTTLE
A. V. Clark Jul. 1980 21 p
(NASA-TP-1702; M-301) Avail: NTIS HC A02/MF A01 CSCL 22B

The release mechanism (REM) unlatches an experiment so that it can be moved about inside and outside the shuttle bay by the remote manipulator system (RMS), and then reattaches it to the REM base. Operated from the crew compartment after the RMS has been attached to the experiment, the REM releases the experiment by an electric motor driving a gear train and linkage which extracts four pins from holes in four plates. Electrical connectors on the REM are disengaged by the mechanical action of the structural pins retracting from the plates. When the REM releases the experiment, an unlatched indicator is actuated in the crew compartment, and then the experiment can be moved by using the RMS. To reattach the experiment to the REM, the RMS places the experiment with REM attachment angles against the flat, smooth surface of the REM; then the RMS moves the experiment into position for latchup. Actuation of an electric motor drives the four pins into the four holes in the plates. When fully latched, a switch actuated by the motion of the linkage, shuts the electric motor off and gives an indication to the crew compartment that the REM is latched. A.R.H.

DYNAMIC ANALYSIS OF NONCONTACTING FACE SEALS
I. Etsion May 1980 40 p refs
(NASA-TM-79294; E-458) Avail: NTIS HC A03/MF A01 CSCL 11A

The dynamic behavior of a noncontacting coned face seal is analyzed taking into account various design parameters and operating conditions. The primary seal ring motion is expressed by a set of nonlinear equations for three degrees of freedom. These equations, which are solved numerically, allow identification of two dimensionless groups of parameters that affect the seal dynamic behavior. Stability maps for various seals are presented. These maps contain a stable-to-unstable transition region in which the ring wobbles at half the shaft frequency. The effect of various

parameters on seal stability is discussed and an empirical expression for critical stability is offered. Author

THE RESPONSE OF TURBINE ENGINE ROTORS TO INTERFERENCE RUBS
Albert F. Kascak 1980 18 p refs Presented at Army Sci. Conf., West Point, N. Y., 17-19 Jun. 1980 Film Supplement number C-294 to this report is available on request from Chief, Management Services Division (5-5), National Aeronautics and Space Administration, Lewis Research Center, 21000 Brookpark Road, Cleveland, Ohio 44135
(NASA-TM-81518; AVRADCOM-TR-80-C-14; E-462) Avail: NTIS HC A02/MF A01 CSCL 21D

A method was developed for the direct integration of a rotor dynamics system experiencing a blade loss induced rotor rub. Both blade loss and rotor rub were simulated on a rotor typical of a small gas turbine. A small change in the coefficient of friction (from 0.1 to 0.2) caused the rotor to change from forward to backward whirl and to theoretically destroy itself in a few rotations. This method provides an analytical capability to study the susceptibility of rotors to rub induced backward whirl problems. L.F.M.

STRESSES AND DEFORMATIONS IN ELLIPTICAL CONTACTS
Bernard J. Hamrock 1980 19 p refs Lecture presented at Lulea Univ., Sweden, 24 Jul. - 16 Aug. 1980
(NASA-TM-81535; E-488) Avail: NTIS HC A02/MF A01 CSCL 13I

Topics presented deal with defining conformal and nonconformal surfaces, curvature sum and difference, and surface and subsurface stresses in elliptical contacts. Load-deflection relationships for nonconformal contacts are developed. The deformation within the contact is, among other things, a function of the ellipticity parameter and elliptic integrals of the first and second kinds. Simplified expressions that allow quick calculations of the deformation to be made simply from a knowledge of the applied load, the material properties, and the geometry of the contacting elements are presented. FULLY FLOODED ELASTOHYDRODYNAMIC LUBRICATED ELLIPTICAL CONTACTS
Bernard J. Hamrock 1980 27 p refs Lecture presented at Lulea Univ., Sweden, 24 Jul. - 16 Aug. 1980
(NASA-TM-81543; E-497) Avail: NTIS HC A03/MF A01 CSCL 13I

Emphasis is on fully flooded, elastohydrodynamic lubricated, elliptical contacts. A fully flooded conjunction is one in which the film thickness is not significantly changed when the amount of lubricant is increased. A brief description of the relevant equations used in the elastohydrodynamic lubrication of elliptical contacts is given. The most important practical aspect of the elastohydrodynamic theory is the determination of the minimum film thickness within the contact. The maintenance of a fluid film of adequate magnitude is an essential feature of the correct operation of lubricated machine elements. The results presented show the influence of contact geometry on minimum film thickness as expressed by the ellipticity parameter and the dimensionless speed, load, and materials parameters. Film thickness equations are developed for materials of high elastic modulus, such as metal, and for materials of low elastic modulus, such as rubber. In addition to the film thickness equations that are developed, plots of pressure and film thickness are presented. These theoretical solutions for film thickness have all the essential features of previously reported experimental observations based on optical interferometry. Correlation between theory and experiments is also presented. L.F.M.

STARVED ELASTOHYDRODYNAMIC LUBRICATED ELLIPTICAL CONTACTS
Bernard J. Hamrock 1980 23 p refs Lecture presented at Lulea Univ., Sweden, 24 Jul. - 16 Aug. 1980
(NASA-TM-81549; E-507) Avail: NTIS HC A02/MF A01 CSCL 13I

A theoretical study of the influence of lubricant starvation on film thickness and pressure in hard and soft elliptical elastohydrodynamic contacts is presented. From the results for both hard and soft EHL contacts a simple and important dimensionless inlet boundary distance is specified. This inlet boundary defines whether a fully flooded or a starved condition exists in the contact. Furthermore it is found that the film thickness for a starved condition could be written in dimensionless terms as a function of the inlet distance parameter and the film thickness for a fully flooded condition. Contour plots of pressure and film thickness in and around the contact are shown for fully flooded and starved conditions. The theoretical findings are compared directly with results obtained experimentally. Author

THE WAVY MECHANICAL SEAL: THEORETICAL AND EXPERIMENTAL RESULTS Summary Report, 1 Dec. 1978 - 30 Nov. 1979
A. O. Lebeck and L. A. Young Jan. 1980 224 p refs
(Contract N00014-76-C-0071)
(AD-A083933; ME-105(80)ONR-414-1) Avail: NTIS HC A10/MF A01 CSCL 11/1

In this report the results of theoretical and experimental investigations on the effects of waviness on mechanical face seal performance are presented. In previous work it was shown how waviness imposed on a seal face leads to reduced friction and wear while creating only a small leakage in a water seal. It was also shown that the waviness must be moved slowly around the seal ring in order that the effect of waviness remain indefinitely. A test apparatus for measuring the effects of waviness is described. A computer based system is used to record the data and monitor the test. A test procedure is outlined. Results from wavy seal experiments show that waviness reduces seal wear compared to a flat face seal a factor of four to forty and reduces torque a factor of four. Long term tests show that by moving the wave the effect remains indefinitely. As the amount of waviness is increased, friction torque decreases and leakage increases. Wear profiles show that the seal faces have a tilt in addition to waviness. This alters the pressure distribution significantly when compared to the radially parallel wavy faces analyzed previously. Tests using a converging radially tapered seal show that the taper wears away with time. GRA

FLUOROALKYLENEETHER SILICATE/VITON GLT BLENDS FOR HYDRAULIC SYSTEM SEALS: SYNTHESIS, BLENDING, AND TESTING Final Technical Report, Sep. 1976 - Mar. 1979
Alan A. Shaffer, Robert E. Cochoy, and William E. Berner Mar. 1980 51 p refs
(AF Proj. 2421)
(AD-A084708; AFML-TR-79-4142) Avail: NTIS HC A04/MF A01 CSCL 11/1

Fluoroalkyleneether silicate (FES) polymers were obtained from the reaction between fluoroether bis-dimethyl carbinols and bis-dimethylamino methyl-vinyl and dimethyl silane derivatives. Peroxide cure reactivity through the pendant vinyl moieties was demonstrated. In an effort to improve the low temperature flexibility of a commercial fluorocarbon elastomer (Viton GLT from DuPont), blends were prepared using the FES materials as an additive co-curing plasticizer. Temperature retraction tests demonstrated an optimum 9 F improvement in low temperature flexibility. O-ring seal evaluations in Freon E6.5 fluid (chew and piston seal tests) demonstrated some seal enhancement and comparable durability in comparison to standard Viton GLT O-rings. GRA

ULTRASONICALLY ACTIVATED DIFFUSION BONDING FOR FLUIDIC CONTROL ASSEMBLY Final Report
Howard A. Scheetz, Paul L. Coppa, and Janet Devine Dover, N. J. Army Armament Res. And Develop. Command Feb.

1979 161 p refs
(Contract DAAA21-76-C-0186)
(AD-A084658; AD-E400293; ARLCD-CR-79005) Avail: NTIS HC A08/MF A01 CSCL 13/8

Modified ultrasonic metal bonding equipment was used to develop a new fluidic stack assembly process. Ultrasonically activated diffusion bonding was successfully applied to aluminum laminates of different sizes (up to 1 by 1 inch), different foil thicknesses (2, 3, and 5 mils), and different number of layers (up to 18). Bonds were obtained without excessive deformation, within a few seconds of ultrasonic bonding time, on as-received surfaces, with special atmospheres, on commercially prepared etched foil fluidic laminate stacks. Bonds were judged good quality from visual examination of stack surfaces and edges, from electrical resistance measurements made face to face, and from photomicrographic analysis of assembly cross sections. Analysis of the bonding system led to establishment of fundamental bonding parameters and equipment requirements for assembly of larger and thicker stacks. Investigation of the use of increased ultrasonic power for assisting the diffusion bonding of fluidic elements verified the fact that increased areas and/or thickness of laminates can be joined, but that dedicated tooling must be developed to assure the success of the process development. HYDROLYZED WOOD SLURRY FLOW MODELING
J. Wrathall and Sabri Ergun Nov. 1979 9 p Presented at the Thermochem. Conversion Contractor's Meeting, Rolla, Mo., 7 Nov. 1979
(Contract W-7405-eng-48)
(LBL-10090) Avail: NTIS HC A02/MF A01

The catalytic conversion of hydrolyzed wood slurry to fuel oil is considered. A process to convert Douglas Fir chips into a pumpable fuel at costs comparable to current spot prices for Middle Eastern crude oil was designed. Operating difficulties that have developed at the pilot plant, include the production and handling of a pumpable, nonclogging hydrolyzed slurry as feedstock for a liquefaction process. A flow system was set up to investigate the properties of the hydrolyzed slurry in hopes of acquiring proficiency in control of slurry flow and development of conditions and correlations that will be of general usefulness to the chemical engineering community. Operating directives will be issued based on the research which will be of value in solving some of the problems encountered. DOE

(PB80-164866) Avail: NTIS HC A03/MF A01 CSCL 06J

The ultraviolet radiation from gas tungsten arc welding (GTAW), gas metal (spray arc) welding (GMAW), and plasma arc cutting (PAC) was measured using a micro-computer controlled rapid scan spectroradiometer. Welding of aluminum alloys containing low concentrations of magnesium were found to yield radiation of considerably greater biological activity than nonmagnesium alloys and, at a distance of one meter from the arc, up to a thousand times that of sunlight at the Earth's surface. Magnesium in small concentrations was found to be important to radiation emission owing to the ease of vaporization into the arc and to the existence of magnesium emissions in the ultraviolet. GMAW emission dependencies on process, shielding gas, gap, and magnesium concentration were determined. Ultraviolet radiation and third octave band noise analyses of PAC were also carried out. Preliminary measurements of welders' clothing transmittance were made. GRA

SAMPLE SIZE DETERMINATIONS FOR SOME RELIABILITY PROBLEMS Ph.D. Thesis
Terry Lee King 1980 71 p
Avail: Univ. Microfilms Order No. 8015809

It is shown that if two or more reliability functions are being considered and these functions are normal or Weibull, then it is not possible to choose one population which has a larger value for the reliability at all values of t. In these cases it is therefore necessary to choose a point, say t^*, at which to draw inferences. Sample sizes are presented for three different settings. In the first setting, sample sizes are given for selecting the population among K normal populations which has the highest reliability at t^*. In the second setting, when a two parameter Weibull distribution is assumed and the experiment is censored on time, the Neyman-Pearson lemma is applied to produce lower bounds on the sample size required to select the most reliable population. In the third setting, again the normal distribution is assumed. Tables giving the power of a one sided hypothesis test are presented for the situation in which the statistic is distributed as a noncentral t random variable under the null and the alternative hypotheses. These tables will aid the experimenter in determining the sample size to be used in an experiment that will result in the construction of a tolerance interval or the variables sampling plan. Dissert. GRAPHICAL TECHNIQUES IN RELIABILITY THEORY Ph.D. Thesis
Bernard Paul Davis 1979 71 p
Avail: Univ. Microfilms Order No. 8014646

The concept of total time on test is extended to the bivariate case. In the one dimensional situation the failure rate function completely describes the aging characteristics of the underlying life distribution. The bivariate analogue of the failure rate function is the hazard gradient. This is a vector-valued function of two variables and jointly, the two functions in the hazard gradient describe the aging as well as dependence characteristics of the underlying bivariate life distribution. The hazard gradient is studied in detail in the context of some general types of dependence. A bivariate form of the total time on test transform is defined and some of its properties are discussed. Its relationship to the hazard gradient is shown to be similar to that of the one dimensional total time on test transform to the failure rate function. The empirical total time on test and the bivariate total time on test plot are discussed and some asymptotic properties of the empirical transform are presented. A bivariate version of the cumulative total time on test statistic is defined and some possible applications to data analysis are discussed. Finally, the structure of the cumulative total time on test statistic is investigated and some distributional results are presented. Dissert. Abstr.

Multicharacteristic quality control is concerned with inspecting the quality of an allotment of items and with monitoring production processes when the quality of an item or the state of a process is determined by a number of observable characteristics. This report reviews procedures currently available for multicharacteristic quality control when the characteristics are either variables or attributes. Attention is given to both location and dispersion parameters in the case of variables. Some limitations of these procedures are noted. GRA

A UNIFIED NUMERICAL APPROACH FOR THERMALLY INDUCED STRESS WAVES Ph.D. Thesis

Hsu-Chao Chen 1979 159 p

Avail: Univ. Microfilms Order No. 8015437

A simple procedure is proposed for modifying an existing computer code to extend its capability to solve problems which involve heat expansions and thermomechanical coupling effects. The procedure is based on a unified variational formulation which introduces the concept of heat displacement and a compatible generalized displacement vector to represent the mechanical response, the thermal response, and their coupling effects. To illustrate the applications of the concept, a plane-stress/plane-strain analysis program was modified and numerically verified examples for uniaxial stress waves, known as the Danilovskaya's problems in thermoelasticity, biaxial stress waves generated by boundary heating or a concentrated heat source were studied. The latter simulates a cutting or a welding problem for thin plates. Numerical data were compared with the analytical solutions are available. Emphasis was focused on the significance of the thermomechanical coupling effects. Dissert. Abstr.

N80-27715 Cornell Univ., Ithaca, N. Y.

INELASTIC ANALYSIS AND DESIGN OF COLD-FORMED STEEL BEAMS WITH STIFFENED COMPRESSION FLANGES Ph.D. Thesis

Muzaffer Yener 1980 403 p

Avail: Univ. Microfilms Order No. 8015753

On the basis of test results on specimens formed from mild structural steel sheets having a yield stress of approximately 37 ksi it is found that ultimate compressive strain mainly depends on: (1) the compression flange slenderness ratio, w/t, and (2) the moment of gradient. A limiting case of moment gradient is defined and beams are divided into two categories. Accordingly, beams subjected to moment gradients higher than the specified limit are classified as members under moment gradient and those with gradients lower than the specific limit as beams under uniform moment. The compressive strain failure criterion is conveniently and conservatively expressed in terms of only one parameter, w/t, for each of the two categories of beams. The failure criterion is verified experimentally for high strength structural steel beams having a yield stress of 56 ksi subjected to moment gradient and uniform moment. In addition, restrictions on the web slenderness ratio, h/t, of sections designed in accordance with the proposed compressive strain failure criterion are provided by modifying the procedure followed in determining such ratios for hot rolled sections. Dissert. Abstr.

N80-27716 Illinois Univ. at Chicago Circle, Chicago.

SERVICEABILITY AND RELIABILITY ANALYSIS OF PARTIALLY PRESTRESSED CONCRETE BEAMS Ph.D. Thesis

Amnuayporn Siriaksorn 1980 495 p

Avail: Univ. Microfilms Order No. 8014233

The serviceability and reliability analysis of partially prestressed concrete beams is addressed. An accurate and rational

method of analysis is developed for partially prestressed concrete beams based on equilibrium, compatibility, and constitutive relations for both the cracked and uncracked sections. Direct equations are derived for the stresses and strains in the materials taking into account the change in the prestressing force due to the application of loads. A design procedure based on satisfying ultimate strength requirements and serviceability criteria is proposed. In addition, a reliability based design model for partially prestressed concrete beams is proposed. It is essentially based on the method called first order second moment which requires the knowledge of only the mean and variance of the distributions of the resistance and load. The reliability index beta of partially prestressed concrete beams at six serviceability limit states is evaluated. The six limit states considered are: maximum crack width, short and long term deflection and fatigue stress ranges in the concrete, the reinforcing steel and the prestressing steel. The effects of many parameters on the observed values of the reliability index beta are analyzed. Dissert. Abstr.

N80-27717 California Univ., Berkeley.
NONLINEAR GEOMETRIC, MATERIAL AND TIME DEPENDENT ANALYSIS OF REINFORCED AND PRESTRESSED CONCRETE SLABS AND PANELS Ph.D. Thesis
Johannes VanGreunen 1979 281 p
Avail: Univ. Microfilms Order No. 8014915

A numerical method of analysis is developed to trace the quasi-static response of reinforced and prestressed concrete slabs and panels under short time and sustained load conditions. Time-dependent effects due to load history, temperature history, creep shrinkage and aging of concrete and stress relaxation in prestressing steel are incorporated. The load-deflection history of such structures through the elastic, inelastic and ultimate ranges is calculated. The ultimate failure of these structures due to in-plane membrane plus bending effects is then predicted considering local failures in steel and concrete along with the deterioration of the structural stiffness due to progressive cracking. A finite element tangent stiffness formulation, coupled with a time step integration scheme, is developed to analyze reinforced and prestressed concrete slab and panel structures. Within a time step, an incremental load procedure with an iterative approach to obtain and equilibrium position of the structure for each load increment, is adopted to trace the nonlinear behavior of such structures. Dissert. Abstr.

N80-27718 California Univ., Los Angeles.
STRUCTURAL AND ACOUSTIC RESPONSE OF SUBMERGED SHELLS OF REVOLUTION Ph.D. Thesis
Allen John Bronowicki 1980 114 p
Avail: Univ. Microfilms Order No. 8015957

A reduction in dimensionality of the problem is achieved through a decomposition of motion into circumferential harmonics. The acoustic relation is thus represented as an integral equation defined along the shell meridian. This relation, derived on the basis of a Green's function technique featuring toroidal wave functions, is applicable to surfaces having arbitrary meridianal shape, including corners. In order to assure uniqueness of solution, interior equations are appended to the set of surface integral equations. The concept of an acoustic element, with meridianal pressure variation determined by the response at a number of surface pressure nodes, is introduced. The structure is represented in terms of an assemblage of conical frustum shell elements having either two or three nodal rings. The capability of representing prestress effects is included in these elements. The fluid-structure interaction relation is consistently developed on the basis of modal degrees of freedom. The final product is an accurate, efficient scheme to predict structural response, and surface and exterior pressure fields. Dissert. Abstr.

N80-27719*# National Aeronautics and Space Administration. Lewis Research Center, Cleveland, Ohio.
COMPARISON OF ELASTIC AND ELASTIC-PLASTIC STRUCTURAL ANALYSES FOR COOLED TURBINE BLADE AIRFOILS
Albert Kaufman Jul. 1980 15 p refs
(NASA-TP-1679; E-241) Avail: NTIS HC A02/MF A01 CSCL 20K

Elastic plastic stress strain states in cooled turbine blade airfoils were calculated by three methods for the initial takeoff transient of an advanced technology aircraft engine. The three analytical methods compared were a three dimensional elastic plastic, finite element analysis, a three dimensional, elastic, finite element analysis, and a one dimensional, elastic plastic, beam theory analysis. Structural analyses were performed for eight cases involving different combinations of mechanical and thermal loading on impingement cooled airfoils with and without leading edge film cooling holes. The von Mises effective total strains at maximum takeoff computed from the elastic and elastic plastic finite element analyses agreed with 9 percent for rotating airfoils and 28 percent for stationary airfoils with the elastic results on the conservative side. DEVELOPMENT AND APPLICATION OF A COMPUTATIONAL SHEAR BAND MODEL Final Report, 7 Apr. 1976 - 7 Apr. 1977
D. C. Erlich, L. Seaman, D. A. Hockey, and D. R. Curran Mar. 1980 123 p refs
(Contract DAAD05-76-C-0762)
(AD-A084029; AD-E430412; ARBRL-CR-00416) Avail: NTIS HC A06/MF A01 CSCL 12/1

A computational shear band model has been developed and used to predict the fragmentation response of explosively-loaded cylinders and munitions. The model is based on the physical processes occurring in the material that lead to fragmentation, as observed in experiments in which the fragmentation process was stopped at various stages of development. Good agreement was obtained between measured and computed fragment size distributions for two widely different steels, which suggests that the model can be used to predict the effects of variation of geometry, strain rate, and internal pressure on the fragmentation yield of munitions. In addition, fragments of long-rod penetrators of steel and a tungsten-7Ni-3Fe alloy were examined metallographically to establish the failure modes. The observations suggest that shear banding is a principal mode of penetrator failure. Computational simulations of a plate impacting on edge another plate at various oblique angles were performed using the two dimensional wave propagation code TROTT with the BFRACT fracture model. The results showed the distribution of shear, compression, and bending stresses in the projectile and indicated the regions where tensile fracture of shear banding might occur. GRA

SURVEYS OF HIGH-PRESSURE EFFECTS IN SOLIDS Final Report, 21 May - 30 Sep. 1979
M. Sparks, L. J. Sham (Univ. of Calif. at La Jolla, San Diego), and M. Ross (Univ. of Calif., Lawrence Livermore Lab., Livermore) Nov. 1979 91 p refs
(Contract MDA903-79-C-0395)
(AD-A083728; PSR-931) Avail: NTIS HC A05/MF A01 CSCL 20/11

The density-functional formalism is used as the framework

within which to assess previous calculations and to suggest new avenues of research. As a result of the study, we judge that significant results should be obtained from theoretical high-pressure-physics investigations at one of three levels of sophistication: the Gordon-Kim-Boyer scheme with our suggested modifications; use of the exchange-correlation potential in the local-density approximation in such an accurate band-structure calculation as the augmented-plane-wave, Korringa-Kohn-Rostoker, or linear-combination-of-muffin-tin-orbital methods; or a complete calculation of the electron dynamics in the local-density approximation, which would also be useful in calculating the phonon spectrum. This approach should yield good results for the equation of state, which is the required basis for studies of dynamic and nonlinear effects, structural transitions in insulators and semiconductors (possibly providing a microscopic understanding of the successful ionicity scale of Phillips), simple insulator-metal transitions, polymorphic transitions in metals, and mixed-valence salt transitions. The state of the art in experimental and theoretical high-pressure physics research is surveyed in the context of recent studies on iodine, xenon, and cesium. Ultrahigh-pressure methods now under development are also reviewed. GRA

(AD-A083871; AD-E440064; ARLCB-TR-80002) Avail: NTIS HC A03/MF A01 CSCL 20/11

Three dimensional elasticity problems are generally complex. In this paper we present the analysis for the stress singularity at the apex of a three dimensional, flat, wedge-shaped crack under general loadings. The problem is reduced to a set of coupled dual integral equations. Because of the complexity they are not amenable to a closed form solution. A variational method is developed to handle such problems. The physical interpretation of the results is also presented. GRA

STRESS INTENSITIES AROUND TRANSVERSE SURFACE FLAWS IN CYLINDRICAL SHELLS BY PHOTOELASTIC STRESS FREEZING

John A. Schaeffel, Jr. 1 Oct. 1979 48 p refs
(AD-A083073; DRSMI/RL-80-1) Avail: NTIS HC A03/MF A01 CSCL 14/5

This report documents a set of seven tests for the determination of K sub I stress intensity factors for isotropic cylinders with transverse part-circular cracks loaded in combined uniaxial extension and internal pressure. Part-circular cracks were machined into birefringent Hysol CP5-4290 photoelastic cylinders. The cylinders were then subjected to combined loading while in a stress freezing cycle. Slices of the cracks were made at various angles and analyzed with a photoelastic polariscope. A least-squares curve fit of the photoelastic data was used to generate K sub I stress intensity factors. K sub I data are plotted versus slice angle into the crack for various crack parameters. The results of the tests were compared with the results of previous tests in which the cylinders were loaded in either pure uniaxial tension or internal pressure. GRA

A BOUNDARY LAYER THEORY FOR THE ANISOTROPIC PLATE Interim Report

R. P. Gilbert and M. Schneider Mar. 1980 29 p refs
(Grant AF-AFOSR-2879-76)
(AD-A083265; AFOSR-80-0297TR; TR-71A) Avail: NTIS HC A03/MF A01 CSCL 20/11

To our knowledge the results of the pioneering paper on the boundary layer theory for plates by K. O. Friedrichs and R. F. Dressler have not been extended to anisotropic plates. Yet the basic conclusion of the above paper, namely that the equations of the three dimensional isotropic elasticity can be split into two independent systems seems to have been accepted by some authors to include also the case of anisotropic elasticity. While this happens to be true it is by no means obvious as the following presentation illustrates; hence, we believe our providing a detailed analysis of the orthotropic plate will be of interest to researchers in the field of composite materials and laminates. GRA

DYNAMIC INSTABILITY OF AN ELASTIC CYLINDRICAL SHELL EXCITED BY A TRANSIENT ACOUSTIC WAVE Interim Report, 14 Nov. 1977 - 12 Jul. 1979

T. L. Geers and C. L. Yen 12 Jul. 1979 61 p refs
(Contract DNA001-78-C-0029)
(AD-A083338; AD-E300740; LMSC/D67676; DNA-5026Z) Avail: NTIS HC A04/MF A01 CSCL 20/11

Governing equations are developed for the dynamic instability of an infinite, elastic, circular cylindrical shell submerged in an infinite fluid medium and excited by a transverse, transient acoustic wave. These equations derive from circumferential Fourier series decomposition of the field quantities appearing in appropriate energy functionals, and from application of the 'residual potential formulation' for rigorous treatment of the fluid-structure interaction. Extensive numerical results are presented that provide understanding of the phenomenology involved and permit evaluation of the 'doubly asymptotic approximation' for treatment of the fluid-structure interaction. PLASTIC DEFORMATION AND DUCTILE FRACTURE AT AN ANGLE SLIT IN A SHEET UNDER TENSION Final Report, 1977 - 1979

S. C. Sanday and O. Richmond (U.S. Steel Research Lab., Monroeville, Pa.) 17 Mar. 1980 20 p refs
(RR0220441)
(AD-A084564; AD-E000409; NRL-8391) Avail: NTIS HC A02/MF A01 CSCL 11/6

A theoretical solution is obtained for the growth of narrow plastic zones and for the initiation of ductile fracture at the ends of an angled slit in a metal sheet under remote uniform tension. The theoretical model assumes two distinct regions: narrow plastic zones at the ends of the slit caused by necking of the sheet, and a surrounding elastic region. The direction of the narrow plastic zones is assumed to be normal to the remote tension regardless of the slit angle. The length of the plastic zones is assumed to be governed by Dugdale's hypotheses of yield stress attainment along the plastic zone-elastic region boundary and continuity of stress at the end of the plastic zone. Finally, fracture initiation is postulated to occur at the ends of the slit when the ratio of slit opening displacement to plate thickness attains a critical value representative of the material ductility. Experimental results on hard-rolled copper sheets support the assumptions and closely match the predicted results. GRA

GEOID ANOMALIES IN THE VICINITY OF SUBDUCTION ZONES

David C. McAdoo May 1980 46 p refs Submitted for publication

(NASA-TM-80678) Avail: NTIS HC A03/MF A01 CSCL 08E

The regional geoid of the southwest Pacific is matched reasonably well by results from a model of the upper mantle density structure (including slabs) associated with subduction zones of the region. Estimates of the geoid are obtained from Geos-3 and Seasat radar altimeter data. These data are very well suited to the task of detecting intermediate wavelength (600-4000 km) geopotential variations. Actually, subducting slabs can be expected to produce primarily intermediate and longer wavelength variations. Gravimetric profiles across trench/island arc complexes resolve primarily short wavelengths. The model represents subducting slabs as thin surfaces of anomalous mass per unit area. These surfaces are positioned using published seismicity results which detail the configuration of the Benioff zones. Crustal effects are ignored. Effects due to the contrast between the young thermal lithosphere of the behind-arc regions (marginal basins) and the older lithosphere seaward of the trench are modelled. Results indicate that the New Hebrides slab possesses an average areal density anomaly of about 300,000 gm/sq cm. This is about three times that which is estimated for the Tonga-Kermadec slab. Additional modelling suggests that slabs worldwide may be an important source of large, long wavelength gravity highs; i.e., they may contribute substantially to geopotential power of harmonic degree as low as three or four up to twenty or more. ATMOSPHERIC MODELS c48
A. Wiin-Nielsen *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 51-62 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

The multitude of atmospheric models presently in existence for purposes of prediction on a regional, hemispheric, and global scale, and for the purpose of simulation of the atmospheric general circulation and climate are briefly described. A global prediction model is considered in detail to illustrate the data requirements for prediction and simulation with a model incorporating energy sources and sinks. The use of atmospheric models in climate research is discussed, illustrating the limitations in various models due to the lack of ability to model the various parts of the climatic system. Author (ESA)

N80-27741# Max-Planck-Institut fuer Meteorologie, Hamburg (West Germany).
STOCHASTIC PROCESSES IN THE ATMOSPHERE-OCEAN SYSTEM c48
K. Herterich *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 63-65 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Examples of stochastic processes in the atmosphere-ocean system are given and their relation to climate is mentioned. In the case of sea surface temperature (SST) anomalies the technique of inverse modeling (a method of fitting models to stochastic data) is described. The results of the modeling lead to a redefinition of the data requirements. For climatic studies the data should be of global coverage and of long duration in time (decades). Specification of data resolution is also considered. Results show that for modeling SST anomalies the necessary resolution is serveral degrees in longitude and latitude, a few weeks for the time step, and 1/10 C for the precision in temperature.

ICE SHEETS, GLACIERS, AND CLIMATE c47
L. Lliboutry *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. Res. (CHARM) from Space Feb. 1980 p 67-71 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Main problems of glacier and ice sheet dynamics are reviewed. A correlation between mass balances and meteorological factors is given. The importance of unusual synoptic situations or unusual sea ice cover in June-July-August is pointed out (e.g., quaternary ice sheets may have started on shallow seas). Results show that the thickness of an ice sheet of given width is much more sensitive to mass balance and air temperatures than often assumed. Spatial geodesy is suggested as useful to check numerical calculations of flow, but can give altitude changes only in some special areas. Author (ESA)

RADIATIVE TRANSFER IN THE CLOUDY AND DUSTY ATMOSPHERE c48
J. Lenoble *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 75-81 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

The transfer of radiation in a scattering atmosphere is briefly reviewed considering the possible approximations and parametrizations. Cloudiness is the main factor governing the planetary radiation balance; climate models should allow for cloud radiation interactions to be properly included. Results are shown concerning the influence of various cloud parameters. Aerosols have a more subtle influence as their role is much weaker, but thier variations can induce local or global climate variations. The need for an improvement in knowledge on aerosol parameters is underlined. Finally, a strategy for both cloud and aerosol radiation studies is proposed. Author (ESA)

ENERGY TRANSPORT IN THE EARTH-ATMOSPHERE SYSTEM AND THE RADIATION BALANCE c48
H.-J. Bolle and P. Speth (Cologne Univ.) *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 83-89 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

The conversion of absorbed short wave energy to infrared radiation emitted to space provides the driving force for large scale transport in the atmosphere-ocean system, which determines the average climate conditions on Earth. The response of the atmosphere and of the oceans to the variations in the energy input is a 'meteorological noise' which generates by interference climate variations. The kind of variability which can be expected depends at least partly on the distribution of energy sources and sinks in the atmosphere-land-ocean-system itself and their variability. The many processes and feedback mechanisms involved are reviewed. As manifestation of the sum of these processes, is the radiation balance at the top of the atmosphere.

SAMPLING PROBLEMS AND RADIATION BUDGETS: DATA REQUIREMENTS [PROBLEMES D'ECHANTILLONAGE ET BILANS RADIATIFS: LEUR PROBLEMATIQUE] **c46**
D. Crommelynck *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 95-102 refs In FRENCH; ENGLISH summary (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

How knowledge of the different radiation budgets with their components is largely dependent on space time sampling of the radiation field of the Earth-atmosphere system is shown. Whichever instrumental approach is adopted (wide angle view or high resolution) it affects the space time integration of the fluxes measured, either directly or as calculated. In this last case, necessary knowledge of the reflection pattern depends, in addition, on the angular sampling of the radiation. A series of questions is considered for which the answers are a prequisite to the organization of a global observation system. Author (ESA)

SATELLITE ALTIMETRY MEASUREMENTS OF THE SEA SURFACE **c43**
T. D. Allan *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 113-120 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Some of the preliminary observations made with the SEASAT precise radar altimeter are reviewed. Examples are taken from recently published work on data from over the western North Atlantic where the dynamic height profiles, calculated from the available geoid model, exhibit not only a strong one to two M signal over the width of the Gulf Stream, but also smaller amplitude anomalies which are associated with mobile cold rings of some 200 km diameter. Examples of repeat profiles recorded during the period of the SEASAT frozen orbit are shown over an area in the eastern Atlantic. They exhibit a remarkable repeatability of small features in the geoid and analysis to detect possible eddies and currents is discussed. A comparison of significant wave heights measured by the altimeter and by a surface buoy is shown to agree to about 20 cm. Author (ESA)

N80-27749# Appleton Lab., Slough (England).
SATELLITE MEASUREMENTS OF ATMOSPHERIC TEMPERATURE **c46**
J. T. Houghton *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 123-127 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

The remote sounding of atmospheric temperature is discussed. Application of this data to the study of variations in atmospheric density is mentioned. A formula to interpret emitted radiation observations at a given spectral frequency in terms of the distribution of temperature throughout the atmosphere is given. The accuracy with which temperature can be measured is evaluated relative to TIROS-N, NOAA 5, and NIMBUS satellite data. Results are compared to data collected by a worldwide radiosonde balloon network. Indications are that good meteorological analyses can be obtained from satellite data alone, also with better coverage of ocean areas. Author (ESA)

N80-27750# Freie Univ., Berlin (West Germany).
THE INTERANNUAL VARIABILITY OF THE STRATOSPHERE **c46**
K. Labitzke *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 129-133 (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Midwinter warmings, circulation anomalies in the stratosphere, are discussed. As an example of the synoptic evolution of such a warming, radiances obtained by Nimbus 6 are given and analyzed. Results confirm that these warmings are forced by the planetary waves of the troposphere. The variability of the planetary waves and of their vertical structure is reflected by the large interannual variability of the stratosphere during the northern winters. It is suggested to monitor this interannual variability, which has not yet been explained, and to measure the vertical temperature distribution of the stratosphere, preferably with the same instrument, continuously over several years. Author (ESA)

N80-27751# National Physical Lab., Teddington (England).
COMPOSITION OF THE MIDDLE ATMOSPHERE: STATUS AND PRIORITIES **c46**
J. E. Harries *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 135-142 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

A brief review of the current status of knowledge of middle atmosphere composition is given. The importance of coupling between photochemistry, dynamics, and radiation is stressed. A list of outstanding scientific problems is given, and some priorities for future research using satellites are established. Author (ESA)

WATER VAPOR IN THE UPPER TROPOSPHERE AND IN THE STRATOSPHERE **c46**
H. Fischer *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 153-159 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Knowledge of the global water vapor distribution and its seasonal changes in the upper troposphere and stratosphere is reviewed. The circulation of water vapor and the exchange processes between troposphere and stratosphere are emphasized in terms of contributions from satellite observation. In contrast to known mean water vapor distributions in the upper troposphere, only single measurements of the mixing ratio have been published for the stratosphere so that the theory about the stratospheric water vapor cycle cannot yet be confirmed. Although expected results of two limb sounding experiments aboard Nimbus 7 will yield new information, recommendations for future improved satellite systems are offered. Author (ESA)

METHODS AND PROBLEMS IN SATELLITE TEMPERATURE PROFILES AND WINDS **c47**
B. Bizzari *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 173-182 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Analysis methods to determine vertical temperature profiles as well as wind parameters from satellite data are reviewed. Emphasis is on instrumentation shortcomings as revealed by theoretical considerations. Problems are ranked according to their limiting effect on analysis accuracy. Some methods containing loose assumptions relating to calculations are identified as being readily corrected by a more careful use of data. Other difficulties of a technical nature, such as cloud interference with readings, vertical resolution in sounding, or height attribution in winds, are seen as necessitating further developments in measurement technology. D. A. Flower and G. E. Peckham *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 189-192 refs Sponsored jointly with UK Science Research Council Prepared jointly with Heriot-Watt Univ., Edinburgh (For primary document see N80-27733 18-42)
(Contract NAS7-100)
Avail: NTIS HC A10/MF A01 CSCL 04B

An instrument to measure atmospheric pressure at the Earth's surface from an orbiting satellite is considered. Surface pressure can be deduced from measurements of the transmission of an atmospheric column at several frequencies at the edges of the 60 GHz oxygen absorption band. An active microwave instrument proposed to make these measurements is the subject of a joint UK-US development program to demonstrate its capabilities. The results of an extensive analysis of the potential performance of the instrument are summarized. Author (ESA)

GLOBAL WIND DETERMINATION BY INTERFEROMETRIC TECHNIQUES IN THE TROPOSPHERE, STRATOSPHERE AND MESOSPHERE **c47**
D. Rees *In* ESA On Climatol., Hydrol., Atmospheric Res. and Meteorol. (CHARM) from Space Feb. 1980 p 193-206 refs (For primary document see N80-27733 18-42)
Avail: NTIS HC A10/MF A01

Remote sensing of atmospheric winds from the middle troposphere to the thermosphere on a global basis by means of a single instrument mounted on a low altitude, polar orbiting spacecraft is discussed. Factors of the instrument design, such as aperture and thermal stability, and of the spacecraft performance, particularly attitude control and measurement, are shown to be the major constraints affecting the accuracy of wind profile reconstruction and the obtainable spatial resolution. Given the practical possibilities offered by prospective missions, such as the NASA Upper Atmosphere Research Satellite (UARS) Program and the ESA/NASA shuttle/Spacelab missions, a target accuracy of 3 m/sec combined with a horizontal resolution of 100 to 200 km can be achieved with an altitude resolution of 3 km (up to 20 km) or 5 km (up to 70 km). The rapidity with which global wind data can be reconstructed and made available for meteorological purposes is mainly dependent on the stability and absolute accuracy of the spacecraft attitude control system. THE EVALUATION OF A METHODOLOGY TO MEASURE MANUAL DIGITIZING ERROR IN CARTOGRAPHIC DATA BASES Ph.D. Thesis
Charles Tim Traylor 1979 122 p
Avail: Univ. Microfilms Order No. 8014441

Four hypotheses were tested: (1) that digitizing error is a nonrandom phenomenon; (2) that individual subjects make systematic errors that are related to the direction of motion of

the hands and arms; (3) that similar directional errors occur across the entire subject population; and (4) that individual digitizing performance can be improved through a program of training using specially designed feedback. The procedure involved the arithmetic comparison of two digital files, one representing the X-Y coordinates of a test shape, and the other representing sample responses from subjects digitizing the shape. Fifteen subjects were tested to establish the general patterns of error, and one subject was tested to establish that this new information might be used in a training program to reduce the errors. The results indicated that direction of motion was a contributing factor to the overall error pattern of a digitizer operator, and that the error pattern can be modeled. Also, the digitizing error was found to be a nonrandom phenomenon. The training program indicated that knowledge of the error pattern could lead to decreased error. Dissert. Abstr.

THE BOUNDARY INTEGRAL EQUATION METHOD APPLIED TO FREE SURFACE FLOW PROBLEMS IN POROUS MEDIA Ph.D. Thesis
Gerard Patrick Lennon 1980 179 p
Avail: Univ. Microfilms Order No. 8015700

The boundary integral equation method (BIEM) is an efficient numerical method which can be employed to solve a wide variety of applied engineering problems because all computations are performed on the boundary of the region of interest rather than throughout the solution domain. The method is restricted to rather simple partial differential equations with a known Green's function. For transient problems, the BIEM can be used in conjuction with a time-stepping procedure to obtain solutions without iteration. For steady-state problems, part of the boundary data are applied on the steady-state free surface; however, because the location of the free surface is part of the problem, the problem cannot be solved unless the location of the free surface is know. The BIEM uses an efficient iteration scheme to locate the steady-state surface. Problems considered include the rise of water table resulting from the application of fluid recharge, steady-state axisymmetric flow towards a fully penetrating pumping well in an unconfined aquifer, and the steady-state flow from a pond towards a water table. Dissert. Abstr.

STATISTICAL INVESTIGATION OF THE PROPAGATION OF RANDOM AND NON-RANDOM ERRORS IN BLOCK AEROTRIANGULATION SYSTEMS Ph.D. Thesis
Clement Changyun Lee 1979 323 p
Avail: Univ. Microfilms Order No. 8014773

Three block aerotriangulation techniques including bundle adjustment, independent models, and polynomials were utilized. The computer programs for simulating various types of data blocks and for fully analytical block adjustments containing error propagation capability were developed and used with simulated data blocks. Results indicate that simulated photogrammetric data provide a very effective method for studying individual and compound error propagation in analytical aerotriangulation systems. The study shows that the propagated errors of exterior orientation parameters are not suitable for distinguishing random or nonrandom errors. On the basis of statistical tests, the bundle method provides more accurate results than adjustment with independent models or by polynomials. On the other hand, the bundle adjustment with addition parameters indicates that this procedure is a very effective technique for compensation of uncorrected nonrandom errors. However, the image coordinates refinement technique is still very useful, and should be applied. Dissert. Abstr.

A COMPARISON OF RADIATIVE TRANSFER MODELS FOR PREDICTING THE MICROWAVE EMISSION FROM SOILS
T. J. Schmugge (Computer Sciences Corp., Silver Spring, Md.) and B. J. Choudhury May 1980 32 p refs Submitted for publication
(NASA-TM-80688; G-F4504) Avail: NTIS HC A03/MF A01 CSCL 08M

Two general types of numerical models for predicting microwave emission from soils are compared-coherent and noncoherent. In the former, radiation in the soil is treated coherently, and the boundary conditions on the electric fields across the layer boundaries are used to calculate the radiation intensity. In the latter, the radiation is assumed to be noncoherent, and the intensities of the radiation are considered directly. The results of the two approaches may be different because of the effects of interference, which can cause the transmitted intensity at the surface (i.e., emissivity) to be sometimes higher and sometimes lower for the coherent case than for the noncoherent case, depending on the relative phases of reflected fields from the lower layers. This coupling between soil layers in the coherent models leads to greater soil moisture sampling depths observed with this type of model, and is the major difference that is found between the two types of models. In noncoherent models, the emissivity is determined by the dielectric constraint at the air/soil interface. The subsequent differences in the results are functions of both the frequency of the radiation being considered and the steepness of the moisture gradient near the surface. The calculations were performed at frequencies of 1.4 and 19.4 GHz and for two sets of soil profiles. Little difference was observed between the models at 19.4 GHz; and only at the lower frequency were differences apparent because of the greater soil moisture sampling depth at this frequency. Author

SNOWPACK MONITORING IN NORTH AMERICA AND EURASIA USING PASSIVE MICROWAVE SATELLITE DATA
J. L. Foster, A. Rango, and D. K. Hall [1980] 23 p refs Submitted for publication
(NASA-TM-80706) Avail: NTIS HC A02/MF A01 CSCL 08L

Areas of the Canadian high plains, the Montana and North Dakota high plains, and the steppes of central Russia were studied in an effort to determine the utility of spaceborne electrical scanning microwave radiometers (ESMR) for monitoring snow depths in different geographic areas. Significant regression relationships between snow depth and microwave brightness temperatures were developed for each of these homogeneous areas. In the areas investigated, Nimbus 6 (.081 cm) ESMR data produced higher correlations than Nimbus 5 (1.55 cm) ESMR data in relating microwave brightness temperature and snow depth from one area to another because different geographic areas are likely to have different snowpack conditions. REMOTE SENSING OF SOIL MOISTURE CONTENT OVER BARE FIELDS AT 1.4 GHz FREQUENCY

J. R. Wang and B. J. Choudhury (Computer Sciences Corp., Silver Spring, Md.) Jun. 1980 26 p refs Submitted for publication

(NASA-TM-80711) Avail: NTIS HC A03/MF A01 CSCL 08M

A simple method of estimating moisture content (W) of a bare soil from the observed brightness temperature (T sub B) at 1.4 GHz is discussed. The method is based on a radiative transfer model calculation, which has been successfully used in the past to account for many observational results, with some modifications to take into account the effect of surface roughness. Besides the measured T sub B's, the three additional inputs required by the method are the effective soil thermodynamic temperature, the precise relation between W and the smooth field brightness temperature T sub B and a parameter specifying the surface roughness characteristics. The soil effective temperature can be readily measured and the procedures of estimating surface roughness parameter and obtaining the relation between W and smooth field brightness temperature are discussed in detail. Dual polarized radiometric measurements at an off-nadir incident angle are sufficient to estimate both surface roughness parameter and W, provided that the relation between W and smooth field brightness temperature at the same angle is known. The method of W estimate is demonstrated with two sets of experimental data, one from a controlled field experiment by a mobile tower and the other, from aircraft overflight. The results from both data sets are encouraging when the estimated W's are compared with the acquired ground truth of W's in the top 2 cm layer. An offset between the estimated and the measured W's exists in the results of the analyses, but that can be accounted for by the presently poor knowledge of the relationship between W and smooth field brightness temperature for various types of soils. An approach to quantify this relationship for different soils and thus improve the method of W estimate is suggested.

AIRBORNE LASER TOPOGRAPHIC MAPPING RESULTS FROM INITIAL JOINT NASA/US ARMY CORPS OF ENGINEERS EXPERIMENT

W. B. Krabill, J. G. Collins (Army Corps of Engineers, Vicksburg, Miss.), R. N. Swift (EG and G Washington Analytical Services Center, Inc., Pocomoke City, Md.), and M. L. Butler (EG and G Washington Analytical Services Center, Inc., Pocomoke City, Md.) Jun. 1980 36 p

(NASA-TM-73287) Avail: NTIS HC A03/MF A01 CSCL 08B

Initial results from a series of joint NASA/US Army Corps of Engineers experiments are presented. The NASA Airborne Oceanographic Lidar (AOL) was exercised over various terrain conditions, collecting both profile and scan data from which river basin cross sections are extracted. Comparisons of the laser data with both photogrammetry and ground surveys are made, with 12 to 27 cm agreement observed over open ground. Foliage penetration tests, utilizing the unique time-waveform sampling capability of the AOL, indicate 50 cm agreement with photogrammetry (known to have difficulty in foliage covered terrain).

RESEARCH ON THE HYDROLOGY AND WATER QUALITY OF WATERSHEDS SUBJECTED TO SURFACE MINING. PHASE 1: PREMINING HYDROLOGIC AND WATER QUALITY CONDITIONS Summary Report, 22 Jan. 1976 - 22 Jan. 1978

Gary E. McIntosh and W. R. Harmon 22 Dec. 1979 35 p Prepared in cooperation with Science and Education Administration, Coshocton, Ohio

(Contracts DI-BM-J0-166054; DI-BM-J0-166055)

(PB80-159510: BM-OFR-31-80) Avail: NTIS HC A03/MF A01 CSCL 08H

Five watersheds, ranging in size from 29 to 52 acres, were selected in east-central Ohio for the purpose of investigating the hydrologic and water quality conditions occuring before, during, and after surface mining. The average concentrations of the water quality parameters for all watersheds were as low or lower than the Environmental Protection Agency recommended maximum allowable concentrations in drinking water except for suspended solids. Before mining the average concentration of suspended solids in storm runoff ranged from 118 to 1,100 micrograms/1, and for base flow the range was from 44 to 247 micrograms/1; the higher concentrations were associated with the watersheds exhibiting the greatest premining disturbance. Iron ranged from an average of less than 3 to 228 micrograms/1. Manganese ranged from less than 41 to 334 micrograms/1. Premining ground water systems for each watershed had two major perched aquifers within the top 205 ft.

DEVELOPMENT OF DATA ENHANCEMENT AND DISPLAY TECHNIQUES FOR STREAM-SEDIMENT DATA COLLECTED IN THE NATIONAL URANIUM RESOURCE EVALUATION PROGRAM OF THE UNITED STATES DEPARTMENT OF ENERGY

G. S. Koch, Jr. (Georgia Univ., Athens), R. J. Howarth (Imperial Coll., London), R. H. Carpenter (Georgia Univ., Athens), and J. H. Schvenemeyer (Delaware Univ.) Athens, Ga. Georgia Univ. Aug. 1979 236 p refs

(Contract EY-76-C-13-1664)

(GJBX-28(80)) Avail: NTIS HC A11/MF A01

Statistical, mapping, and geological techniques were combined in order to evaluate and appropriately display geochemical data for the identification of uranium associated halos utilizing the NURE hydrogeochemical and stream sediment reconnaissance data base. A set of computer-based procedures implemented in a time-sharing interactive mode on a Control Data Corporation Cyber 70 and 174 computer was developed. Techniques of data analysis are developed. Results of the data analysis for the

Southeastern area, Seguin quadrangle, and Pueblo quadrangle are presented. Conclusions are drawn and recommendations are stated. DOE

THE DEVELOPMENT OF PALIS: A PONDS AND LAKES INFORMATION SYSTEM FOR MASSACHUSETTS
Paul J. Godfrey, Spencer A. Joyner, Jr., Edward L. Goldstein, and Linda Ross Dec. 1979 254 p
(Contract DI-14-34-0001-9023)
(PB80-156979; Pub-108; W80-03902; OWRT-A-124-MASS(1)) Avail: NTIS HC A12/MF A01 CSCL 08H

A state-of-the-art information system for managing ponds and lakes resources at the state level was accomplished for Massachusetts by (1) assessing the quality and quantity of existing ponds and lakes information, (2) surveying the state of the art of computerized management information systems including water resources information systems, (3) evaluating the implications for state agencies of computerizing in a single system all the ponds and lakes information they already possess and (4) designing a management information system for Massachusetts ponds and lakes information. This design included the creation of a complex data base structure which was suited to existing computer software packages, and the development of a functioning pilot demonstration system based on state agency for 20 lakes and ponds. GROUND-WATER RESOURCES AND MODEL APPLICATIONS FOR THE EDWARDS (BALCONES FAULT ZONE) AQUIFER IN THE SAN ANTONIO REGION, TEXAS
Glenward R. Elder, William B. Klemt, Tommy R. Knowles, and Thomas W. Sieh Oct. 1979 96 p refs
(PB80-157332; TDWR/R-239) Avail: NTIS HC A05/MF A01 CSCL 08H

The occurrence, availability, and dependability of the Edwards Aquifer in the Nueces, San Antonio, Guadalupe-Blanco River basins was determined in order to develop a ground water resources management tool for use in a total water-resource management program for the three river basins. The quantitative aspects of ground-water withdrawals, spring flows, and aquifer characteristics were of particular interest. Test wells were drilled: (1) to describe the lithology of the stratigraphic units which make up the Edwards (Balcones Fault Zone) aquifer; (2) to determine the upper and lower hydrologic boundaries; (3) to determine the average total porosity for various aquifer levels; and (4) to determine the average effective porosity (specific yield) and the approximate artesian storage values for the aquifer through core analysis. GEOPHYSICAL AND HYDROLOGIC PREDICTION OF FISSURING AND LAND SUBSIDENCE, SOUTH-CENTRAL ARIZONA
J. S. Sumner and F. J. Christie Mar. 1980 9 p refs
(Contracts DI-14-34-0001-7005; DI-14-34-0001-7006)
(PB80-159908; W80-04013; OWRT-A-073-ARIZ(3)) Avail: NTIS HC A02/MF A01 CSCL 08G

The gravity exploration method was employed to survey the Picacho basin area in south-central Arizona where numerous fissures are located and where the land has subsided in excess of 12.5 feet (3.96 m) since 1952. A differential subsidence concept would predict that vertical offset fissures would most likely occur over basement irregularities. Therefore, the gravity data were interpreted in terms of the probable variation in thickness of alluvium overlying the more dense bedrock. Modeling of the bedrock surface under the basin area reveals a strong correlation between gravity gradients and earth fissures. It can be concluded that most vertical offset earth fissures are related bedrock irregularities, and that the gravity method holds promise in predicting the probable occurrence of these features. DEWATERING SYSTEMS FOR SURFACE COAL MINES Final Report, Sep. 1977 - Dec. 1979
J. E. ORourke and K. OConnor 21 Dec. 1979 260 p refs
(Contract DI-BM-JO-275025)
(PB80-160153; BM-OFR-32-80) Avail: NTIS HC A12/MF A01 CSCL 08I

Available dewatering technology is assessed and its relevance to surface coal mines in the interior province of the United States is evaluated. Guidelines for the selection, design, and construction of dewatering systems are included. On the basis of documented experience, candidate dewatering systems were selected and evaluated with respect to their anticipated impact on the environment and mine operations. Laws and regulations that can impact on dewatering operations are summarized. Geologic and hydrogeologic conditions within the interior province are described and potential dewatering problems at surface coal mines are identified. Model mines are developed that exhibit the most difficult dewatering problems identified, and it is demonstrated how available technology can be utilized to deal with them. GRA

SONAR PROBING AS A MINING AND TUNNELING TOOL Progress Report, 21 Dec. 1978 - 30 Sep. 1979
Robert R. Unterberger 30 Sep. 1979 95 p refs
(Grant NSF APR-76-21764)
(PB80-159239; NSF/RA-790255) Avail: NTIS HC A05/MF A01 CSCL 08I

To avoid multiple signals which are difficult to interpret, a narrow beam is produced in rock salt to determine the azimuth and elevation of the various targets seen in time. A high frequency transducer is driven to two frequencies that causes the salt itself to go nonlinear and generate the difference frequency which is comparable to that of the high frequency beam. It is believed that this breakthrough could drastically improve the ability of the sonar probing system to discriminate reflected signals in salt in azimuth and elevation. Unsuccessful experiments on attenuation measurements of sound in salt are described, as well as successful tests, to improve the signal to noise ratio of the signals reflected from discontinuities in the salt. Measurements on the amount of noise in salt as a function of frequency are briefly discussed. GRA

FUTURE US PHOSPHORUS LOADINGS TO THE GREAT LAKES: AN INTEGRATION OF WATER QUALITY MANAGEMENT PLANNING INFORMATION Final Report
Thomas M. Heidtke, Timothy J. Monteith, Rose Ann Sullivan, Douglas J. Scheflow, and William E. Skimin Oct. 1979 75 p refs Sponsored in part by Water Resources Council
(PB80-160336; GLBC/GLEPS-11) Avail: NTIS HC A04/MF A01 CSCL 08H

Information derived from individual water quality management plans was aggregated to generate projections of U.S. total phosphorus loads to the Great Lakes. Computer simulation techniques were then used to evaluate and compare the cost-effectiveness of alternatives for controlling phosphorus inputs from municipal point sources and land drainage. The results reveal that reduction of municipal wastewater effluent concentrations to meet a 1 mg/l total phosphorus limitation represents the most critical step in controlling future loadings, in terms of both cost-effectiveness and net reduction in annual input to the Great Lakes. Implementation of this control measure will result in almost a 60 percent reduction in the U.S. municipal input between the mid 1970's and the year 1990. Although population growth will result in a gradual increase in the load between the years 1990 and 2000, the municipal input will remain well below mid-1970 levels. GRA

OPTIONS TO IMPROVE FEDERAL NONSTRUCTURAL RESPONSE TO FLOODS
Rutherford H. Platt (Massachusetts Univ., Amherst) 1 Dec. 1979 141 p refs Sponsored in part by President's Committee on Water Policy
(PB80-160146) Avail: NTIS HC A07/MF A01 CSCL 08H

Federal response to floods at present is fragmented by agency, by objective, by authority, and by mode of cost sharing. Various programs rehabilitate private victims through grants, loans, and tax subsidies. Other programs address community restoration

through the restoration of structures, debris clearance, repair of flood controls, and emergency livestock feeding. Methods for reducing the suscestibilities of properties and lives to future losses are discussed with emphasis on cooperation with local governments and agencies. Topics covered include flood plain regulation, land acquisition, flood proofing, and flood insurance. A.R.H.

INVENTORY OF SNOW COVER AND SEA ICE DATA
R. G. Crane, comp. Dec. 1979 166 p
(PB80-164007; GD-7; NOAA-80022901) Avail: NTIS HC A08/MF A01 CSCL 08L

Snow cover and sea ice data were surveyed with emphasis on map series or data sets which characterize these two cryospheric parameters on a regional to global scale. Such information is of broad relevance to problems of global climate, hydrology, and environmental monitoring, as well as for operational and planning purposes in conjunction with engineering projects, transportation, agriculture, and energy assessments. The present inventory is primarily concerned with sets of large-scale snow cover data. A summary of data available from the State Snow Surveys and from a few of the regional-scale operational and experimental snow cover data sets is included. Some national data sets from non-U.S. sources are also described. The inventory of sea ice data sources focuses on mapped information relating to the seasonal cycle. GRA

(PB80-157662; NSF/RA-790175) Avail: NTIS HC A04/MF A01 CSCL 10A

The management and uses of marine resources are considered including current and potential developments in ocean farming which utilize the giant kelp (Macrocystis pyrifera). This rapidly growing species may be converted anaerobically into substitute natural gas and additionally produce enormous quantities of minerals, fertilizers, and livestock and human feed. It also enhances local fish crops. Preliminary cost estimates show this process of gas production to be competitive with alternate gas supply sources. Some of the technical and economic factors of ocean farming are discussed as well as methods for obtaining chemicals from a northern kelp. Books and papers received, grants awarded by NSF, DOE, and USDA, pertinent patents, NTIS publications, research announcements, and future meetings are listed. GRA

CURRENT CONDUCTION MECHANISM AND DESIGN OPTIMIZATION STUDY OF MIS SOLAR CELLS Ph.D. Thesis
Kamal Rajkanan 1980 384 p
Avail: Univ. Microfilms Order No. 8016237

The current conduction mechanism studies are related to the design optimization problems in MIS solar cells. Specifically, a SiO-Cu-Cr-SiO2-(p)Si-Al structure on both single and polycrystalline silicon was used. The current conduction mechanisms in these MIS solar cells were determined by studying the dark and solar characteristics over a wide range of temperature. It was shown that the current can be either diffusion limited, tunnel limited or space charge limited, depending on the design and the surface conditions. Band to band tunneling and the tunneling via surface states were identified. Based on experimentally determined current conduction mechanisms, a simulation model was developed which considers the total design of the real world MIS solar cell. The simulated results are shown to agree with the experimental data on the actual devices. The simulation model was used to determine the loss mechanisms in these solar cells. The sensitivity of device performance with different design variables was determined, thus establishing overall design guidelines for fabricating high efficiency MIS solar cells. Dissert. Abstr.

CHEMICAL, STRUCTURAL AND OPTICAL CHARACTERIZATION OF A BLACK CHROME SOLAR SELECTIVE ABSORBER Ph.D. Thesis
Carl Matthew Lampert 1979 170 p
Avail: Univ. Microfilms Order No. 8014770

The very popular black chrome coating, Harshaw Chemical's 'Chromonyx' was analyzed in terms of materials science to determine the nature of its microstructure and the relationship to wavelength selectivity. This coating serves as an efficient solar thermal conversion coating for both concentrating and flat plate solar collectors. Principally, energy dispersive X-ray analysis as well as scanning and transmission electron microscopy were employed for thin film analysis. A wide range of experiments were performed to correlate both the as-plated and annealed microstructure to reflectance measurements. Along with supplemental information on Auger and XPS depth profiling from other investigators, it was possible to develop a physical metallurgical model for the wavelength selectivity properties of this coating. Microstructural analysis was performed on 1 - 100 hour annealed specimens over the temperature range of 300-600 C, in atmospheres of air and medium vacuum. Black chrome solar selectivity degrades by the nucleation and growth of Cr2O3 particles. These particles alter the absorptive properties of the coating by depleting and redistributing metallic chromium. The coating also emanates CO and CO2 which may break up the coating, enhancing oxidation. At high temperatures above

500 C this coating appears densified and totally oxidized. It is suggested that this black chrome degrades by a simple diffusion controlled oxidation mechanism. Dissert. Abstr.

PHOTOVOLTAIC PROPERTIES OF METAL-MEROCYANINE-TiO2 SANDWICH CELLS Ph.D. Thesis
Terje Asbjorn Skotheim 1979 147 p
Avail: Univ. Microfilms Order No. 8014882

Photocurrent generation in thin films of merocyanine photosensitizing dyes sandwiched between an n-type semiconductor and a metal overlayer was studied using photovoltaic techniques. In the system analyzed in detail TiO2 single crystal, doped n-type, was used as the semiconductor and a semitransparent Au film as a metal overlayer. A comprehensive theoretical model was developed to explain the observed photovoltaic properties. The model assumes that the principal route for the formation of charge carriers is via singlet excitons diffusing to the merocyanine TiO2 interface followed by dissociation of the excitons into electron-hole pairs, the electrons being injected into the TiO2 conduction band and the holes into the merocyanine. The model also incorporates field dependence of the quantum efficiency for charge generation and is strongly supported by a variety of steady state and kinetic measurements. An exciton diffusion length of 79 angstroms was determined by analyzing the short circuit action spectra using the theoretical model developed. Dissert. Abstr.

ENGINEERING TEST FACILITY DESIGN DEFINITION
R. W. Bercaw and G. R. Seikel 20 Jun. 1980 16 p refs
Presented at 7th Intern. Conf. on Magnetohydrodynamic Elect. Power Generation, Cambridge, Mass., 16-20 Jun. 1980; sponsored by Symp. on the Eng. Aspects of Magnetohydrodynamics, Inc.
(Contract EF-77-A-01-2674)
(NASA-TM-81499; DOE/NASA/2674-11; E-436) Avail: NTIS HC A02/MF A01 CSCL 10A

The Engineering Test Facility (ETF) is the major focus of the Department of Energy (DOE) Magnetohydrodynamics (MHD) Program to facilitie commercialization and to demonstrate the commercial operability of MHD/steam electric power. The ETF will be a fully integrated commercial prototype MHD power plant with a nominal output of 200 MW sub e. Performance of this plant is expected to meet or surpass existing utility standards for fuel, maintenance, and operating costs; plant availability; load following; safety; and durability. It is expected to meet all applicable environmental regulations. The current design concept conforming to the general definition, the basis for its selection, and the process which will be followed in further defining and updating the conceptual design. Author

SOLID POLYMER ELECTROLYTE FUEL CELL TECHNOLOGY PROGRAM Final Report
31 May 1980 53 p refs
(Contract NAS9-15286)
(NASA-CR-160734; TPR-77) Avail: NTIS HC A04/MF A01 CSCL 10A

Work is reported on phase 5 of the Solid Polymer Electrolyte (SPE) Fuel Cell Technology Development program. The SPE fuel cell life and performance was established at temperatures, pressures, and current densities significantly higher than those previously demonstrated in sub-scale hardware. Operation of single-cell Buildup No. 1 to establish life capabilities of the full-scale hardware was continued. A multi-cell full-scale unit (Buildup No. 2) was designed, fabricated, and test evaluated laying the groundwork for the construction of a reactor stack. A reactor stack was then designed, fabricated, and successfully test-evaluated to demonstrate the readiness of SPE fuel cell technology for future space applications. R.E.S.

SOLAR ENERGY SYSTEM PERFORMANCE EVALUATION: SEASONAL REPORT FOR CONTEMPORARY-MANCHESTER, MANCHESTER, NEW HAMPSHIRE Progress Report, Mar. 1979 - Feb. 1980
30 Jul. 1980 80 p Sponsored in part by DOE
(Contract NAS8-32036)
(NASA-CR-161471) Avail: NTIS HC A05/MF A01 CSCL 10A

The operational and thermal performance of the solar energy system, Contemporary-Manchester, is described. The system was designed by Contemporary Systems Incorporated to provide space heating and domestic hot water preheating for a three story dwelling located on the New Hampshire Vocational Technical College campus, Manchester, New Hampshire. The net fossil energy savings for the period from March, 1979 to February, 1980 was 14.52 million Btu. However, the performance of the system must be degraded due to the fact that the building was unoccupied throughout the data assessment and analysis period. The unoccupied status prevented the normal adjustment of heating and ventilating controls for maintenance of comfort levels within the building. This lack of occupancy also prevented the typical family hot water usage, which would have allowed for more realistic evaluation of the hot water subsystem. R.E.S.

FEASIBILITY STUDY OF AILERON AND SPOILER CONTROL SYSTEMS FOR LARGE HORIZONTAL AXIS WIND TURBINES Final Report
W. H. Wentz, Jr., M. H. Snyder, and J. T. Calhoun May 1980 69 p refs
(Grant NsG-3277; Contract EX-76-I-01-1028)
(NASA-CR-159856; DOE/NASA/3277-1; WER-10) Avail: NTIS HC A04/MF A01 CSCL 10A

The feasibility of using aileron or spoiler controls as alternates to pitch control for large horizontal axis wind turbines was studied. The NASA Mod-0 100 kw machine was used as the basis for the study. Specific performance studies were conducted for 20% chord ailerons over the outboard 30% span, and for 10% chord spoilers over the same portion of the span. Both control systems utilized control deflections up to 60 deg. Results of the study show that either ailerons or spoilers can provide the control necessary to limit turbine power in high wind conditions. The aileron system, as designed, provides overspeed protection at hurricane wind speeds, low wind speed starting torque of 778 N-m (574 ft. lb) at 3.6 m/sec, and a 1.3 to 1.5% increase in annual energy compared to a fixed pitch rotor. The aileron control system preliminary design study includes aileron loads analysis and the design of a failsafe flyweight actuator for overspeed protection in the event of a hydraulic system failure. L.F.M.

EFFECT ON COMBINED CYCLE EFFICIENCY OF STACK GAS TEMPERATURE CONSTRAINTS TO AVOID ACID CORROSION Final Report
Joseph J. Nainiger Jul. 1980 16 p refs
(Contract EF-77-A-01-2593)
(NASA-TM-81531; DOE/NASA/2593-17; E-483) Avail: NTIS HC A02/MF A01 CSCL 10B

To avoid condensation of sulfuric acid in the gas turbine exhaust when burning fuel oils containing sulfur, the exhaust stack temperature and cold-end heat exchanger surfaces must be kept above the condensation temperature. Raising the exhaust

stack temperature, however, results in lower combined cycle efficiency compared to that achievable by a combined cycle burning a sulfur-free fuel. The maximum difference in efficiency between the use of sulfur-free and fuels containing 0.8 percent sulfur is found to be less than one percentage point. The effect of using a ceramic thermal barrier coating (TBC) and a fuel containing sulfur is also evaluated. The combined-cycle efficiency gain using a TBC with a fuel containing sulfur compared to a sulfur-free fuel without TBC is 0.6 to 1.0 percentage points with air-cooled gas turbines and 1.6 to 1.8 percentage points with water-cooled gas turbines. IMPACT OF PROPULSION SYSTEM R AND D ON ELECTRIC VEHICLE PERFORMANCE AND COST
Harvey J. Schwartz and Andrew L. Gordan 22 May 1980 16 p refs Presented at 3d Intern. Electric Vehicle Exposition and Conf., St. Louis, 20-22 May 1980
(Contract EC-77-A-31-1044)
(NASA-TM-81548; DOE/NASA/1044-9; E-504) Avail: NTIS HC A02/MF A01 CSCL 10B

The efficiency, weight, and manufacturing cost of the propulsion subsystem (motor, motor controller, transmission, and differential, but excluding the battery) are major factors in the purchase price and cost of ownership of a traffic-compatible electric vehicle. The relative impact of each was studied, and the conclusions reached are that propulsion system technology advances can result in a major reduction of the sticker price of an electric vehicle and a smaller, but significant, reduction in overall cost of ownership. SOLAR ENERGY SYSTEM PERFORMANCE EVALUATION-SEASONAL REPORT FOR ELCAM SAN DIEGO, SAN DIEGO, CALIFORNIA Progress Report, Mar. - Sep. 1979
May 1980 71 p refs Sponsored in part by DOE
(Contract NAS8-32036)
(NASA-CR-161481) Avail: NTIS HC A04/MF A01 CSCL 10A

The solar energy system, Elcam San Diego, was designed to supply domestic hot water heating for a single family residence located in Encinitas, California. System description, performance assessment, operating energy, energy savings, maintenance, and conclusions are presented. The system is a 'Sunspot' two tank cascade type, where solar energy is supplied to either a 66 gallon preheat tank (solar storage) or a 40 gallon domestic hot water tank. Water is pumped directly from one of the two tanks, through the 65 square feet collector array and back into the same tank. Freeze protection is provided by automatically circulating hot water from the hot water tank through the collectors and exposed plumbing when freezing conditions exist. Auxiliary energy is supplied by natural gas. Analysis is based on instrumented system data monitored and collected for one full season of operation. L.F.M.

SCREEN PRINTING TECHNOLOGY APPLIED TO SILICON SOLAR CELL FABRICATION Final Report, Nov. 1977 - Feb. 1979
Jay W. Thornhill and William E. Sipperly Apr. 1980 64 p refs
(Contract NAS3-20826)
(NASA-CR-159789) Avail: NTIS HC A04/MF A01 CSCL 10A

The process for producing space qualified solar cells in both the conventional and wraparound configuration using screen printing techniques was investigated. Process modifications were chosen that could be easily automated or mechanized. Work was accomplished to optimize the tradeoffs associated with gridline spacing, gridline definition and junction depth. An extensive search for possible front contact metallization was completed. The back surface field structures along with the screen printed back contacts were optimized to produce open circuit voltages of at least an average of 600 millivolts. After all intended modifications on the process sequence were accomplished, the cells were exhaustively tested. Electrical tests at AMO and 28 C were made before and after boiling water immersion, thermal shock, and storage under conditions of high temperature and high humidity. L.F.M.

A 2500 megawatt solid ground output Solar Power Satellite (SPS) of conventional configuration was designed and analyzed. Because the power per receiving antenna is halved, as compared

with the klystron reference, twice the number of receiving antennas are needed to deliver the same total power. The solid state approach appears feasible with a slightly greater specific mass and slightly higher cost than the klystron SPS design. L.F.M.

SOLAR POWER SATELLITE SYSTEM DEFINITION STUDY. VOLUME 5: SPACE TRANSPORTATION ANALYSIS, PHASE 3 Final Report, Dec. 1979 - May 1980
Jun. 1980 153 p refs 5 Vol.
(Contract NAS9-15636)
(NASA-CR-160746; D180-25969-5-Vol-5) Avail: NTIS HC A08/MF A01 CSCL 10A

A small Heavy Lift Launch Vehicle (HLLV) for the Solar Power Satellites (SPS) System was analyzed. It is recommended that the small HLLV with a payload of 120 metric tons be adopted as the SPS launch vehicle. The reference HLLV, a shuttle-derived option with a payload of 400 metric tons, should serve as a backup and be examined further after initial flight experience. The electric orbit transfer vehicle should be retained as the reference orbit-to-orbit cargo system. L.F.M.

EVALUATION OF THE VERTICAL AXIS WIND TURBINE AT DREO
Howard R. Braun, David J. Bristow, and Sylvia J. Wake Jan. 1980 100 p refs
(AD-A083961; DREO-R-822) Avail: NTIS HC A05/MF A01 CSCL 10/2

A Vertical Axis Wind Turbine-Battery Storage System was installed at the Defence Research Establishment Ottawa (DREO) in December 1975 and was operated for three years. The system was instrumented to control and monitor its operation and performance. This report deals with an evaluation study of a Vertical Axis Wind Turbine-Battery Storage System for a low-power unattended power source. The System's wind turbine, energy-generating and battery-storage system, mechanical drive system, installation, control-circuitry and data-acquisition system are described. Also, a performance-history outlining the problem areas encountered and a data-summary of two years of performance-data acquired during this study are presented. The objective of this study was to assess the System's ability to provide sixty watts of continuous power. The frequency of mechanical falures, especially in the turbine electrical drive system, made this particular system unsuitable as an unattended power source. It was also concluded that the average annual wind speed in the test location was of insufficient magnitude to provide the specified power output. GRA

INVESTIGATION OF CADMIUM SELENIDE PHOTOELECTROCHEMICAL CELLS
Robert A. Sawchuk and David R. Snelling Jan. 1980 69 p refs
(AD-A083690; DREO-TN-80-4) Avail: NTIS HC A04/MF A01 CSCL 10/3

Three photoelectrochemical devices, developed at Simon Fraser University, employing electrochemically deposited cadmium selenide photoanodes, a polysulphide redox electrolyte and an in situ energy storage compartment were evaluated at DREO. The photoelectrochemical devices were initially tested using tungsten filament lamps, and the evaluation was completed with a xenon lamp which closely matched a solar spectrum corresponding to AM1 (air mass 1) conditions having an irradiance level of 2/889 Wm. Maximum power output of the devices was in the 10-20 mW range resulting in a solar (AM1) to electrical conversion efficiency of less than 1%. A fill-factor approaching 0.25 was typical for the photoelectrochemical cells examined. Counter electrode polarization and electrolyte light absorption were identified and evaluated as efficiency limiting factors. Proposed loss mechanisms are: series resistance in the semiconductor bulk, electron tunneling to surface states, current carrier losses at electron-hole recombination centers, and shorting to the nickel substrate. The concept of in situ energy storage was not successfully demonstrated. It is concluded that counter electrode polarization can be overcome and that further research is required in order to detect the presence of surface states and electron-hole recombination centers as well as research oriented to characterize the structure of the depletion layer and the CdSe/electrolyte interface. The efficiency of the electrochemically deposited CdSe should approach the 5-10% efficiency observed for single crystal and pressure sintered CdSe. GRA

HYDROGEN TECHNOLOGY: FOREIGN, CHANGE 1 Report for period ending Feb. 1980
James D. Busi and Phillip Greenbaum 14 Apr. 1980 66 p
(AD-A083665; DIA-DST-1860S-522-78-CHG-1) Avail: NTIS HC A04/MF A01 CSCL 10/2

Hydrogen is both a promising medium for the efficient storage and transmission of energy and a potential alternate fuel. Hydrogen is not a primary energy source, however, since its production is dependent upon other energy sources (thermal, electrical, and radiant). To be practicable as a fuel, hydrogen must be produced in bulk quantities with a standardized purity that will satisfy consumer specifications. In addition, improved distribution systems must make hydrogen widely available to military, industrial, and domestic consumers if the successful evolution of a hydrogen economy is to occur. The greatest potential military impact of hydrogen lies in its use as an aviation fuel. Because of its high specific energy (124 kJ/kg--2.7 times greater than conventional aviation fuels), hydrogen has potential use as a fuel for subsonic transports, supersonic aircraft, and helicopters; however, safety measures, logistics, and storage and handling systems must be developed and standardized before this capability can be achieved. Initial experimental use of hydrogen in military aircraft may occur in the 1980s. A followup conversion and modification of aircraft and airports to hydrogen will require an additional 10 to 15 years. Secondary military interests include the use of hydrogen fuel cells for portable and transportable power generation, and its use as a propellant in aerospace applications. GRA

WIND CHARACTERISTICS FOR DESIGN OF WIND TURBINES: RESEARCH IN THE USA
J. R. Connell 1 Dec. 1979 22 p Presented at the IEA Meeting, Stockholm, 12-13 Sep. 1979
(Contract EY-76-C-06-1830)
(PNL-SA-7967; CONF-7909128-1) Avail: NTIS HC A02/MF A01

The Pacific Northwest Laboratory (PNL) of the United States Department of Energy has the primary responsibility for providing information on wind characteristics for design and for evaluation of performance of wind energy conversion systems (WECS). The objectives of the whole program are, broadly, to develop technical wind information which is relevant to the design of WECS, to determine suitable methods of measuring and analyzing the wind for evaluating WECS performance, and to communicate the information usefully to WECS designers. INVESTIGATION OF HEAT STORAGES WITH SALT HYDRATE AS STORAGE MEDIUM BASED ON THE EXTRA WATER PRINCIPLE
S. Furbo 1980 83 p refs
(EUR-6646-Pt-2) Avail: NTIS (US Sales Only) HC A05/MF A01; DOE Depository Libraries

Experimental and computational studies of a full scale heat storage with salt hydrate as storage medium and based on the extra water principle are reported. Two different types of full scale heat storage, both making use of an incongruently melting salt hydrate as storage medium and based on the extra water principle, were examined by means of long term experiments. No decrease in the performance of the storages during the long term experiments was observed, and experiences for both storage types are obtained. By means of computer calculations, heat of fusion storage with oil as the heat transfer fluid in direct contact with the storage medium were compared with hot water storage as part of solar heating systems with the Danish Reference Year as a basis. With results of these calculations, examples of economical comparisons between heat of fusion storage and hot water storages are carried out. DOE

COMMUNITY IMPEDIMENTS TO IMPLEMENTATION OF SOLAR ENERGY
M. D. Armstrong and J. E. Armstrong Nov. 1979 112 p refs
(Contract W-7405-eng-48)
(DOE/EV-0059) Avail: NTIS HC A06/MF A01

The complete array of institutional problems expected to emerge when solar technology is implemented on a national scale is assembled. The findings of the study are presented in two formats. First, the results are organized by the time frames of delays in solar implementation caused by the inherent difficulties a national energy policy would encounter in changing the way a given institution responds to specific solar technologies. Delay categories of 10 years or more, 6 to 8 years, and 3 to 5 years were selected; all were assigned under the assumption that a strong national policy promoting adoption of solar technologies would be in effect. The second format constitutes a description of the difficulties at the community level, associated with implementing each solar technology. DOE

HETEROJUNCTION SOLAR CELLS
S. Wagner 1978 17 p refs Presented at Royal Soc. Discussion Meeting on Solar Energy, London, 15 Nov. 1978
(Contract EG-77-C-01-4042)
(SERI/TP-32-134; CONF-7811142-1) Avail: NTIS HC A02/MF A01

A qualitative description of semiconductor/semiconductor heterojunction solar cells is given. The two groups of heterojunctions of greatest economic potential, very highly efficient cells for concentrator applications and moderately efficient thin film cells for flat plates, are described with examples. These examples illustrate the role of heterojunctions in surface passivation, monolithic multijunction devices, devices with semiconductors of only one conductivity type, and low-temperature fabrication techniques. UNDEVELOPED HYDROPOWER AS A POTENTIAL ENERGY SOURCE IN IDAHO
C. C. Warnick and L. F. Heitz Nov. 1979 28 p refs
(PB80-157399; W80-03918; OWRT-A-057-IDA(2)) Avail: NTIS HC A03/MF A01 CSCL 10B

The potential energy available in both regulated and unregulated streams in Idaho and the Pacific Northwest through the use of small scale hydro development was surveyed. For the survey a technique was developed to find low duration information along reaches of streams that do not have flow records due to inadequate gaging. Also a method for estimating flow duration curves for regulated streams was developed and applied. To determine head for power computations the difference in elevation at the inflow and outflow points of a reach was used. A preliminary social, political, and environmental feasibility evaluation was also made for each reach with theoretical energy potential. Summaries of the survey results are included. GRA

THE COMPOSITION, SOURCES AND SINK OF SOUTH POLAR AEROSOLS Ph.D. Thesis
William Charles Cunningham 1979 459 p
Avail: Univ. Microfilms Order No. 8016345

In order to develop a better understanding of global aerosol transport processes background aerosols collected at the South Pole were studied. The composition of South Polar aerosols was approximately the same over a period of seven years, but there were strong seasonal variations in aerosol source strengths. Sources that are significant contributors to the South Polar aerosols include the stratospheric sulfate layer, the seas, the Earth's crust, meteorites and, possibly, volcanoes. Comparisons of the seasonal variations in source component concentrations with one another and with radioisotopic tracers of stratospheric origin indicated specific transport mechanisms. Crustal material and sea salt are transported to the South Pole via the troposphere. Sulfate and meteoritic debris enter the troposphere at some distance from the South Pole and mix with tropospheric air during transport. Ice-crystal formation was found to effectively remove crustal and marine aerosols. Dissert. Abstr.

N80-27831 California Univ., Los Angeles.
A NUMERICAL INVESTIGATION OF THE EFFICIENCY WITH WHICH AEROSOL PARTICLES COLLIDE WITH CLOUD AND SMALL RAIN DROPS Ph.D. Thesis
Solomon Norman Grover 1980 299 p
Avail: Univ. Microfilms Order No. 8015981

A numerical investigation of the scavenging of aerosol particles by cloud and rain drops is presented. A numerical model which calculates collision efficiencies for drops colliding with particles was developed and applied to a wide variety of cases naturally occurring in the atmosphere. The model deduces the collision efficiency by integrating particle trajectories relative to the collector drop using a stable fourth order predictor-corrector scheme. Effects included are those due to the particle's inertia, the air flow pattern around the falling collector drop, electric forces which exist when external electric fields or charges on the drop and particle are present, and thermo-diffusiophoretic forces which arise when the relative humidity is below 100%. Dissert. Abstr.

COORDINATED AIRCRAFT AND SHIP SURVEYS FOR DETERMINING IMPACT OF RIVER INPUTS ON GREAT LAKES WATERS. REMOTE SENSING RESULTS
Charles A. Raquet, Jack A. Salzman, Thom A. Coney, Roger A. Svehla, Donald F. Shook, and Richard T. Gedney Jul. 1980 105 p refs
(NASA-TP-1694; E-172) Avail: NTIS HC A06/MF A01 CSCL 13B

The remote sensing results of aircraft and ship surveys for determining the impact of river effluents on Great Lakes waters are presented. Aircraft multi-spectral scanner data were acquired throughout the spring and early summer of 1976 at five locations: the West Basin of Lake Erie, Genesee River - Lake Ontario, Menomonee River - Lake Michigan, Grand River - Lake Michigan, and Nemadji River - Lake Superior. Multispectral scanner data and ship surface sample data are correlated resulting in 40 contour plots showing large-scale distributions of parameters such as total suspended solids, turbidity, Secchi depth, nutrients, salts, and dissolved oxygen. The imagery and data analysis are used to determine the transport and dispersion of materials from the river discharges, especially during spring runoff events, and to evaluate the relative effects of river input, resuspension, and shore erosion. Twenty-five LANDSAT satellite images of the study sites are also included in the analysis. Examples of the use of remote sensing data in quantitativley estimating total particulate loading in determining water types, in assessing transport across international boundaries, and in supporting numerical current modeling are included. The importance of coordination of aircraft and ship lake surveys is discussed, including the use of telefacsimile for the transmission of imagery. J.M.S.

A social psychological questionnaire was developed to study the effects of environmental noise and was applied to 636 people living in 19 different areas of Hamburg. The theoretical foundations and the statistical means employed in its development are described. Four main reactions to noise are isolated statistically, and it is determined that these are moderated by several intervening variables, chief of which are coping capacity for noise, the perceived dangerousness of the noise source, other daily loads, and the individual's lability. Studies conducted in and around John F. Kennedy Space Center, Merrit Island, Florida were designed to establish baseline conditions for various attributes of the biotic and abiotic environment. Features were described and quantitatively measured. Certain condition were found to be appropriate for the detection and assessment of possible environmental perturbations caused by future NASA activities. These include plant communities, mammal populations, rainfall chemistry, fish populations, and the status of rare and endangered species. On the basis of statistical analysis of quantitative data and logistic considerations, it was possible to refine the kinds and amounts of measurements needed to evaluate perturbations in selected environmental components. (AD-A083701; AMRL-TR-73-110-Vol-7) Avail: NTIS
HC A13/MF A01 CSCL 01/2

This report presents the results of field measurements of the far-field noise produced on the ground by military aircraft operating inside Grade-2 demountable suppressors during ground runup operations. For these ground runups, data are presented as a function of angle and distance to the aircraft. All of the data are normalized to standard acoustic reference conditions of 59 F temperature and 70% relative humidity. Volume 1 discusses the scope, limitations, and definitions needed to understand and use the volumes containing the noise data. Noise data are presented in this Volume 7 for the following aircraft suppressor systems: A-7 in the AF32A-19 and AF-32A-24 noise suppressors, KC-135A in the modified AF32A-52 noise suppressor, F-4 in the AF32A-14 noise suppressor, F-5 in the AF32A-18 noise suppressor, F-15 in the AF32A-23 noise suppressor, F-16 in the AF32A noise suppressor, F-100 in the AF32A-16 noise suppressor, F-106 in the AF32A-17 noise suppressor, F-111 in the AF32A-13 noise suppressor and T-38 in the AF32A-18 noise suppressor. HC A04/MF A01 CSCL 01/2

This report examines the role of economic disincentive as an inducement to noise abatement. The particular disincentive analyzed is a system of noise emission charges (NEC) which is imposed at airports on commercial aircraft operations which are above maximum noise emission allowances. The methodology developed is in the form of a mathematical programming (MP) model which seeks to minimize the total cost of a disincentive-based policy. Preliminary analyses conducted with the model indicate (qualitatively) that the method of noise emission charges, administered at the airport level on operations exceeding the current noise emission standards, is an economically feasible method for inducing noise abatement. The single most critical assumption underlying this conclusion is that if the NEC administration is voluntary, then a sufficient number of airports must impose the charges. The modeling concept presented is suitable for the analysis of a broad spectrum of aviation economic policy related issues. GRA

FEDERAL AVIATION ADMINISTRATION HIGH ALTITUDE POLLUTION PROGRAM, SECOND BIENNIAL REPORT, PREPARED IN ACCORDANCE WITH THE OZONE PROTECTION PROVISION, SECTION 153G, OF THE CLEAN AIR ACT AMENDMENTS OF 1977. Biennial Report, Jan. 1978 - Dec. 1979
N. Sundararaman, W. Smith, and J. Rogers. Dec. 1979. 64 p. refs.
(AD-A081520; FAA-EE-79-24) Avail: NTIS
HC A04/MF A01 CSCL 13/2

This report was prepared in accordance with the Stratospheric Ozone Protection provisions of Public Law 95-95, the Clean Air Act Amendments of 1977. The impact of high altitude aviation on stratospheric ozone is now believed to be an increase in total columnar ozone for flights up to 20 km (about 66,000 feet). This result has been brought about through improvements in one-dimensional chemical kinetics-transport model of the stratosphere. They show that aircraft-injected pollutants (primarily nitrogen oxides) generate ozone through simplified 'amog' mechanisms in the upper troposhere and lower stratosphere while depleting it through the classic catalytic destruction mechanism at higher altitudes. The net result at present is a slight overall ozone increase. The uncertainty in the present model calculations, however, is unknown. The effort of the High Altitude Pollution Program of the Federal Aviation Administration is aimed at

identifying and resolving the uncertainties so that a 'consensus' method or methods can be obtained for future assessments of the impacts of high altitude aviation on the environment. GRA

FAA INTEGRATED NOISE MODEL VALIDATION. PHASE 1: ANALYSIS OF INTEGRATED NOISE MODEL CALCULATIONS FOR AIR CARRIER FLYOVERS
R. G. Gados and J. M. Aldred. Dec. 1979. 103 p. refs.
(Contract DOT-FA80WA-4370)
(AD-A081426; MTR-79W; FAA/EE-80-04) Avail: NTIS
HC A06/MF A01 CSCL 01/3

The Federal Aviation Administration's Integrated Noise Model is a set of computer programs which is used to predict the noise impact of aircraft in the vicinity of an airport. Through use of extensive statistical analyses, this study investigates the accuracy and suitability of the noise model in calculating aircraft noise exposure by: examining the agreement between the noise model in calculating single noise events and the actual measurement of those events, assessing the sensitivity and controllability of the noise model to aircraft thrust assumptions, and investigating noise curves used in calculating noise exposure by testing variables for significance in estimating noise and by comparing the shape of empirical noise curves with those already in the noise model. Data for the analysis were obtained from field observations of noise from air carrier flight operations over various noise monitoring sites near Washington National and Dulles International Airports. LAND USE AND ENVIRONMENTAL IMPACTS OF DECENTRALIZED SOLAR ENERGY USE
Robert H. Twiss, Patricia L. Smith, Allen E. Gatzke, and Scott T. McCreary. Jan. 1980. 206 p. refs.
(Contract W-7405-eng-48)
(DOE/EV-0067) Avail: NTIS HC A10/MF A01

The physical, spatial and land-use impacts of decentralized solar technologies applied at the community level by the year 2000 are examined. The results are intended to provide a basis for evaluating the way in which a shift toward reliance on decentralized energy technologies may eventually alter community form. Six land-use types representative of those found in most US cities are analyzed according to solar penetration levels identified in the maximum solar scenario for the year 2000. The scenario is translated into shares of end use demand in the residential, commercial and industrial sectors. These proportions become the scenario goals to be met by the use of decentralized solar energy systems. The percentage of total energy demand is assumed to be 36.5 percent, 18.8 percent and 22.6 percent in the residential, commercial and industrial sectors respectively. The community level scenario stipulated that a certain percentage of the total demand be met by on-site solar collection, i.e. photovoltaic and thermal collectors, and by passive design. This on-site solar goal is 31.9 percent (residential), 16.8 percent (commercial) and 13.1 percent (industrial). DOE

DRAFT RECOMMENDED PRACTICE FOR MEASUREMENT OF GASEOUS AND PARTICULATE EMISSIONS FROM HEAVY-DUTY DIESEL ENGINES UNDER TRANSIENT CONDITIONS
Eugene Danielson. Apr. 1979. 86 p.
(PB80-153943; EPA-AA-SDSB-79-18) Avail: NTIS
HC A05/MF A01 CSCL 13B

The equipment required and the procedures to be followed in measuring exhaust emissions from heavy-duty diesel engines are described. For clarity and continuity, this document is structured to be totally compatible with the proposed heavy-duty gaseous emission regulations. It should be noted that: (1) this procedure does not negate or adversely affect the proposed heavy-duty regulations, but merely specifies the additional equipment and steps necessary for diesel particulate testing; and (2) this format incorporates diesel particulate testing for the 1983 and later model years. Sections in the proposed heavy-duty gaseous emission regulations which are affected by the incorporation of particulate testing are included. GRA

HC A03/MF A01 CSCL 13B

Polymeric ion-exchange resins specific for metal ions and for systems for removing iron from water were designed. The resins are vinyl polymers bearing hydroxamic acids and have strong affinity for iron. Polymers were prepared in which the spacing of the hydroxamic acids were varied. The stability constants of the iron complexes showed that the spacing of the hydroxamic acids was important both in complex stability and in the selectivity of the resin for iron. Polymers for binding copper and mercury were synthesized and evaluated. The functional group for copper was the tripeptide glycylglycylhistidine. For mercury, polymers containing sulfide were studied. Preliminary evaluation showed that the polymers formed complexes with copper and mercury. Various applications of these resins in environment, health, and industry are suggested. GRA

HC A03/MF A01 CSCL 13B

Wastewater from an airplane parts manufacturing plant was sampled using the U.S. EPA screening protocol for the 129 priority pollutants. The results of the study show that the treatment practiced at this site removes more than 90 percent of the chromium and zinc and 70 percent of the copper. The system is slightly less effective for cadmium because of its low concentration in the influent to the treatment plant. Nevertheless, in excess of 60 percent of the cadmium is removed. Because of the extremely low concentrations of other metals in the influent to the treatment plant, the effectiveness of the treatment for

their removal could not be evaluated with any degree of confidence. GRA

(Grants NSF GI-38986; NSF AEN-73-10596; NSF ENV-73-10596; NSF ENV-77-10198; SRI Proj. 2687; SRI Proj. 6892)
(PB80-164791; NSF/RA-800014) Avail: NTIS
HC A05/MF A01 CSCL 14B

The development and demonstration of laser techniques for performing remote measurements of air pollutants are described. The investigation focused on the differential absorption laser radar or DIAL technique to detect trace constituents of the atmosphere. DIAL system measurements of NO2, SO2, O3, HCl, CH4, N2O, H2O, and CH2 – CH2 in various spatial regions demonstrate the feasibility of obtaining remote measurements at high sensitivity and long range using currently available technology. Applications of this research encompass measurement of the environment, exploration of new energy resources, and military uses. Specific applications of the DIAL systems include enforcement of air pollution regulations, testing air pollution models, and explorations of regions of geothermal activity. DIAL systems are being investigated for petroleum exploration. GRA

FINITE ELEMENT MODELLING OF TORSIONAL EIGENVIBRATIONS OF THE EARTH. Ph.D. Thesis
James Fairman Stifler. 1979. 96 p.
Avail: Univ. Microfilms Order No. 8014896

A numerical algorithm of how the Earth vibrates was developed. Finite elements allow a realistic three dimensional Earth to be modelled having both radial and lateral variations in seismic properties. Numerical algorithms are produced that yield efficient estimations of the nondegenerate eigenfunctions and eigenfrequencies of this laterally inhomogeneous spheroid. These serve as quite independent alternatives to previous mathematical methods to study this problem. The algorithms rely upon Rayleigh's Variational Principle to solve the finite element eigenproblem. The Earth model used is perfectly elastic and nonrotating. The deviations in eigenfrequencies due to the structural contrasts between the continents and the oceans are found to increase with increasing order of oscillation. The variations of the amplitudes of the eigenfunctions of these oscillations are seen to have a significant global variation. The lower order models show a latitudinal dependence of the amplitudes that would be expected were the Earth a simple ellipsoid. The higher order modes have more longitudinal amplitude dependence as a result of the increased perturbation effects of the continents. Dissert. Abstr.

MAGMA MIGRATION. Ph.D. Thesis
Judson Lewis Ahern. 1979. 104 p.
Avail: Univ. Microfilms Order No. 8015628

The principles of magma migration by porous flow and convective upwelling are applied to the modeling of the thermal evolution of the moon. Radioactive heat-producing elements are concentrated in the first partial melts formed early in the moon's history. Subsequently, magma migration causes removal of heat-producing elements to the surface. Finite difference thermal modeling of the moon shows this effect to be important. Moon models which are initially hot may have a lower present-day heat flux than colder models. Two distinct melting episodes can arise due to radioactive element distribution. The first of these is responsible for the feldspathic lunar crust; the second melting episode, between 4 and 3 billion years ago, produced the mare basalts. Dissert. Abstr.

THE PALEOMAGNETISM OF THE CARBONIFEROUS STRATA IN THE NORTHERN APPALACHIAN BASIN WITH APPLICATIONS TOWARD MAGNETOSTRATIGRAPHY. Ph.D. Thesis
Stephen John Shulik. 1979. 305 p.
Avail: Univ. Microfilms Order No. 8015327

Rocks from the upper Devonian redbeds through the Pennsylvanian to the contact between the Pennsylvanian Allegheny and Conemaugh Groups from southwestern Pennsylvania and the proposed Pennsylvanian Stratotype in West

Virginia were sampled. The samples were sequentially demagnetized and measured using a superconducting rock magnetometer (ScT). The resulting data produced Virtual Geomagnetic Poles for these rocks. Several different pole groupings were noted: reverse and normal Carboniferous, present day, normal Cretaceous, and equatorial poles which can be interpreted as various combinations of the other four poles. Normal Carboniferous poles are recorded in the lower portion of the Wymp's Gap Limestone (Chesterian) and in the shales between the Lower and Middle Kittanning Coals (Desmoinesian). Dissert. Abstr.

THE CONTRIBUTION OF OZONE ALOFT TO SURFACE OZONE MAXIMA Ph.D. Thesis
Roy Bruce Evans 1979 310 p
Avail: Univ. Microfilms Order No. 8013939

Three principal sources contribute to urban ozone concentrations: (1) background of baseline concentrations advected into the upwind side of the city; (2) entrainment of left-over ozone trapped above the noctural radiation inversion; and (3) the photochemical production of ozone from the reaction of local emissions (hydrocarbons and NOx and advected ozone and precursors. Contributions of these three sources to urban ozone concentrations were estimated by analysis of data collected on seven case days in St. Louis in 1976 as part of the Regional Air Pollution Study (RAPS). For the seven days examined the baseline concentrations being advected into the St. Louis area contributed fractions of the observed maximum O3 concentration ranging from 39% to 60%. Examination of the ambient monitoring data obtained with instrumented helicopters and from a surface monitoring network indicates that the O3 entering St. Louis on the upwind side was mixed downward from aloft and had been transported into the St. Louis area by nighttime winds above the nocturnal radiation inversion. Simulation of three of the seven case days with a physically simple photochemical box model indicates that the mechanism of entrainment is responsible for a relatively minor portion of the maximum city center O3 concentration (between 5 and 9%); advection of the ozone by winds after the breakup of the inversion is an important mechanism, however, contributing more than half of the ozone concentrations observed in the city center for the days modeled. Dissert. Abstr.

CAMBRIAN STRATIGRAPHY OF THE LIBBY TROUGH, MONTANA Ph.D. Thesis
Rolf Konrad Aadland 1979 323 p
Avail: Univ. Microfilms Order No. 8012065

Three exposures of Cambrian rocks occur as erosional remnants in the Libby Trough, Montana. The trough is a northwest-southeast striking faulted syncline, located between Thompson Falls and Libby, Montana. Three measured sections were obtained in the southernmost exposure, and one measured section each in the northern exposures. Nine hundred five samples were collected, stabbed, polished and described using a binocular microscope. Ninety representative thin sections were examined to verify the primary rock descriptions. Cambrian rocks throughout western Montana include a basal sandstone overlaid by a succession of two shale and two carbonate units in alternating sequence. Although the measured sections are incomplete, the carbonates can be subdivided into five lithologic units. Quartz arenites of the Flathead Formation (approximately 8 m thick) form the basal unit of the transgressive sequence. Shales with interbeds of shaley sandstones and shaley lime mudstones characterize the Wolsey Shale (approximately 75 m thick). The overlying carbonate sequence (Fishtrap dolomite) is about 915 m thick and is divided into five lithofacies. Dissert. Abstr.

SPECTRAL ANALYSIS OF GEOS-3 ALTIMETER DATA AND FREQUENCY DOMAIN COLLOCATION Ph.D. Thesis
Kamil Eren 1980 157 p
Avail: Univ. Microfilms Order No. 8015872

The mathematical background in spectral analysis as applied to geodetic applications is summarized. In geodetic problems, there are usually discrete and nonperiodic data. The resolution of the GEOS-3 altimeter data was examined by determining the shortest wavelength recoverable. The data from some 18 profiles were used. The total power in the sea surface topography with respect to the reference ellipsoid as well as with respect to the GEM-9 surface was computed. A fast inversion algorithm for matrices of simple and block Toeplitz matrices and its application to least squares collocation is explained. This algorithm yields a considerable gain in computer time and storage in comparison with conventional least squares collocation. Frequency domain least squares collocation techniques are introduced and applied to estimating gravity anomalies from GEOS-3 altimeter data. These techniques also reduce the computer time and requirements in storage associated with the conventional least squares collocation. Dissert. Abstr.

N80-27860 California Univ., Berkeley.
COMPUTER-ORIENTED METHODS FOR ASSESSING RELIABILITY OF COMPLEX SYSTEMS Ph.D. Thesis
Randall Ramon Willie 1979 148 p
Avail: Univ. Microfilms Order No. 8014933

An important task in reliability analysis of a complex system is identification of the logical dependence of system performance on performance of components. An explicit description of this logical dependence, usually in terms of reliability minimal cut and patch set families was studied. These families are useful not only for evaluating reliability characteristics of a system but also as a design tool to guide system modification for enhancing reliability. The first problem to be considered is that of the determining families of critical failure modes when the logical relationship between system failure and failure of its subsystems and components can be modelled effectively as a Boolean logic tree, commonly called fault tree. Some new computer-oriented methods for deriving these failure modes from a system fault tree. The methods are based on a rapid procedure for decomposition of the fault tree and various subtrees. The structure of some complex systems may not be suitable for decomposition of the fault tree and various subtrees. The structure of some complex systems may not be suitable for development of a fault tree. Dissert. Abstr.

LOW-ENERGY PLASMA IN THE DAYSIDE AURORAL ZONE Ph.D. Thesis
Roy Banks Torbert 1979 68 p
Avail: Univ. Microfilms Order No. 8014908

Measurements of ions and electron in the energy range of 10 eV to 10 keV/Q are presented from the flights of two sounding rockets launched from Sondre Stromford, Greenland, into the dayside auroral zone at 09.00 MLT. Observations of energy versus time dispersion of precipitating ions indicate that H+ and He(++) were injected into the magnetosphere some 7 to 19 R sub E from the rocket probe. The spectra of these ions are consistent with solar wind origin. From the correlation of deviations from the expected ion dispersion curve and the onset of auroral electron precipitation, a region of parallel electric field is determined to exist within a few earth radio of the probe. Measurements of electron angular distributions support this conclusion. Implications of these measurements to the structure and dynamics of an open magnetosphere are presented in a qualitative model. Dissert. Abstr.

N80-27862 California Univ., Los Angeles.
COMPUTER SIMULATION OF A MAGNETOSPHERIC SUBSTORM Ph.D. Thesis
Moshe Harel 1980 143 p
Avail: Univ. Microfilms Order No. 8015982

Results of the first comprehensive computer simulation of the behavior of the earth's inner magnetosphere during a substorm-type event are reported. The model was tested for a substorm-type event that occurred on September 19, 1976. Satellite data (primarily from the Air Force S3-2 satellite) were used extensively both for boundary conditions and for comparisons with model predictions. Other data were also used as input for our time-dependent magnetic field and conductivity models. The S3-2 data for the event show some novel features, independent of the simulation. Dawn-dusk electric fields show a general correlation with the east-west magnetic field perturbations. Unexpectedly, two of the passes display substantial regions of sunward plasma flow poleward of the main part of the region-1 Birkeland currents. The cross-polar-cap potential drops

computed from the data represent the first effort at satellite monitoring of this important parameter during various phases of a substorm, and show an important enhancement during the substorm. Dissert. Abstr.

THE KINETIC ENERGY CLIMATOLOGY OF TROPOSPHERIC AND LOWER STRATOSPHERIC FLOW REGIMES ASSOCIATED WITH 500 MB INTERMEDIATE AND SHORT WAVES OVER NORTH AMERICA Ph.D. Thesis
Yi-Tsuei Sheu 1979 113 p
Avail: Univ. Microfilms Order No. 8015517

A diagnostic analysis of total, vertical mean and vertical shear kinetic energy budgets for mid latitude 500 mb synoptic scale waves in the winter-spring season is presented. The data used were standard twice daily rawinsonde observations in 50 mb increments from surface to 100 mb over Southern Canada and the United States for December 1967, 1969 and March, April, 1970. Several conclusions can be drawn from the results of this study. (1) The generation and dissipation of kinetic energy balance each other in the boundary layer. (2) Although not balanced, a significant negative correspondence between the generation and the horizontal transport exists in the free atmosphere. Positive generation and horizontal flux divergence are observed in moist waves. (3) Both barotropic and baroclinic processes provide a source of kinetic energy to wave systems. Most of the baroclinic source is contributed in the boundary layer, although baroclinic processes extract energy from the waves in the free atmosphere. (4) Kinetic energy dissipation occurs primarily in the barotropic component of the flow. Baroclinic flow supplies energy from subgrid scale motions to the waves. (5) The energy is converted from the vertical shear to mean regimes. This vertical shear to mean kinetic energy conversion reveals that the atmosphere tends toward a more barotropic state at the expense of the baroclinic energy. Dissert. Abstr.

N80-27864 Cornell Univ., Ithaca, N. Y.
NUMERICAL SIMULATION AND THEORY OF STRONG IONOSPHERIC GRADIENT-DRIFT TURBULENCE Ph.D. Thesis
Michael John Keskinen 1978 286 p
Avail: Univ. Microfilms Order No. 8015763

Numerical and analytical studies are made of the nonlinear development of the gradient-drift or E x B instability using the mathematical model that describes the Type 2 irregularities in the E region equatorial electrojet. Using a two dimensional electrostatic fluid code with parameters typical of the daytime electrojet, the temporal and spatial power spectra are computed over a much larger range of wavelengths (9 to 128 m) than is presently studied with radar. The mean frequencies obtained agree well with linear theory except at short wavelengths while the linewidths are greater by up to an order of magnitude than the linear damping rates. For the linearly damped modes at a particular wavelength the linewidths increase with increasing electron drift velocity contrary to linear theory while at a fixed drift velocity the linewidths increase with decreasing wavelength. For three drift velocities the time averaged spatial power spectra are found to be essentially isotropic. Analytically, the direct interaction approximation of Kraichnan as modified by Kadomtsev is employed to develop a strong turbulence theory which predicts both a nonlinear wave damping, a power law for the two dimensional spectrum. Dissert. Abstr.

N80-27865 Pittsburgh Univ., Pa.
ROCKET BORNE COMPOSITION MEASUREMENTS OF THE LOWER THERMOSPHERE WITH A NEW TYPE OF INSTRUMENTATION: AURORAL SECONDARY ELECTRON ENERGY SPECTRA MEASURED WITH A NEW FORM OF CYLINDRICAL ANALYZER Ph.D. Thesis
Peter Wayne Erdman 1979 136 p
Avail: Univ. Microfilms Order No. 8015299

In an effort to improve measurements in several problem areas of atmospheric physics, two new instruments were developed for use onboard sounding rockets. Each provides significantly improved capabilities over devices previously available to researchers, and they make possible measurements which would otherwise be impractical or less precise. Both of these instruments have a multitude of laboratory as well as geophysical applications and are potentially of interest to workers in other fields. The first, which has been named the 'Optical Compsotion Spectrometer' (OCS), takes advantage of the characteristic emission spectra of an atom or molecule produced by electron impact in order to measure the absolute number density of that species. The second instrument is a new form of cylindrical, charged particle energy analyzer. This device features high energy dispersion, differential output, simple mechanical and electrical design, and high 'etendue'. Dissert. Abstr.

THE INFLUENCE OF NO AND ClO VARIATIONS AT TWILIGHT ON THE INTERPRETATION OF SOLAR OCCULTATION MEASUREMENTS
Robert Boughner, Jack C. Larsen (Systems and Appl. Sci. Corp., Hampton, Va.), and Murali Natarajan *In its* High Resolution Infrared Spectry. Tech. for Upper Atmospheric Meas. May 1980 p 39-53 refs (For primary document see N80-27866 18-46)
Avail: NTIS HC A06/MF A01 CSCL 04A

The influence of short lived photochemically produced species on solar occultation measurements of ClO and NO was examined. Time varying altitude profiles of ClO and NO were calculated with a time dependent photochemical model to simulate the distribution of these species during a solar occultation measurement. These distributions were subsequently used to calculate simulated radiances for various tangent paths from which mixing ratios were inferred with a conventional technique that assumes spherical symmetry. These results show that neglecting the variation of ClO in the retrieval process produces less than a 10 percent error between the true and inverted profile for both sunrise and sunset above 18 km. For NO, errors are less than 10 percent for tangent altitudes above about 35 km for sunrise and sunset; at lower altitudes, the error increases, approaching 100 percent at altitudes near 25 km. the results also show that average inhomogeneity factors, which measure the concentration variation along the tangent path and which can be calculated from a photochemical model, can indicate which species require more careful data analysis. R.C.T.

APPLICATIONS OF SATELLITE DATA RELAY TO PROBLEMS OF FIELD SEISMOLOGY
W. J. Webster, Jr., W. H. Miller, R. Whitley, R. J. Allenby, and R. T. Dennison (Computer Sciences Technicolor Assoc., Seabrook, Md.) Apr. 1980 112 p refs Submitted for publication
(NASA-TM-80673) Avail: NTIS HC A06/MF A01 CSCL 08K

A seismic signal processor was developed and tested for use with the NOAA-GOES satellite data collection system. Performance tests on recorded, as well as real time, short period signals indicate that the event recognition technique used is nearly perfect in its rejection of cultural signals and that data can be acquired in many swarm situations with the use of solid state buffer memories. Detailed circuit diagrams are provided. The design of a complete field data collection platform is discussed and the employment of data collection platforms in seismic network is reviewed. Author

REDUCING THE ERROR OF GEOID UNDULATION COMPUTATIONS BY MODIFYING STOKES' FUNCTION
Christopher Jekeli May 1980 55 p refs
(Grant NGR-36-008-161)
(NASA-CR-163316; Rept-301) Avail: NTIS HC A04/MF A01 CSCL 08E

The truncation theory as it pertains to the calculation of geoid undulations based on Stokes' integral, but from limited gravity data, is reexamined. Specifically, the improved procedures of Molodenskii et al. are shown through numerical investigations to yield substantially smaller errors than the conventional method that is often applied in practice. In this improved method, as well as in a simpler alternative to the conventional approach, the Stokes' kernel is suitably modified in order to accelerate the rate of convergence of the error series. These modified methods, however, effect a reduction in the error only if a set of low-degree potential harmonic coefficients is utilized in the computation. Consider, for example, the situation in which gravity anomalies are given in a cap of radius 10 deg and the GEM 9 (20,20) potential field is used. Then, typically, the error in the computed undulation (aside from the spherical approximation and errors in the gravity anomaly data) according to the conventional truncation theory is 1.09 m; with Meissl's modification it reduces to 0.41 m, while Molodenskii's improved method gives 0.45 m. A further alteration of Molodenskii's method is developed and yields an RMS error of 0.33 m. These values reflect the effect of the truncation, as well as the errors in the GEM 9 harmonic coefficients. The considerable improvement, suggested by these results, of the modified methods over the conventional procedure is verified with actual gravity anomaly data in two oceanic regions, where the GEOS-3 altimeter geoid serves as the basis for comparison. The optimal method of truncation, investigated by Colombo, is extremely ill-conditioned. It is shown that with no corresponding regularization, this procedure is inapplicable. Author

ASSESSMENT OF ATMOSPHERIC HEIGHT UNCERTAINTIES FOR HIGH PRECISION SATELLITE ALTIMETER MISSIONS TO MONITOR OCEAN CURRENTS
Julius Goldhirsh and John R. Rowland Jun. 1980 73 p refs
(Contract NASA Order P-78192; Contract N00024-78-C-5384)
(NASA-CR-156868; JHU/APL-SIR80U-018) Avail: NTIS HC A04/MF A01 CSCL 04A

The influence of the atmosphere on nadir directed signal associated with satellite altimeters are examined. Frequencies at 6, 13.5, and 35 GHz are selected so as to provide a parameter study. Uncertainties are summarized in both existing and proposed techniques which establish ionospheric and tropospheric height corrections. The error summary thus gives values describing the best you can do in height resolution (as dictated by atmospheric parameters) for a satellite borne altimeter system. The results presented reflect data gleaned from the literature, at large, as well as from the existing body of published literature associated with the Seasat A Altimeter Experiment. Specifically considered are: (1) the effects of precipitation on altimeter signals, (2) range errors due to refractive index variations in both the clear atmosphere (convective and nonconvective) and clouds, and (3) range errors introduced by the ionosphere. A preliminary analysis is pursued establishing the feasibility of incorporating rain rate range gates in a future satellite-borne altimeter system. F.O.S.

EUROPEAN EARTHQUAKE PREDICTION PROGRAM
T. D. Guyenne, ed. and G. Lavy, ed. Mar. 1980 218 p refs
Partly in ENGLISH and FRENCH Proceedings of Council of Europe Parliamentary Assem. and ESA Workshop on European Earthquake Prediction Program, Strasbourg, 31 Jan. - 1 Feb. 1980 Prepared jointly with Council of Europe, Strasbourg, France
(ESA-SP-156) Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

The collection of geophysical data, the identifying of earthquake precursors, and the forecasting of earthquake events are considered. Various programs and projects covering seismogeneticity, seismotectonics, and the development of data collection systems are proposed, including cost estimates. Research emphasis is on the Iberian peninsula, the Italian peninsula, the area around Greece, and the North Anatolian fault zone. Methodology is explained, while a METEOSAT data collection system and a European data center are described. For individual titles, see N80-27875 through N80-27891.

A BRIEF SUMMARY OF A PROPOSED PROGRAM FOR EARTHQUAKE PREDICTION AND THE STUDY OF PLATE DYNAMICS IN SOUTHWEST EUROPE
A. Lopez-Arroyo *In* ESA European Earthquake Prediction Program Mar. 1980 p 19-21 (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

A program to develop and test, on a seismically active zone, observational techniques for earthquake prediction, to measure the relative displacement of the Euro-Asiatic, African, and American plates, and to investigate the influence of such plate dynamics on the seismic energy release in a given area is proposed. The earthquake prediction experiment will be carried out in a zone selected from one of the two most active regions of Spain, Andalucia and Murcia, where recent earthquakes (Granada 1884, Torrevieja 1826) resulted in considerable damage and hundreds of casualties. Data handling techniques and cost considerations are discussed. Author (ESA)

PROPOSED PROGRAM FOR EARTHQUAKE PREDICTION

IN SOUTHERN SPAIN
A. Lopez-Arroyo *In* ESA European Earthquake Prediction Program Mar. 1980 p 23-35 refs (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

Southern Spain, included for the most part in the Alpine chain, and located close to the contact zone of two large plates (Eurasia and Africa) is the site of a seismic activity responsible for some catastrophic earthquakes in the past. A program to develop and test in this zone different techniques of earthquake prediction is proposed. Many techniques already tried in other regions will be tested, such as the study of past and present day seismicity (variation in time and space of geometric and dynamic focal parameters), the application of geodetic methods (repeated triangulations, trilaterations, and levelling), geophysical measurements relative to the Earth magnetic and gravity fields, tilt and strain recording, etc. It is hoped that the best suited techniques for earthquake prediction in each zone can be derived from the test. Data handling techniques and cost considerations are also discussed. Author (ESA)

INVESTIGATION OF PRECURSORS AROUND THE AZORES ARCHIPELAGO AND THE SEISMOGENETIC CAPACITY OF THAT AREA: MODELS OF THE EARTHQUAKE PROCESS ALONG THE BOUNDARY BETWEEN THE AFRICAN AND EURASIAN PLATES, AFFECTING THE PORTUGUESE TERRITORY
L. A. MendesVictor *In* ESA European Earthquake Prediction Program Mar. 1980 p 37-53 (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

The behavior of the Earth's surface, mainly uplift and subsidence, were analyzed and models suggested that relate the changes in elevation to earthquakes are suggested. A program to monitor various earthquake precursors is proposed. Gravity measurements, strain measurements, tilt, magnetic field configuration, electrical resistivity, and seismic p and s wave velocities are all suggested for study. Data analysis for larger networks than the one proposed as well as comparison of results obtained for different regions are also brought up. For the moment the described project intends to study the time and space evolution of two seismic active structures and their seismogenetic capacity. Author (ESA)

CRUSTAL STRESS AND HEAT FLOW MEASUREMENT IN NORTHERN ANATOLIA
C. Froidevaux *In* ESA European Earthquake Prediction Program Mar. 1980 p 103-105 (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

Earthquake precursor phenomena along the North Anatolian fault zone is considered in order to determine the crustal stress field associated with this major seismic zone. Only two other major intracontinental active shear zones comparable with that of North Anatolia are presently under study, the San Andreas fault system in California and the Alpine fault in New Zealand. It is suggested that the mechanical behavior of these three transcurrent faults be tested and compared. To this end it is of primary importance to determine best flow profiles and make series of in situ stress measurements. Techniques include the use of bore holes (300 m deep) for heat flow measurements and stress measurements based on hydrofracturing. Project cost considerations are also taken into account. A FIRST EUROPEAN JOINT EFFORT IN EARTHQUAKE PREDICTION RESEARCH

M. Bonatz, R. Meissner (Kiel Univ.), and J. Zschau (Kiel Univ.) *In* ESA European Earthquake Prediction Program Mar. 1980 p 107-122 refs (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

An area along the trans-Anatolian fault zone in Turkey selected for an intensive study on earthquake precursor phenomena was based on historical and statistical data of earthquake occurence. As the nucleus of a European earthquake prediction program, including future measurements from space, three kinds of ground based experiments are proposed: (1) a geodetic experiment, i.e., high precision distance and angle measurements for the determination of pre-, co-, and post-seismic strain and creep phenomena; (2) a seismic experiment for measuring velocities and absorption in two perpendicular directions; and (3) a tiltmeter experiment, measuring surface tilt related to changes in elastic and inelastic parameters. The data handling system, including satellite data relay, and experiment cost are also considered.

EARTHQUAKE PREDICTION RESEARCH FOR THE NORTHERN ANATOLIAN FAULT ZONE (TURKEY)
A. Isikara (Istanbul Univ.), R. Ates, and A. Guerpinar *In* ESA European Earthquake Prediction Program Mar. 1980 p 123-131 (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

Various earthquake precursors observed in the Anatolian fault area are studied in order to contribute to earthquake prediction methodology. A precise knowledge of the rate of movement and strain accumulation on a time scale derived from tectonic theory is sought. Data are to be collected on microearthquakes, geodetics, tilt, seismic wave velocities, magnetic field changes, gravity field changes, and changes in ground water level. Public observations on anomalous events are also considered to be useful.

AN OUTLINE PROPOSAL OF SOME AIMS, STRATEGIES AND OBJECTIVES
B. K. Atkinson *In* ESA European Earthquake Prediction Program Mar. 1980 p 135-155 refs (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

Some general comments are made concerning the overall philosophy of earthquake hazard reduction. An outline is presented of the key areas that need studying in any European earthquake prediction program. Finally, a specific project for experimental studies of the physical mechanisms of earthquake sources is proposed. Phenomena to be studied include static fatigue leading to subcritical crack growth, dynamic fatigue in the development of fault rock, fracture healing processes, acoustic emission, and post failure events. The measurement of geophysical parameters is also proposed. Funding requirements are discussed.

RESEARCH ON SPECIFIC MODELS FOR THE OCCURRENCE OF SIGNIFICANT EARTHQUAKES IN EUROPE
H. Berckhemer (Inst. fuer Meteorol. u. Geophys., Frankfurt am Main, West Germany) and G. Purcaru *In* ESA European Earthquake Prediction Program Mar. 1980 p 161-176 refs (For primary document see N80-27874 18-46)
Avail: NTIS HC A10/MF A01; ESA, Paris FF 80

The existence of regularities in the occurrence of earthquake events is discussed relative to European earthquake case histories. Emphasis is on identifying a pattern as to location, magnitude, and time of occurrence data. The concepts of seismic cycle and seismic gap in prediction models are described. As an example, the Yugoslavian earthquake (April 15, 1979; seven on the Richter scale) is examined. Results show this event could have been predicted using the presented method. A project to implement the method is porposed.

An ultra-miniature conductivity probe for small rocket applications has been developed for measurements within the lower atmosphere (D-region and below). The probe is contained within a MET rocket and may be launched from standard MET sites with a minimum of personnel and equipment. The measuring instrument is a miniature Gerdien condenser, which is ejected near apogee and is trailed by a starute to reduce descent speeds below sonic values. Accumulated data are transmitted via telemetry to a recording ground station. The initial application of this instrument was at the White Sands Small Missile Range on 14 December 1978. After payload ejection near apogee data were recorded for over an hour as the instrument descended on the starute. Some modifications are indicated, but basically the concept and experiment appear sound.

A DISCUSSION OF ARCTIC IONOGRAMS Interim Report
R. A. Wagner and C. P. Pike 14 Apr. 1980 24 p refs Presented at AGARD Tech. Meeting, Lindau/Harz, West Germany, Sep. 1971
(AD-A083550; AFGL-TR-80-0120) Avail: NTIS HC A02/MF A01 CSCL 04/1

Example of arctic ionogram sequences, recorded on the AFCRL Flying Ionospheric Laboratory, are presented. The purpose of this paper is to show that: (a) ionogram sequences, recorded on arctic flights, facilitate the interpretation of oblique incidence echoes from E- and F-layer heights, (b) parameters of the arctic ionosphere can be mapped by using the 'auroral oval' as an ordering system, (c) vertical and oblique incidence echoes, appearing on ground station ionograms, can be interpreted in terms of the station's position relative to the auroral oval. The analysis of a three hour flight with 6 latitudinal scans underneath an auroral band shows the close relationship between auroral sporadic E echoes (Esa) and discrete aurora. The investigation of 49 latitudinal scans through the auroral oval during times of low magnetic activity revealed the existence of a particle produced E layer which is oval aligned, is 2 deg to 6 deg wide in corrected geomagnetic latitude and occurs at all corrected geomagnetic times. This layer produces the night E echoes. A new ionogram analysis procedure, which uses oblique incidence F-layer echoes, is demonstrated, and the feasibility of monitoring the latitude of the southern edge of the polar F-layer irregularity zone by using this new analysis procedure is demonstrated.

A METHOD FOR DIRECT DETERMINATION OF REAL HEIGHT FROM VIRTUAL HEIGHT DATA FOR THE AURORAL REGION OF THE IONOSPHERE Environmental Research Papers. Interim Report
Milton M. Klein 14 Nov. 1979 21 p refs
(AF Proj. 4643)
(AD-A083139; AFGL-TR-79-0276; AFGL-ERP-684) Avail: NTIS HC A02/MF A01 CSCL 04/1

As part of an effort to determine electron density profiles in the auroral region of the ionosphere, a method has been developed for directly calculating real height from virtual height data obtained at high latitudes. The essential ingredient of the method is the representation of the curved portion of the ordinary ray dispersion curve by an analytic form which reduces the virtual height - real height integral relation to a form of Abel's integral equation. Numerical checks indicate that the present method gives an accurate representation of the dispersion curve. The correctness of the present procedure has been verified for the case of a linear electron density profile. The present method will be applied

in the auroral region from virtual height data. The accuracy and convenience of the present method will be assessed by comparison of the results with those obtained from standard programs. GRA

MARINE BOUNDARY LAYER SAMPLING, FLIGHT NO. 2 Environmental Research Papers. Interim Report
Ian D. Cohen 11 Oct. 1979 73 p refs
(AF Proj. 317J)
(AD-A083158; AFGL-TR-79-0242; AFGL-ERP-678) Avail: NTIS HC A04/MF A01 CSCL 04/2

On 22 March 1979, an instrumented MC-130E for cloud physics measurements by AFGL made a series of 8 min sampling passes at altitudes ranging from 100 to 1000 ft above the ocean surface off the coast of Washington. The flight profile was similar to that flown by the same aircraft on 10 July 1978 off the coast of California (AFGL-TR-79-0013). Winds were light, and the visibility generally was 7 miles or greater. Varying numbers of particles were detected in the 2 to 22 micrometer range at all levels. The number of particules was fairly constant with altitude; liquid water content (LWC) was about 0.001 g/cu m at all levels. This was in contrast to the 10 July 1978 flight, where LWC varied much more, both with height and location. The differences between the two flights are attributed to the lower windspeeds and the resultant fewer whitecaps observed on this second flight. GRA

This report provides a summary of high latitude ionospheric reflectivity as observed by the USAF high resolution VLF/LF ionosounder operating in northern Greenland. Ionospheric reflectivity parameters, including reflection heights and coefficients, are presented as a function of time of day. VLF long path propagation measurements, along with magnetometer and riometer data, are presented as supplementary data. GRA

EFFECTS OF IMPULSIVE HEATING EVENTS ON F-REGION CHEMISTRY AND ELECTRON DENSITY Topical Report, Mar. 1978 - Jul. 1979
John D. Kelly 31 Jul. 1979 41 p refs
(Contract DNA001-77-C-0042)
(AD-A083333; AD-E300727; NDA-5028T; HAES-Rept-81) Avail: NTIS HC A03/MF A01 CSCL 04/1

The Chatanika incoherent rada was used to study the ionospheric effects of impulsive auroral heating events. In some cases, the time integrated auroral energy deposition is similar in magnitude to that expected from a high altitude nuclear event outside the fireball region. The resulting ionospheric effects are significant. The elevated temperatures and atmospheric heave contribute to s substantial change in F region ion chemistry, changing the domainant F region ion from atomic to molecular species. As a result, a significant depletion of the F region electron density occurs. Currently these effects are not accurately predicted by the nuclear codes, as the function of the codes is to predict the large-scale perturbations. The Chatanika radar data can be used to improve the ambient ionospheric models and to improve the predictions of F region changes resulting from sudden heating events. Author

NONLINEAR EQUATORIAL SPREAD F: SPATIALLY LARGE BUBBLES RESULTING FROM LARGE HORIZONTAL SCALE INITIAL PERTURBATIONS
S. T. Zalesak and S. L. Ossakow 6 Feb. 1980 44 p refs
Sponsored in part by DNA, Washington, D.C.
(AD-A083393; AD-E000391; NRL-MR-4154) Avail: NTIS HC A03/MF A01 CSCL 04/1

Motivated by the observations of large horizontal scale length equatorial spread F 'bubbles', we have performed numerical simulations of the nonlinear evolution of the collisional Rayleigh-Taylor instability in the nighttime equatorial ionosphere, using large horizontal scale length initial perturbations. The calculations were performed using a new, improved numerical code which utilizes the recently devaloped, fully multidimensional flux corrected transport (FCT) techniques. We find that large horizontal scale initial perturbations evolve nonlinearly into equally large horizontal scale spread F bubbles, on a time scale as fast as that of the corresponding small horizontal scale length perturbations previously used. Further, we find the level of plasma depletion inside the large scale bubbles to be appreciably higher than that of the smaller scale bubbles, approaching 100%, in substantial agreement with the observations. This level of depletion is due to the fact that the plasma comprising the large scale bubbles has its origin at much lower altitudes than that comprising the smaller scale bubbles. Analysis of the polarization electric fields produced by the vertically aligned ionospheric irregularities show this effect to be due to fringe fields similar in structure to those produced at the edge of a parallel plate capacitor. EMPIRICAL STUDIES OF THE RELATIONSHIPS BETWEEN EMISSIONS AND VISIBILITY IN THE SOUTHWEST Interim Report, May 1978 - Mar. 1979
Marilyn Marians and John Trijonis Sep. 1979 118 p refs
(Grant EPA-802815)
(PB80-156136; EPA-450/5-79-009) Avail: NTIS HC A06/MF A01 CSCL 04A

Historical emission trends of SOx, NOx, and NMHC are determined year-by-year from 1948 to 1975 for four Southwestern states (Arizona, Colorado, Nevada, and Utah). Trends in visibility levels (medians and other percentiles) are documented for the period 1948-1976 at 12 airports in the Southwest. Two analyses are used to relate emission changes to variations in regional extinction levels. The first analysis examines the air quality changes associated with a 90 percent reduction of Southwestern SOx emissions during a nine month copper strike and estimates the extinction produced by SOx emissions on various spatial scales. The second analysis involves regression studies relating historical extinction levels from 1948-1975. Because of limitations in the analytical methods, there is a high degree of uncertainty in many of the results. However, the studies do provide insights into the effects of aerosol precursor emissions on extinction at various distances from sources. In the case of mesoscale effects of SOx in the Southwest, quantitative coefficients are proposed which link emissions to regional extinction. GRA

THE NOAA SEL HF RADAR SYSTEM (IONOSPHERIC SOUNDER)
R. N. Grubb Oct. 1979 22 p refs
(PB80-160989; NOAA-TM-ERL-SEL-55; NOAA-80012206) Avail: NTIS HC A02/MF A01 CSCL 04A

The Space Environment Laboratory of the National Oceanic and Atmospheric Administration has developed a new general purpose computer based system for pulsed RF measurements of the ionosphere in the 100 kHz - 30 MHz frequency range. This is a development of the earlier Dynasonde concept to permit full digital signal processing of returned echoes, a dual channel receiver to enable faster measurements of wave polarization and direction of arrival, and a considerably enhanced data process and display capability. The system philosophy adopted is discussed and some details of the implementation and performance of the instrument are given. A number of instruments are now being produced for various institutions which will form the basis of a coordinated research program over the next ten years. GRA

Updated correlations relating seismic velocity and Poisson's

ratio with depth and various geotechnical parameters for different soil and rock classifications found in Southern California are presented. Prior data are incorporated with 48 new velocity measurements. Shear-wave and compressed wave velocity is presented together with supporting geotechnical data. Statistics are compared for each classification for surface and near surface waves and for Poisson's ratios. Correlations to depth are presented for a few of the classifications for which sufficient data are available. The geotechnical parameters significant to seismic velocity and Poisson's ratio include geologic age, gravel content, water table depth, dry density, and depth of overburden. GRA

In many valleys of the semiarid West valley floors are either flat and vegetated without a channel, or they are gullied. Using previously collected data from the Piceance Creek area of western Colorado, it is possible to identify a valley-slope threshold above which, for a given drainage area, gullying is probable. Below this valley-slope threshold, the valley floors are stable; above it they are susciptable to gullying. When the relations and techniques developed in western Colorado were applied to the Chalk Bluffs area of northeastern Colorado, it was determined that valley width was also a significant factor determining valley stability, and a ratio of valley slope to valley width could be used to identify at a given drainage area a threshold zone of velley floor instability. RESPONSE TO SUBTROPICAL MARINE BOUNDARY-LAYER CLOUDINESS TO LARGE-SCALE FORCING Ph.D. Thesis
Howard Paul Hanson 1979 161 p
Avail: Univ. Microfilms Order No. 8014169

Clouds in the undisturbed trades are modeled with focus on the similarities and differences between the stratocumulus regime and the trade cumulus regime. Vertical mixing processes are separated into small scale quasi isotropic turbulence and large scale convective updrafts and compensating subsidence between the clouds. As a lowest order approach cloud area, lateral cloud entrainment and detrainment by evaporating clouds are taken to be constant with height. The budgets of heat and water are solved to obtain thermodynamic profiles in the boundary layer Cloud base is found as the lifting condensation level for near surface parcels and cloud top height is found by a simple closure on the small scale turbulence. The cloud base convective updraft velocity is found from a circulation integral of the vertical equation of motion. Results show that cloud area decreases with increasing surface temperature and decreasing large scale divergence. If the surface temperature is large enough or the large scale divergence low enough, the model breaks down corresponding qualitively to the onset of deep convection. Associated with decreases of cloud area is the result that the vertical mixing processes take on larger scales, i.e., the contribution of overall mixing by the convective updrafts increase relative to the small scale turbulence. Dissert. Abstr.

NUMERICAL SIMULATION OF HURRICANES USING RADAR AND SATELLITE-DERIVED RAINFALL Ph.D. Thesis
John Ernest Molinari 1979 141 p
Avail: Univ. Microfilms Order No. 8014139

Rainfall rates determined from airborne radar data and infrared satellite images are used to specify the heating rate in a three dimensional primitive equation simulation of Hurricane Anita (1977) on a 0.1 degree latitude-longitude mesh. Initial winds from all available sources are analyzed at several levels and initial pressure and temperature are computed via the reverse balance equation and hydrostatic equation. A dynamic initialization procedure is developed for hurricane models by specifying the time dependent heating during a twelve hour pre-forecast integration, after which the heating is computed internally by the model. The specified heating forces the initial wind and mass fields toward a realistic initial state, and produces improved 12 and 24 hour forecasts of both position and intensity compared to a control integration, for which the heating was computed internally by the entire period. Calculations indicate that a significant term in the momentum balance is the inward flux of momentum by azimuthal eddies at 200 mb. This large contribution is produced both by eddies associated with asymmetries in the rainfall pattern and interactions with the storm environment. Dissert. Abstr.

PRELIMINARY INVESTIGATIONS OF THE ELECTRICAL RESPONSE OF WATER SURFACES DURING MARINE THUNDERSTORMS Ph.D. Thesis
Ray Brewer Toland 1979 99 p
Avail: Univ. Microfilms Order No. 8014036

Laboratory and field experiments were devised and carried out to evaluate some of the effects of intense electric fields on water surfaces during marine thunderstorms. The field experiments included employment of: (1) corona-detection antennas on floats for measuring maximum potential gradients over water; (2) Faraday cages to determine space charge density near shorelines; and (3) long, thin, horizontal wires for measuring corona current and estimating potential gradients near shorelines. Laboratory experiments included use of physical models of Worthington jets and gentle waves for determining effective field intensification due to waves, and a laboratory simulator that produced intense bubbling and splashing in known electric fields for measuring electric current densities due to corona and levitated water drops. An explanation of each apparatus and a theory of its operation are given. Results from the field experiments indicate that during thunderstorms over water, surface electric fields often attain maximum values of 30 to 50 kV/m. Two values greater than 100 kV/m have been measured, and there is some evidence that short peak values of even greater magnitude occur. Corona current, electric field intensity, and space charge density data from marine thunderstorms on 30 July and 9 August 1978 were analyzed. When fields estimated at 30 kV/m occurred near brackish water, corona currents of 10E-6 A/m flowed from a long wire apparatus to ground. Space charge densities at the shoreline, in the presence of 5 m/sec sea breezes were commonly 1000 to 2000 el. ch. cmE-3 during the same storms. The sign of the space charge was usually positive near sea water and was negative near fresh water. Dissert. Abstr.

N80-27912 Utah Univ., Salt Lake City.
A CYLINDRICAL CLOUD MODEL FOR MICROWAVE AND INFRARED RADIATIVE TRANSFER-APPLICATIONS TO DEFENSE METEOROLOGICAL SATELLITE PROGRAM MICROWAVE SOUNDERS Ph.D. Thesis
Grant Clifford Aufderhaar 1980 160 p
Avail: Univ. Microfilms Order No. 8016358

Analytic solutions to the thermal radiative transfer equation for one and two dimensional cylindrical geometries for an isothermal cloud cylinder are derived using a truncated spherical harmonics expansion for the intensity and scattering phase function. Case studies are presented utilizing Defence Meteorological Satellite Program microwave sounder data along with standard meteorological data. Calculations for nonprecipitating and clear cases were similar and in good agreement with observations. Precipitating cloud cases were simulated well by the cylinder model, while the plane-parallel model failed in cases with higher rainfall rates. Finally, temperature profile retrievals were performed using the Air Force Global Weather Central statistical method. The method was shown to fail in case studies where there was a precipitating cloud in the field of view. Dissert. Abstr.

ACCURACY OF AIRCRAFT VELOCITIES FROM INERTIAL NAVIGATION SYSTEMS FOR APPLICATION TO AIRBORNE WIND MEASUREMENTS
Richard H. Rhyne Jul. 1980 15 p refs
(NASA-TM-81826; L-13616) Avail: NTIS HC A02/MF A01 CSCL 04B

An experimental assessment was made of two commercially available inertial navigation systems (INS) with regard to their velocity measuring capability for use in wind, shear, and long-wavelength atmospheric turbulence research. The assessment was based on 52 sets of postflight measurements of velocity (error) during a 'Schuler cycle' (84 minutes) while the INS was still operating but the airplane was motionless. Four INS units of one type and two units of another were tested over a period of 2 years after routine research flights similar to air-linetype operations of from 1 to 6 hours duration. The maximum postflight errors found for the 52 cases had a root mean square value of 2.82 m/sec with little or no correlation of error magnitude with flight duration. Using an INS for monitoring ground speed during

landway in a predicted high wind shear situation could lead to landing speeds which are dangerously high or low. L.F.M.

X-RAY SPECTRAL CONSTRAINTS ON THE BROAD-LINE CLOUD GEOMETRY OF NGC 4151

S. S. Holt, R. F. Muchotzky, R. H. Becker, E. A. Boldt, P. J. Serlemitsos, A. E. Szymkowiak, and N. E. White Jun. 1980 17 p refs Submitted for publication

(NASA-TM-80726) Avail: NTIS HC A02/MF A01 CSCL 04B

X-ray spectral data from NGC 4151 taken with the Einstein Solid-State Spectrometer (SSS) and the HEAO-1 A-2 experiment cannot be simply reconciled with absorption from a uniform column of cold gas. The SSS data can, however, be explained in terms of a clumped absorber with approximately 10% uncovered fraction and factor-of-two overabundances in Z equal to or greater than 14 elements relative to solar oxygen. It is shown that these and previously reported spectral and variability data can be quantitatively reconciled with absorption arising in the cold clouds responsible for the broad optical line emission if the cloud dimensions are small compared to the central source size. It is suggested that the lack of significant X-ray absorption observed from much higher luminosity Seyferts and quasars is a natural consequence of our picture for NGC 4151. Author

REVIEW OF ATMOSPHERIC GENERAL CIRCULATION MODELS

C. E. Leith *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 13-22 refs Sponsored by NSF (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

The application of general circulation models to the study of climate questions is reviewed. The climate noise problem arising from sampling fluctuations, and the nature of the climate signal or response to external forcing influences necessary for determining predictability of the second kind are discussed. The observed one year lagged correlation in summer temperatures in the North American continent and the observed spatial and temporal correlation properties of the Southern Oscillation in the equatorial Pacific region suggest the existence of slow physical processes coupled into the climate system for which model studies would be valuable. It is pointed out that the understanding of the atmospheric blocking phenomenon could have important consequences for predictions of the first kind arising from internal dynamical solutions of the equations of motion for the climate system. Author (ESA)

MODELS OF THE OCEAN CIRCULATION AND THE GLOBAL HEAT BALANCE

K. Bryan *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 23-40 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

The questions as to what can be learned from existing models about the role of the oceans in the global heat balance, and the potential of ocean models for studying the problem are discussed. It is shown that the least known element in the global heat balance is the role of the ocean in transporting heat poleward and moderating the seasons by heat storage in the upper ocean. The few results available from model calculations that have been analyzed suggest that meridional overturning is the most important mechanism for transporting heat at low latitudes, with horizontal gyres and mesoscale eddies becoming important at higher latitudes. Also the thermohaline circulation and wind-driven overturning act together to transport heat poleward in the trade wind zone. At higher latitudes the wind-driven overturning and the thermohaline circulation tend to oppose each other, diminishing the effectiveness of the ocean meridional heat flux. Author (ESA)

CLIMATE SIMULATIONS WITH SPECTRAL MODELS OF THE ATMOSPHERE: EFFECT OF SPECTRAL TRUNCATION

S. Manabe, D. G. Hahn, and J. L. Holloway *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 41-94 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

The climate simulation performance of three semi-spectral

models differing only in spectral resolution is evaluated and compared. As the spectral resolution is increased, tropical rainbelts become narrower and better defined, subtropical dry zones expand, and the sea level pressure gradient between the subtropics and subpolar regions increases. While these spectral models maintain a level of eddy kinetic energy which is less than observed, they tend to underestimate the transient component of eddy kinetic energy and overestimate the stationary component. In general, the spectral climate models are able to simulate many of the large scale features of climate, and the quality of the simulations tends to improve with increasing spectral resolution. Comparison is made between the performance of these semi-spectral climate models and that of finite difference climate models. With some exceptions, the simulated climate of the spectral models compare favorably with those of the finite difference models of comparable resolution. Author (ESA)

Avail: NTIS HC A99/MF A01

The first atmospheric simulation results from a general circulation model (GCM) are presented. Although the model is still undergoing development and the results should be viewed as preliminary, the model already shows a greatly improved wind and temperature structure. The computed outgoing longwave radiation and albedo are in good agreement with satellite measurements. The strengths of the midlatitude transports of momentum and sensible heat are up to observed values. Much of this improvement can be credited to better numerical treatment, changes in both solar and longwave radiation, inclusion of convective transports of momentum and moisture, and a method of treating the boundary layer and Earth's surface. PERFORMANCE OF THE OREGON STATE UNIVERSITY TWO-LEVEL ATMOSPHERIC GENERAL CIRCULATION MODEL

Michael E. Schlesinger and W. Lawrence Gates. *In* WMO Climate Models: Performance Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 139-206 refs (For primary document see N80-27917 18-47)

(Contract DAHC15-73-C-0181; Grants NSF ATM-77-16923; NSF ATM-77-26406)

Avail: NTIS HC A99/MF A01

A version of the two level atmospheric general circulation model was developed. The model simulates the large-scale distributions of January and July climate with reasonable accuracy including: the primary climatic variables of pressure, temperature, wind, cloudiness, and precipitation; the simulated meridional distribution of the meridional transports of zonal momentum, heat, and water vapor; the elements of the associated heat and hydrologic balances; and the seasonal energy cycle. The most prominent errors of the model are: a tropical Hadley circulation which is too strong and a midlatitude Ferrel circulation which is too weak in both hemispheres; precipitation and evaporation rates which are too large off the east coasts of the winter hemisphere continents; midlatitude stationary eddies and zonal winds which are too strong; and surface air temperatures which are too high in the winter polar regions. The causes of these errors appear to be related to the subgrid scale vertical flux of momentum and to the treatment of the boundary layer. Author (ESA)

COMPARISONS OF OBSERVED SEASONAL CLIMATE FEATURES WITH A WINTER AND SUMMER NUMERICAL SIMULATION PRODUCED WITH THE GLAS GENERAL CIRCULATION MODEL

M. Halem, J. Shukla (MIT, Cambridge), Y. Mintz (California Univ., Los Angeles), M. L. Wu (NAS-NRC), R. Godbole (NAS-NRC), G. Herman (Wisconsin Univ., Madison), and Y. Sud (Sigma Data Services Corp., Inc.) *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 207-253 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01 CSCL 04B

Results are presented from numerical simulations performed with the general circulation model (GCM) for winter and summer. The monthly mean simulated fields for each integration are compared with observed geographical distributions and zonal averages. In general, the simulated sea level pressure and upper level geopotential height field agree well with the observations. Well simulated features are the winter Aleutian and Icelandic lows, the summer southwestern U.S. low, the summer and winter oceanic subtropical highs in both hemispheres, and the summer upper level Tibetan high and Atlantic ridge. The surface and upper air wind fields in the low latitudes are in good agreement with the observations. The geographical distributions of the Earth atmosphere radiation balance and of the precipitation rates over the oceans are well simulated, but not all of the intensities of these features are correct. Other comparisons are shown for precipitation along the ITCZ, rediation balance, zonally averaged temperatures and zonal winds, and poleward transports of momentum and sensible heat. Author (ESA)

THE METEOROLOGICAL OFFICE 5-LAYER GENERAL CIRCULATION MODEL

A. Gilchrist. *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 254-295 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

After a brief description of the main features of the model, results are presented for two separate integrations in which the sea surface temperature, ice cover, and radiation parameters were maintained at their climatological values for January and July. Standard deviations of quantities were calculated from values sampled at daily intervals during the simulation periods. These include sea level pressure, mean 500 mb height, mean rainfall, zonal wind speed, mean meridional circulation, heat transport, zonal momentum transport, and water vapor transport. Author (ESA)

A SIMULATION OF THE JANUARY GLOBAL CIRCULATION USING A SPECTRAL MODEL

B. McAvaney, W. Bourke, and K. Puri. *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 296-317 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

The model uses a semi-implicit time integration algorithm for computational economy, has nine levels in the vertical, and employs a horizontal resolution of up to wave number 15 (rhomboidal truncation). The physical parameterizations employed follow closely those of GFDL. Comparisons of model results from the last 30 days of a 104 day integration for perpetual January insolation are made with observed values, for mean sea level pressure, wind field, temperature, 500 mb geopotential field, precipitation, and radiation flux. NUMERICAL SIMULATION OF THE GLOBAL CIRCULATION OF THE ATMOSPHERE

G. I. Marchuk, V. P. Dymnikov, V. N. Lykosov, V. Ya. Galin, I. M. Bobyleva, and V. L. Perov. *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 318-370 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

A description of the model is presented, which, while based upon previous work in the field, introduces some improvements into the process of constructing the difference approximation of differential equations without violating the properties of initial operators. This includes skew-symmetry of operators which makes

it possible to substantiate theoretically the stability of a computing process on the basis of the easily determined law of conservation of quadratic norms. In the model, the splitting up method serves as a methodological basis for the solution of the difference equations. Theoretical substantiation of the method was consecutively developed for all stages of its application. By employing this method, it is possible to eliminate a strict stability criterion, replacing it with an 'easier' and natural approximation criterion. Two numerical experiments on the simulation of mid-January circulation of the atmosphere were made. Comparisons of the calculated and observed global values of kinetic and available potential energy, and other parameters, indicate that the model can be useful for climate simulation studies.

SIMULATION OF JANUARY CLIMATE WITH A GENERAL CIRCULATION MODEL
V. R. Meleshko, B. E. Shneerov, M. E. Shvets, L. R. Dmitrieva, G. V. Parshina, C. V. Bogachenko, V. A. Ponomarev, E. P. Yushina, L. H. Magazenkov, and D. A. Sheinin. *In* WMO. Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1. Dec. 1979. p 371-408. refs (For primary document see N80-27917 18-47)
Avail: NTIS. HC A99/MF A01

The model is described briefly. Simulation of the January climate was chosen because the atmospheric processes associated with the development and realization of baroclinic instability, as well as interactions between the oceans and the atmosphere, are well exposed in the winter. Comparisons of model output with observations show that the model is capable of simulating some general features of the mean atmospheric circulation in January, namely the temperature, wind and sea surface pressure distributions and the heat and water balance components. Deficiencies of the model concern the inadequate vertical resolution of the model atmosphere, which causes some problems in the description of the heat sources, and poor spectral selectivity of the horizontal diffusion scheme used. The diffusion scheme, based on the deformation approach, damps disturbances with wavenumbers 1 to 4 rather significantly. The ratio of the eddy kinetic energy to zonal energy is approximately 0.28 for January in the present version of the model. Author (ESA)

THE ATMOSPHERIC GENERAL CIRCULATION MODEL
G. J. Boer and N. A. McFarlane. *In* WMO. Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1. Dec. 1979. p 409-460. refs (For primary document see N80-27917 18-47)
Avail: NTIS. HC A99/MF A01

The model, in the developmental stage, contains the following features which make it appreciably different from others: spherical harmonic representation of the variables in the horizontal, semi-implicit time stepping, and subgrid scale diffusion of the Leith type. The model is described in some detail. A 90 day integration using as initial conditions an analysis from the GARP global data set for 4 Nov. 1969 was made. The results, although exhibiting certain apparent difficulties, are not widely at variance with the results of other general circulation models (GCM) or with the observed atmosphere. In particular, the use of a spectral model, together with an appropriate formulation of subgrid-scale dissipation, has apparently overcome one of the shortcomings of grid-point GCM s, namely that of insufficient eddy kinetic energy. RESPONSE OF THE NCAR GENERAL CIRCULATION MODEL TO CHANGED OCEAN SURFACE TEMPERATURE
R. M. Chervin. *In* WMO. Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1. Dec. 1979. p 461-481. refs. Sponsored by NSF (For primary document see N80-27917 18-47)
Avail: NTIS. HC A99/MF A01

Several prescribed change experiments with various versions of the NCAR general circulation model which attempt to assess the sensitivity of the model to changed ocean surface temperatures are reviewed. One such experiment involving altered temperatures in the tropical eastern Pacific Ocean is discussed in detail. The model response in this case features a relative thermally direct circulation driven primarily by the latent heat of condensation. The interaction between the dynamics and thermodynamics is evident since the maximum atmospheric response (in terms of cloudiness and precipitation) to increased ocean surface temperature occurs westward of the largest temperature increases, and the subtropical jet stream north of the prescribed change region is significantly affected. Furthermore, these model results indicate that at least this particular version of the NCAR general circulation model is relatively more sensitive to tropical as opposed to midlatitude ocean surface temperature anomalies. STATISTICAL ASSESSMENTS OF SEA TEMPERATURE ANORMALY EXPERIMENTS
P. R. Rowntree. *In* WMO. Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1. Dec. 1979. p 482-500. refs (For primary document see N80-27917 18-47)
Avail: NTIS. HC A99/MF A01

Two aspects of the statistical assessments of anomaly experiments carried out with atmospheric models are described. The first concerns the interpretation of results of Student's t-test with particular reference to assessing the probability of particular results occuring by chance. The second concerns a correlation technique which can be applied with small samples or when a pair (control and anomaly) of experiments are made with different models. The effects of extratropical anomalies were not detectable using these statistical techniques. The tropical anomalies studies produce highly significant effects in the model tropics. The t-test provides strong evidence of significant effects in other latitude bands, especially the subtropics and (for the tropical Pacific anomalies) middle latitudes of the Northern Hemisphere.

EFFECT OF A PACIFIC SEA-SURFACE TEMPERATURE ANOMALY ON THE CIRCULATION OVER NORTH AMERICA: A NUMERICAL EXPERIMENT WITH THE GLAS MODEL
J. Shukla (MIT, Cambridge) and B. Bangaru (Sigma Data Services Corp., Inc.). *In* WMO. Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1. Dec. 1979. p 501-518. refs (For primary document see N80-27917 18-47)
Avail: NTIS. HC A99/MF A01. CSCL 04B

A numerical experiment was carried out to determine the effect of sea surface temperature anomalies over the Pacific on the circulation over North America. The sea surface temperature (SST) anomaly pattern chosen for this study was similar to the one observed during January 1977. It is shown that a cold sea surface temperature anomaly over the Pacific produces a strong southward flow over the United States and colder temperature in eastern Canada and the United States, as it was observed during the 1977 winter. The results indicate that the SST anomaly over the Pacific can produce a significant downstream effect over the continental United States. Author (ESA)

GENERAL CIRCULATION MODEL EXPERIMENTS USING

GLACIAL PERIOD AND RELATED BOUNDARY CONDITIONS

Jill Williams *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 525-537 refs (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

The NCAR general circulation model was used to simulate the atmospheric circulation with boundary conditions representing those of the last glacial period maximum and a July with extensive snow cover and glacial period sea surface temperatures. A January and July control case was run with present day boundary conditions (albedo, orography, and sea surface temperature). Results of the experiments are presented for the following parameters: sea level pressure; pressure at 6 km; the zonally averaged u component of the wind; and cyclone tracks. Surface temperature, kinetic energy, Hadley circulation, and specific humidity variability are also discussed. Author (ESA)

THE RESPONSE OF THE GODDARD GENERAL CIRCULATION MODEL TO SEA ICE BOUNDARY CONDITIONS

G. G. Herman (Wisconsin Univ., Madison) and W. T. Johnson (Sigma Data Service Corp., Inc.) *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 538-562 refs (For primary document see N80-27917 18-47)

(Grant NsG-5152)

Avail: NTIS HC A99/MF A01 CSCL 04B

The effect of variation in the location of Arctic sea ice boundaries on the model's mean monthly climatology was examined. When sea ice boundaries were at their maximum extent the differences resulted in the January-February climatology. Sea level pressure was higher over the Barents Sea, in the Davis Strait, and in the Sea of Okhotsk. Pressure was lower by as much as 8 mb in the North Atlantic between Iceland and the British Isles, and in the Gulf of Alaska. Pressure rises in the eastern subtropical regions of the North Atlantic and North Pacific accompanied pressure falls in the Gulf of Alaska and Icelandic region. Geopotential heights at 500 mb were more than 100 gpm lower in the Bering Sea, and more than 120 gpm lower in the Icelandic region. Zonally averaged temperatures were cooler by 4 deg C below 3800 mb between 50 deg and 70 deg N with little change elsewhere. Zonally averaged geopotentials were lower by as much as 70 gpm in the mid-troposphere between 50/-70 deg N and zonal winds increased by as much as 3 m/s in the mid-troposphere between 35/-50 deg N. RESPONSE OF THE NCAR GENERAL CIRCULATION MODEL TO CHANGED LAND SURFACE ALBEDO

Robert M. Chervin *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 563-581 refs Sponsored by NSF (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

A series of experiments with a July version of the model was performed to assess the model's response to changes in the prescribed surface albedo for the United States High Plains and the Sahara Desert. These experiments confirm the earlier hypothesis that large scale increases in surface albedo result in reduced precipitation over the prescribed change region and increased precipitation to the south. The statistical significance of the results (both local and global), the physical mechanisms involved, and implications for desertification are discussed. Author (ESA)

SAMPLING CONSIDERATIONS IN ESTIMATING SECOND MOMENT CLIMATE QUANTITIES

Robert M. Chervin *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 1 Dec. 1979 p 582-606 refs Sponsored by NSF (For primary document see N80-27917 18-47)

Avail: NTIS HC A99/MF A01

The inherent variability which exists in the climatic means (monthly, seasonal, etc.) simulated by general circulation models (GCM's) is an analog to the natural variability occurring in real atmospheric statistics derived from observations in several different years. From a sampled ensemble of five independent realizations of a perpetual January version of the NCAR GCM, it is also shown that considerable inherent variability exists in the time average estimates of variance of model fields, that is, there is a sizeable variance of the variance. For this same sampled ensemble, estimates are made of the characteristic time (T sub 0) between effectively independent sample values. These estimates are based on the estimated time average variances and the variances of the means of the means for each realization. Due to sampling consideration, uncertainties also exist in these estimates of T sub 0. Author (ESA)

ON THE SIMULATION OF THE OCEANIC GENERAL CIRCULATION

Y. Mintz *In* WMO Climate models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 607-687 refs (For primary document see N80-27938 18-47)

Avail: NTIS HC A19/MF A01 CSCL 04B

Two global ocean simulations based on the physics of a highly viscous ocean are discussed, one having realistic atmospheric functions for calculating the thermal forcing of the ocean. The velocity field of this model compares reasonably well with the relatively small amount of real data available. Temperature and heat budget components of the model reproduce best the equatorial band of heating. A simulation based upon the physics of a weakly viscous ocean is described, which produces the correct pattern of isotherms. This model has not yet been run to thermal equilibrium. The Gulf Stream and eddies and their influence on the oceanic and atmospheric heat budgets are discussed in the terms of their importance in coupled ocean-atmosphere models. Author (ESA)

THE ANNUAL VARIABILITY OF SEA SURFACE TEMPERATURE: OBSERVATION AND SIMULATION

J.-W. Kim and W. L. Gates *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 688-714 refs (For primary document see N80-27938 18-47)

(Grant NSF OCE-76-80182)

Avail: NTIS HC A19/MF A01

The mean annual variability of the sea surface temperature on the large scale as determined from observations is simulated by two runs of an oceanic general circulation model with and without an imbedded surface mixed layer. The comparative simulations suggest a strong role of turbulent mixing in the mean annual variability of sea surface temperature, whereas an intercomparison of the observed annual variabilities of surface forcing functions and sea surface temperature suggests the importance of the advective redistribution of heat. The turbulent mixing and advection are likely to be important also in modeling the large-scale structure of the short-term interannual variability. Author (ESA)

SIMPLE SEASONAL CLIMATE MODELS
G. R. North and J. A. Coakley (National Center for Atmospheric Research) *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 715-727 refs Sponsored by NSF (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

The largest scales of the zonally averaged temperature, albedo, infrared flux, and solar flux are represented by a few terms in a Fourier-Legendre expansion in latitude and a Fourier series in time. Prior to fitting, the data were symmetrized so that only data from the Northern Hemisphere were used. A simple energy balance climate model is constructed with diffusive heat transport and an albedo value jump on a snow line which follows a specific isotherm. In order to achieve the proper seasonal temperature field it is necessary to consider the land and ocean-covered areas separately. It is suggested that such models might be useful in the study of sensitivity of the temperature field to changes in various climate forming parameters.

RECENT WORK ON HEAT-BALANCE MODELS
Gerald R. North *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 752-765 refs Sponsored by NSF (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

The solution properties of climate models of the Budyko-Sellers type are surveyed. One group of model studies attempts to improve the parameterization in the heat balance equation with better formulas and the latest observational data. A second group involves theoretical studies which are attempts to understand the nature of the climate solutions in a way that is more or less independent of the numerical values of the various empirical constants. Slope stability theorems and parameter independent proofs for certain classes of models are discussed, particularly as they relate to the tendency of models which have ice lines attached to isotherms and assume a constant cloud cover function, to plunge to an ice-covered Earth. The extension of the simple models to include seasonal effect and their failure to explain the Milankovitch effect is mentioned.

THE PERFORMANCE OF A SEASONAL GLOBAL CLIMATIC MODEL. Ph.D. Thesis - MIT
Allan Robock *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 766-802 refs (For primary document see N80-27938 18-47) (Grants NsG-5208; NSF OCD-74-03969)
Avail: NTIS HC A19/MF A01 CSCL 04B

A seasonal global climatic model developed by Sellers is studied. Several changes are made to correct errors in the original model and to allow its use in a time dependent simulation mode. The major changes are in the infrared radiation formulation and in the size of the time steps. The seasonal cycles of surface temperature, wind, ice, snow, albedo, horizontal heat transport, and vertical flux of solar and infrared radiation are compared to recent observations. The seasonal cycle of temperature is fairly well reproduced, but has too small an amplitude in the Northern Hemisphere high latitudes. An overestimate of albedo at the poles is found, which is related to errors in some of the other variables. The sensitivity of the model to CO2 and solar constant (Q) changes is summarized. Doubling the CO2 amount causes a 2.45 K increase in global average surface temperature (T). Increasing Q by 1% increases T by 3.14K. Decreasing Q by 1% decreases T by 4.65K. An annual average version of the model is more sensitive to changes in Q than the model with the seasonal cycle.

EQUILIBRIUM CLIMATIC ZONATION DEDUCED FROM A STATISTICAL-DYNAMICAL MODEL
B. Saltzman *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 803-841 refs (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

A model containing a parameterization of the meridional eddy flux of momentum, as well as most of the important elements of a complete theory of the zonal mean state including the hydrologic cycle is described. The following approximations are applied to the hydrostatic equations governing the zonal and time averaged atmospheric variables: the climatic average is taken for a winter and summer half year; the atmosphere is assumed to be in an equilibrium state; transports due to stationary waves are neglected; and mean zonal motions are assumed to be negligible compared to the surface friction. Calculations for present global boundary conditions show that a satisfactory first approximation to the observed climatic zonation can be deduced, including tha main differences between the seasons and the hemispheres. There is agreement with observations for the energy fluxes and atmospheric heating. When the model is applied to the surface ice conditions prevailing during the glacial maximum at 17,000 BP, an equilibrium state is obtained that qualitatively agrees with other dynamical modeling experiments.Author (ESA)

EXPERIMENTS WITH SOME SIMPLE ZONAL AVERAGE AND LONG WAVE ATMOSPHERIC MODELS
A. A. White *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 842-851 refs (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

Two models using Green's scheme for the parameterization of baroclinic eddies were designed to test the applicability of this scheme in climate-scale integration. Both are two parameter beta plane formulations. Integrations with the zonal average model made for winter and summer conditions give acceptable qualitative reproduction of atmospheric behavior, but with a weak mean meridional circulation. Integration with a long wave winter model shows that forced long waves contribute slightly to the total eddy flux of potential temperature, and more substantially to the total eddy flux of zonal motion.

PERFORMANCE OF THE LAWRENCE LIVERMORE LABORATORY ZONAL ATMOSPHERIC MODEL
G. L. Potter, H. W. Ellsaesser, M. C. MacCracken, and F. M. Luther *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 852-871 refs (For primary document see N80-27938 18-47) (Contract W-7405-eng-48)
Avail: NTIS HC A19/MF A01

The two dimensional model uses primitive conservation equations, and is designed to assess the potential climatic effects of atmosphere and surface perturbations, and to study climatic feedback mechanisms. The model is divided vertically into nine pressure layers. The prognostic variables are temperature, water vapor mixing ratio, surface pressure, and wind velocity. Surface fluxes of sensible heat and moisture and fractional cloud cover are calculated. Precipitation and convection are parameterized. The land surface boundary is divided into layers which may be

snow, ice, or land, with surface temperature calculated by type. The ocean is an isothermal layer 50 m thick, and accommodates sea ice of varying thickness and extent. Data from a two year integration of the seasonal version compare well with other general circulation model experiments and observations for cloud cover, precipitation, air temperature, evaporation, sensible heat flux, albedo, radiative flux, and reflected and absorbed solar radiation. A SEVERELY TRUNCATED SPECTRAL MODEL
Isaac M. Held *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 872-880 refs (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

Results from a two level primitive equation model are summarized in terms of its value in studying climate variability and sensitivity. Numerical experiments were conducted with a two wave, 3 to 6 model. In one set of experiments, surface albedo and cloud were fixed and the solar constant varied. Two versions of the model were utilized, one 'moist' and the other 'dry'. In the dry cases, the poleward flux increases 2.5% for each 1% increase in solar constant. This increase in poleward flux is sufficient to force the meridional temperature gradient to decrease slightly, in spite of the increased meridional radiation gradient. In the moist model, the potential temperature flux increases in high latitude, but not in low latitudes, as the solar constant increases. Other experiments were performed to study the large ice-cap instability. It was found that when the solar constant was lowered a few percent, the ice cap does become unstable to growth, but does not continue growing until the Earth is ice-covered. An additional decrease in the solar constant of 5% is required to destabilize it. Author (ESA)

TRANSPORTS BY NONLINEAR BAROCLINIC WAVES
B. J. Hoskins and A. J. Simmons *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 881-885 refs (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

Integrations were made with a 15 layer primitive equation model which uses a spectral representation in the horizontal, truncated triangularly at total wavenumber N = 42. Some runs were made with a truncation at N = 63. A zonal flow is specified and, for a particular zonal wavenumber, the most unstable normal mode derived. The zonal flow plus the normal mode with a very small amplitude is then used as initial condition for a nonlinear integration. When averaged over their life cycles all the wavenumber 6 baroclinic waves give qualitatively similar transports of momentum and heat. The transport of momentum is principally poleward. The extreme life cycle values of the transport of momentum vary by almost a factor of 3. The wavenumber 9 heat transport remained low level but all the wavenumber 6 disturbances deepened such that the average heat transport varied little with depth. It is seen that baroclinic waves and their transports are very sensitive to wavenumber and to barotropic components in the basic flow. Linear theory does not give a good qualitative indication of momentum transports and gives little idea of the life cycle averaged values of any transport. Author (ESA)

Avail: NTIS HC A19/MF A01 CSCL 04B

A one dimensional energy balance model is presented which contains a time lagged albedo to account for the delayed dependence of continental ice sheets on temperature; it also includes a smoothing of temperature gradients in the tropics to account for the effect of the Hadley circulation on the strong flattening of meridional temperature profiles there. The model exhibits finite amplitude, sustained free oscillations; these oscillations are triggered by a change in the insulation parameter and occur in the absence of any external forcing. This model behavior strongly suggests the possibility of an almost-intransitive mechanism playing a role in glaciation cycles. This behavior also occurs on shorter time scales which might be relevant to the interannual variability of the atmosphere. Author (ESA)

A SIMPLE SEA-ICE/OCEAN-TEMPERATURE OSCILLATOR MODEL
B. Saltzman *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 917-933 refs (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

An idealized, mechanistic, thermodynamic model was considered in which the Earth is covered by ocean and there are no seasonal variations. The rate of melting and freezing at the ice edge is determined from the surface heat balance condition. The heat balance condition includes downward flux of heat at the surface due to short and long wave radiation, atmospheric conduction and convection, evaporation, and subsurface conduction and convection. The ocean heat balance equation is integrated to obtain an equation for the rate of change of the mean ocean temperature. Physical constants and empirical values of climatic variables are used to evaluate the equilibrium values. A linear analysis is shown for one set of values showing the possibility that the terrestrial climatic system can exhibit internal free oscillations having periods ranging up to several thousand years. ZONAL AND SEASONAL RADIATIVE EFFECTS OF A DOUBLING OF ATMOSPHERIC CARBON DIOXIDE CONCENTRATION
V. Ramanathan *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 934-946 refs Sponsored by NSF (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

Results are presented of the seasonal and latitudinal radiative heating of the surface and troposphere for a doubling of the CO_2 concentration from the present day value. It is shown that the vertical distribution of CO_2 radiative heating is a strong function of latitude. At the equator the tropospheric heating is a factor of 2.5 larger than the surface heating while at the polar regions the surface heating is larger than the tropospheric heating by a factor of about 2.5. The results also indicate that at the middle and high latitudes the heating is maximum during summer and minimum during winter. At high latitudes (i.e., poleward of 70/deg) the Southern Hemisphere heating rates are significantly smaller than the Northern Hemisphere heating rates. The seasonal, latitudinal, and interhemispheric differences in CO_2 heating rates are caused by: (1) the temperature dependence of the 15 micrometer Planck function and the opacity of CO_2 hot bands, and (2) the overlap of CO_2 and H_2O bands in the 12 to 18 micrometer region. INFLUENCE OF AIRBORNE PARTICLES ON THE EARTH'S RADIATION BALANCE
Ruth A. Reck *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 947-973 refs (For primary document see N80-27938 18-47)
Avail: NTIS HC A19/MF A01

The Manabe-Wetherald radiative-convective model with parameterized background aerosols was used to demonstrate the radiative, convective, and thermal role of aerosols. Aerosols are found to cool the atmosphere, reduce convection, and increase the planetary albedo. Global seasonal aerosol effects (due to surface albedo changes) are small but polar seasonal effects may be expected to be appreciable. Aerosol optical properties are found to be most important for small sized aerosols and for longer wavelengths. They have been demonstrated to produce nonlinear effects with other simultaneous parameter changes.

Background aerosols produce an order to magnitude less surface temperature change than the same percentage changes in surface albedo and relative humidity. Their thermal effect is one third as significant as the same percentage changes in CO2.

HARMONIC ANALYSIS OF FEEDBACKS: A TRANSFER FUNCTION CLIMATE MODEL

Fred M. Snell, Paul S. Lee, and Paul Wolfson *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 974-994 refs (For primary document see N80-27938 18-47)

Avail: NTIS HC A19/MF A01

The physics describing climate dynamics are represented in a series of operators that transform one climatic data set into another. The relationships between zonally averaged intra-annual climatological data sets are analyzed zone by zone, in order to calculate the cumulative annual gain and the net power weighted and properly phased gain. The calculated relationships are in effect transfer functions mapping one data set onto another either in time (within the annual cycle) or in space (along the meridional coordinate) or both. Annual averaged and zonally averaged climatic statistics are assembled sequentially in a closed loop to create an interannual climate model. It is shown that by altering the distribution of the solar insolation according to the astronomical theory of glaciation proposed by Milankovitch, the resultant temperature field at 71,000 and 24,000 YBP was consistent with that expected at the maximum of the last glacial period, whereas that of 11,000 YBP had markedly warmer poles, probably sufficient for glacial melt.

CLIMATE EXPERIMENTS: ALBEDO EXPERIMENTS WITH A ZONAL ATMOSPHERIC MODEL

G. L. Potter, H. W. Ellsaesser, M. C. MacCracken, and F. M. Luther *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 995-1001 refs (For primary document see N80-27938 18-47)

(Contract W-7405-eng-48)

Avail: NTIS HC A19/MF A01

Experiments were designed to simulate the climatic effects resulting from tropical deforestation and desertification from overgrazing. For the first experiment, the surface characteristics were modified for that fraction of the land surface type that could be characterized as tropical rain forest (0.34) in the latitudinal band from 5 deg N to 5 deg S. Model response included: reduced equatorial absorption of solar radiation; an increase in tropospheric lapse rates; a reduction in evaporation rate; weakened Hadley circulation; and an increase in precipitation in the latitude bands adjacent to the equator. The increased surface albedo and consequent reduced surface absorption of solar radiation associated with the desertification experiment resulted in a similar chain of events except that the effect on the Hadley circulation was reversed. These zonal model experiments with modified surface boundary conditions suggest an initial chain of feedback processes that is largest at the site of the perturbation with the possibility that self-induced growth of the subtropical deserts could serve as a possible mechanism to cause the initial global cooling that then initiates a glacial advance, thus activating the positive feedback loop involving ice-albedo feedback.

DEVELOPMENT OF A SEASONALLY-VERIFIED PLANETARY ALBEDO PARAMETERIZATION FOR ZONAL ENERGY BALANCE CLIMATE MODELS

Starley L. Thompson *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 1002-1023 refs Sponsored by NSF (For primary document see N80-27938 18-47)

Avail: NTIS HC A19/MF A01

A comparison of the monthly observations of planetary albedo was made with a parameterization using the Cess cloud albedo-zenith angle relationship in order to test the suggestion that the latitudinal variation in mean annual planetary albedo appears to be caused largely by the solar zenith angle dependence of the cloud albedo. The parameters and their derivation for ozone absorption Rayleigh scattering, water vapor absorption, dry and wet aerosol scattering, cloud, ocean, and land are shown. Computed and observed zonal distribution of the annual mean planetary albedo show good agreement, as does the seasonal variation. To estimate the relative influence that seasonal variation in temperature and solar zenith angle have on the planetary albedo, an experiment was performed in which the temperature is held fixed at each latitude at its mean annual value. This eliminates all temperature dependent seasonal albedo changes in the parameterization. The use of mean annual temperatures reduces the seasonal albedo variation by about one third.

VIEWS OF THE FUTURE DEVELOPMENT, APPLICATION AND VALIDATION OF GENERAL CIRCULATION MODELS

A. E. Gill *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 1024-1029 ref (For primary document see N80-27938 18-47)

Avail: NTIS HC A19/MF A01

Validation of ocean models for use in air-sea interaction studies involves testing their ability to predict sea surface temperatures. Sufficient data are now available to study both seasonal variations in surface temperature, and variations in currents with periods up to five years. Developments in ocean models and atmospheric models are at a point where linked models should be used to study the southern oscillation. A quantitative measure of the performance of atmospheric models in predicting those fields most relevant for climate questions is suggested.

SOME PERSONAL VIEWS ON THE USE OF GENERAL CIRCULATION MODELS

Abraham J. Oort *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 1030-1036 refs (For primary document see N80-27938 18-47)

Avail: NTIS HC A19/MF A01

It is suggested that general circulation models may be profitably used in the near future to study the pronounced seasonal cycle with superimposed year to year variations in the observed mean temperature of the Earth. Other areas of interest are: polar cap energy balance, the diurnal variation, the role of biology in the chemical evolution of the oceans and atmosphere, and further testing the adequacy of observational networks.

SOME COMMENTS ON THE DESIGN OF MODEL RESPONSE EXPERIMENTS FOR MULTI-TIME-SCALE SYSTEMS

K. Hasselmann *In* WMO Climate Models: Performance, Intercomparison and Sensitivity Studies, Vol. 2 Dec. 1979 p 1037-1047 refs (For primary document see N80-27938 18-47)

Avail: NTIS HC A19/MF A01

It is shown that the natural climatic noise spectrum contains most of its variance in the same frequency range as the response function of the system. In a simple model of natural climate variability, the spectrum is actually given by the system response function applied to white noise. Enhanced signal-to-noise ratios must be obtained by ensemble averaging over a series of experiments, using identical changes in the boundary conditions or initial values, but different noise realizations. A strategy is presented for coupling models designed for different time scale ranges into a combined model covering a broader range of time scales. The more rapidly changing system can be regarded as being in a state of statistical quasi-equilibrium on the time scales characteristic of the evolution of the slowly changing system, and can therefore be parameterized by averaging over a time interval intermediate between the characteristic time scales of the two.

ANALYSIS OF METEOROLOGICAL OBSERVATIONS FROM AN ARRAY OF BUOYS DURING JASIN M.S. Thesis
Hiroshi Ishida Jan. 1980 75 p refs
(Contracts N00014-76-C-0067; N00014-79-C-0004; NR Proj. 083-102)
(AD-A084034; Rept-80-2) Avail: NTIS HC A04/MF A01 CSCL 04/2

Observations of wind speed and direction, air and sea temperature, and solar radiation were obtained from an array of buoys in JASIN. The observations were analyzed to show spatial and temporal variability. Spectra of wind speed and air and sea temperature were computed to illustrate the distribution of variance over periods ranging from 3.5 minutes to 40 days. When plotted on log-log graphs the spectral estimates generally decrease with increasing frequency with slopes between -3/2 and -2. Spectra of air and sea temperature have a peak at the diurnal frequency. When plotted in variance-preserving form, the spectrum of wind speed is consistent with a spectral gap and is qualitatively similar to other observations of low frequency spectra. On the basis of a cross-correlation analysis, it appears that mesoscale eddies propagated with the mean wind speed except during frontal passages. Based on the cross-correlation between wind and air temperature, there is evidence of horizontal roll vortices or organized convection. GRA

A STUDY OF THE USE OF METEOROLOGICAL SATELLITE, WEATHER RADAR, AND INTEGRATED GRAPHICS PRODUCTS IN THE FLIGHT SERVICE STATION SYSTEM Final Report, Nov. 1977 - Mar. 1978
T. D. Boldt Apr. 1980 28 p
(FAA Proj. 131-402-814)
(AD-A084012; FAA-NA-79-38; FAA-RD-79/92) Avail: NTIS HC A03/MF A01 CSCL 04/2

A study was conducted on the use of meteorological satellite imagery, weather radar imagery, and computer-generated meteorological graphics in the automated flight service station (FSS). The present meteorological satellite network and image distribution system is explained. The use of image processing of meteorological satellite imagery was investigated. The National Weather Service, Federal Aviation Administration, and United States Air Force's plans for improved weather were investigated. The use of computer-generated and animated graphics for display of meteorological information was investigated. The study concluded that: (1) satellite imagery could be made available in the near term by utilizing components of the present closed circuit television system; (2) the National Weather Service (NWS) network of WSR-57 weather radars provides the best available information for small area detection and depiction of precipitation; and (3) integration of satellite imagery and weather radar imagery will help the specialist in recognizing and interpreting the information available to him. The study recommended: (1) implementation of present video disc and cathode-ray tube technology for electronically storing, displaying, and sequencing satellite images and NWS facsimile weather charts at FSS's; and (2) various studies as to application of available image processing techniques to meteorological satellite images, application of monochromatic and color displays for satellite imagery, and techniques to automatically derive graphic products from the Federal Aviation Administration Service A circuit. DESERT CONVECTION CLOUDS Final Report, 1 Nov. 1976 - 31 Oct. 1979
Louis Berkofsky Hanscom AFB, Mass. AFGL 12 Feb. 1980 7 p
(Grant AF-AFOSR-3159-77; AF Proj. 2301)
(AD-A083965; AFGL-TR-80-0140) Avail: NTIS HC A02/MF A01 CSCL 04/2

Equipment is being set up to measure various properties of desert clouds. The equipment includes a 3 cm. radar, a 0.86 cm vertically pointing radar, a GMD-1 rawinsonde, 12 weighing bucket rain gauges, cameras for stereophotography of clouds. The measurements will include cloud base, cloud height, growth rate of clouds, cloud base radius, rainfall rates, liquid water content, ambient atmosphere temperature, humidity, wind. Along with the observational set-up, a one dimensional time dependent plume model has been developed for predicting growth of desert clouds. The program is almost completely checked out. Information from the above-mentioned observational program will be used as input data and as verification data for the model. GRA

COMMENTS ON THE SPECIAL ISSUE OF COMMUNICATIONS IN STATISTICS (VOLUME A8, NO. 10) CONCERNED WITH WEATHER MODIFICATION EXPERIMENTS
Jerzy Neyman Nov. 1979 21 p refs
(Contract N00014-75-C-0159; Grant DAAG29-76-G-0167)
(AD-A083628; ONR-79-06) Avail: NTIS HC A02/MF A01 CSCL 04/2

As stated by the Editors of the Special Issue, it was compiled with reference to two of my statements: (1) that much of the current weather modification literature is slanted and unreliable, and (2) that progress in the building of a reliable weather modification technology requires an interdisciplinary study of as many completed cloud seeding experiments as possible. The material published in the Special Issue related to two completed experiments, the Tasmania and the Israeli experiments. It is shown that a realistic appraisal of a completed experiment requires a prolonged effort, including an examination of quite a few relevant publications and, on occasion, some numerical work on published raw data. It appears that an interdisciplinary reanalysis of the Tasmania experiment can contribute to the development of a reliable cloud seeding technology. GRA

MICROPHYSICAL PROPERTIES OF A LARGE SCALE CLOUD SYSTEM Interim Report, 1-3 Mar. 1978
Donald J. Varley 7 Jan. 1980 100 p refs
(AF Proj. 2310)
(AD-A083140; AFGL-TR-80-0002; AFGL-ERP-690) Avail: NTIS HC A05/MF A01 CSCL 04/2

This report describes the microphysical properties observed by a specially-instrumented C-130 while flying in portions of a large cloud system on 3 successive days in March 1978. Each of the flights was made slightly east of an upper level trough as it moved across the U.S. Horizontal sampling passes of 50 to 100 nm (93 to 186 km) in length were made at various levels from approximately 2 to 9 km above ground in portions of the cloud system that were relatively homogeneous horizontally and vertically. Particle spectra data from PMS 1-D spectrometers were averaged for consecutive 20 sec periods. On each of the 3 days the particles having the smallest mean size were observed at the highest levels flown and had median diameters near 100 micrometers. The calculated equivalent liquid water content from 7 to 9 km was near 0.0 1 g cu m. The total particle count was between 8,000 and 18,000 cu m over Arkansas and coastal Delaware, but was near 25,000 cu m over the mountains of New Mexico. Values of mass and particle size increased with particle distance fallen, by indicating growth by collective means. The largest equivalent liquid water content values were near 1 g cu m and were recorded in the large snow just above the freezing level. The form factor, a mathematical parameter, was found useful in studying particle spectra. Certain maxima and minima observed in several plotted spectra, especially those from 7 km altitude data, are suggested as being due to an aggregation mechanism. GRA

SELECT RESEARCH GROUP IN AIR POLLUTION METEOROLOGY Final Report, May 1972 - Mar. 1978
R. A. Anthes, A. K. Blackadar, R. I. Kabel, J. L. Lumley, and H. Tennekes Feb. 1980 87 p refs
(Grant EPA-R-800297)
(PB80-166879; EPA-600/4-80-012) Avail: NTIS HC A05/MF A01 CSCL 04B

The development of a comprehensive mesoscale predictive transport model capable of nesting within a global scale grid system and sufficiently flexible in scale to be used for either regional or urban problems was identified as a central problem in air pollution meteorology. It was found that the treatment of the boundary was sufficiently general to permit application of the model to complex terrain problems. A variety of subsidiary one and two dimensional models for the prediction of mixed layer depth, nocturnal mixed layer evolution and buoyantly driven convection regimes was also developed. Work was also done on deposition processes and on facility development for measurements of air quality and model validation needs. GRA

TURBULENT DIFFUSION FROM A POINT SOURCE IN STRATIFIED AND NEUTRAL FLOWS AROUND A THREE DIMENSIONAL HILL. PART 1: DIFFUSION EQUATION ANALYSIS
W. H. Synder (Cambridge Univ., England), J. C. R. Hunt (Atmospheric Environment Service, Downsview, Ontario), and J. S. Puttock 1979 14 p refs Submitted for publication
(PB80-163058; EPA-600/J-79-048) Avail: NTIS HC A02/MF A01 CSCL 04B

In stable stratified flow around three dimensional hills, vertical motion and vertical diffusion is negligible. Consequently turbulent diffusion from a point source can be modelled by considering horizontal flow and horizontal diffusion. Using an eddy diffusivity, the advective diffusive equation around a three dimensional hill which is axisymmetric about a vertical axis is solved to show how source positions on and off the center line affect the trajectories and splitting of impinging plumes and the value and position of the maximum surface concentration on the hill. A plume is analyzed in a neutrally stable potential flow around an axisymmetric obstacle such as a hemisphere, also using the diffusion equation. The solutions show how, because streamlines approach the surface of a 3 dimensional hill much more closely than the surface of a 2 dimensional hill, the maximum surface concentrations on the hill can become very much greater than in the absence of the hill. But this only occurs for a limited range of source heights. GRA

PROPAGATION AND GENERATION OF INTERNAL TIDES ON THE CONTINENTAL MARGIN Ph.D. Thesis
Wen-Ssn Chuang 1980 126 p
Avail: Univ. Microfilms Order No. 8014265

The propagation of internal tide in the ocean is strongly affected by the effect of bottom topography and the effect of horizontal density stratification. In the particular case of a normal mode internal tide propagating into a region of linearly sloping, subcritical bottom plane and isopycnals, only the weak (discontinuous) solution can be constructed based upon the ray theory. It is shown that part of the incoming energy flux is induced upward along the characteristics at the sloping bottom and across the vertical line where the isopycnals change from level to upward inclination. Dissert. Abstr.

N80-27974 Florida State Univ., Tallahassee.
A MODEL OF A SUSPENDED SEDIMENT INDUCED, STABLY STRATIFIED OCEANIC BOTTOM BOUNDARY LAYER Ph.D. Thesis
Charles Earl Adams, Jr. 1980 77 p
Avail: Univ. Microfilms Order No. 8014108

A suspended sediment induced stably stratified oceanic bottom boundary layer is examined with a second moment turbulence closure model. The boundary layer momentum and mass conservation equations are coupled through the eddy diffusion coefficients for momentum and mass which are functions of the dependent variables of the problem. The bottom boundary layer BBL of the Florida current is modeled using observed geostrophic currents, bottom sediment size distribution and bottom roughness height as input parameters. Model results indicate that the boundary layer response to a suspended sediment concentration gradient is to reduce appreciably the level of turbulence and to modify significantly the velocity profile of the BBL. The turbulent kinetic energy and eddy conductivity are reduced by about 40% and 25% respectively and the bottom stress is reduced by approximately 45%. Dissert. Abstr.

BOTTOM-WATER TEMPERATURE TRENDS IN THE MIDDLE ATLANTIC BIGHT DURING SPRING AND AUTUMN, 1964-76
Clarence W. Davis Dec. 1979 21 p refs
(PB80-166200; NOAA-TR-NMFS-SSRF-739;
NOAA-80012404) Avail: NTIS HC A02/MF A01 CSCL 08J

Annual variations of bottom-water temperatures on the continental shelf between Cape Cod and Cape Hatteras were examined for the spring and autumn from 1964 to 1976. Temperatures generally were highest since 1972 during both seasons. For waters between Cape Code and Hudson Canyon, maximum temperatures occurred in the spring of 1976 (8.3C) and autumn of 1972 (12.8C); between Cape Hatteras and Hudson Canyon, temperatures peaked in the spring of 1974 (9.0C) and the autumn of 1972 (15.7C) GRA

TRANSIENT DIFFUSION IN MULTI-LAYER BIOLOGICAL TISSUE Ph.D. Thesis
Joseph Rasson 1979 126 p
Avail: Univ. Microfilms Order No. 8014852

The oxygen tension profile in the human cornea while a soft contact lens is in situ was investigated to answer some of the questions concerning the clinical application of soft contact lenses. A mathematical model of the cornea contact lens system was developed to predict the transient response of a Clark-type oxygen sensor pressed into the lens. Due to the lack of data on human corneal diffusion parameters, an analysis of the effect of different parameters on the oxygen tension profile was performed. The results indicate that the diffusion properties of corneal epithelium, specifically, its oxygen up-take rate and thickness, have dominant effects on oxygen tension under the lens. These findings could prove useful in determining which individuals can and cannot wear soft contact lenses. The diffusion property of the contact lens, its oxygen transmissibility, also has a significant effect on the oxygen tension under the lens. The agreement between the experimental results and the mathematical model indicates that the diffusion properties of the human cornea which exist in the literature are a reasonable estimation of actual normal diffusion parameters. Dissert. Abstr.

INSTRUMENTATION FOR THE MEASUREMENT OF VISCOSITY AND FLOW OF BIOLOGICAL FLUIDS Ph.D. Thesis
Lawrence Eugene Crooks 1979 223 p
Avail: Univ. Microfilms Order No. 8014642

Several ways to use nuclear magnetic resonance (NMR) to measure properties of fluids were investigated with emphasis on the measurement of fluid flow velocity. The technique also provided a measure of molecular self diffusion which was converted to the fluid's viscosity. The flow characteristic measured was a velocity distribution function which relates the fraction of fluid flowing to the fluid velocity. It is shown that a multiple pulse NMR sequence can be used to determine the velocity distribution. A self diffusion measurement gives the diffusion coefficient of a whole sample, whether it is stationary or flowing. It is also shown that varying the experiment timing, restricted diffusion can be observed and the size of biological miscelles can be estimated. The results of a study of diffusion in cervical mucus are presented. Results indicate that NMR relaxation time can also be used to determine the hemaglobin concentration in whole blood. Results of this type of measurement on leukemic whole blood and various blood fractions are presented. Dissert. Abstr.

EXPERIMENTAL GASTRIC ULCERS INDUCED BY IMMOBILIZATION AND ELECTRIC SHOCK OF RATS AND THEIR PHARMACOTHERAPY
O. N. Zabrodin May 1980 7 p refs Transl. into ENGLISH from Farmakol. Toksikol. (USSR), v. 28, no. 6, 1965 p 717-719 Transl. by Kanner (Leo) Associates, Redwood City, Calif.
(Contract NASw-3199)
(NASA-TM-76157) Avail: NTIS HC A02/MF A01 CSCL 06C

The mechanism of development of experimental gastric ulcers, induced in rats by combined immobilization and electric shock, was analyzed pharmacologically with peripheral neurotropic agents. It is concluded that: (1) The most marked preventive effect in the development of the experimentally induced gastric ulcers was displayed by agents capable of blocking the ascending activation system of the reticular formation. (2) Sympathetic fibers, which disrupt the trophism of the gastric wall, form the efferent portion of the reflex arc. (3) Gastric secretion does not appear to be the primary cause of ulceration. (NASA-TM-76158) Avail: NTIS HC A02/MF A01 CSCL 06C

The immobilization of guinea pigs for 5, 12, 24 and 48 hours, by securing to a slab, results in a persistent rise of the blood plasma 17-oxycorticosteroid concentration. Repeated administration of phenobarbital (50 mg/kg) and of the sodium salt of gamma-oxybutyric acid (500 mg/kg), as well as the combined administration of central m- and n-cholinolytics with small doses of phenobarbital tends to inhibit activation of the adrenal cortex during 48 hour immobilization of the animals. Repeated administration of aminazine (20 mg/kg) tends to decrease activation of the adrenal cortex. The administration of reserpine (0.1-5 mg/kg) 12-18 hours before immobilization of guinea pigs increases the response of the hypophysis-adrenal cortex system. Author

OXYGEN CONSUMPTION OF ANIMALS UNDER CONDITIONS OF HYPOKINESIA
Ye. N. Loginova, A. I. Volozhin, I. G. Krasnyku, and Ye. A. Stroganova May 1980 11 p refs Transl. into ENGLISH from Patrol. Fiziol. Eksp. Ter. (USSR), no. 4, Jul.-Aug. 1975 p 32-38 Transl. by Scientific Translation Service, Santa Barbara, Calif. Original Doc. prepared by Med. Stomatological Inst., Moscow
(Contract NASw-3198)
(NASA-TM-76167) Avail: NTIS HC A02/MF A01 CSCL 06C

The influence of hypokinesia on the oxygen consumption of rats, dog, and squirrels was investigated. Three periods of gaseous exchange were revealed in rats under conditions of a limited motor activity. During the first 10-15 days O2 consumption displayed a sharp elevation; on the 20th-30th day, it became stabilized at a higher level (in comparison with control) and it sharply rose again on the 40th-100th day. In dogs, hypokinesia produced a reduction of O2 consumption and then a tendency to its elevation was seen. A short period of physical exercises in squirrels after hypokinesia led to increased oxygen consumption at rest. R.E.S.

MECHANISMS OF WATER-SALT METABOLISM DISTURBANCES IN DOGS SUBJECTED TO SIX MONTH HYPOKINESIA

V. I. Korolkov, Ye. A. Kovalenko, V. P. Krotov, N. A. Ilyushko, V. A. Kondratyeva, and Yu. I. Kondratyev May 1980 9 p refs Transl. into ENGLISH from Patol. Fiziol. Eksp. Ter. (USSR), no. 6, 1977 p 32-35 Transl. by Scientific Translation Service, Santa Barbara, Calif.

(Contract NASw-3198)

(NASA-TM-76170) Avail: NTIS HC A02/MF A01 CSCL 06C

Water-salt metabolism in dogs during prolonged restricted motor activity (hypokinesia) was investigated. It was found that hydration occurred and fluid was redistributed between the extra- and intra-cellular sectors. Also, electrolyte excretion rose, and magnetism and calcium metabolism changed significantly. It is concluded that the forces caused by muscle strain proper (which was decreased under conditions of hypokinesia) influence the state of bone metabolism. R.E.S.

EFFECT OF IMMOBILIZATION ON THE EEG OF THE BABOON. COMPARISON WITH TELEMETRY RESULTS FROM UNRESTRICTED ANIMALS

J. Bert and H. Collomb Apr. 1980 5 p refs Transl. into ENGLISH from Compt. Rend. Soc. Biol. (France) v. 159, no. 5, 1965 p 1202-1204 Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(NASA-TM-76137) Avail: NTIS HC A02/MF A01 CSCL 06C

The EEG of the baboon was studied under two very different sets of conditions: 37 were totally immobolized while 12 were studied in their free movements with 4 channel telemetry. For the immobilzed, 3 stages were described: (1) activation, record desynchronized; (2) rest with 13-15 cm/sec rhythm, like the human alpha rhythm stage but with eyes open or closed; (3) relaxation with a decrease in 13-15 rhythm and the appearance of 5-7 cm/sec theta waves, eyelids closed, animal apparently sleeping. For the free animals the rest stage appeared when the animal's attention was not directed anywhere and there was no relaxation stage. It is concluded that the EEG pattern of the immobilized animal that was described as the 'relaxation' stage really represents a special functional state which one must distinguish clearly from the physiological stages of sleep. R.E.S.

N80-27988*# National Aeronautics and Space Administration, Washington, D. C.

CALORIGENIC EFFECT OF ADRENALINE IN RATS UNDER CONDITIONS OF RESTRICTED MOTOR ACTIVITY

L. Tomaszewska, H. Kaciuba-Uscilko, and S. Kozlowski Jun. 1980 8 p refs Transl. into ENGLISH from Artif. Satell. (Poland), 1/2, 1973 p 75-80 Presented at Symp. on Cosmic Biol. and Med., Warsaw, 12-17 Jun. 1972 Translation was announced as A74-20558 Transl. by Scientific Translation Service, Santa Barbara, Calif.

(Contract NASw-3198)

(NASA-TM-76192) Avail: NTIS HC A02/MF A01 CSCL 06C

In previous studies, it was demonstrated that long term restricted motor activity in rats induces a decrease in body weight, an increase in release of adrenaline, and a decrease in the release of noradrenaline with the urine, as well as a reduction in activity of the thymus gland and level of thyroxin in the blood. At the same time, a decrease was found in the internal body temperature that was accompanied by an increase in the rate of metabolism in the state of rest. An investigation is presented which attempts to clarify whether the calorigenic effect of adrenaline under conditions of increased metabolism in the period of immobility is exposed to changes. R.E.S.

DISPLACEMENT OF PLASMA PROTEIN AND CONDUCTION VELOCITY IN RATS UNDER ACTION OF ACCELERATION FORCES AND HYPOKINESIA

S. Baranski, Z. Edelwejn, and M. Wojtkowiak Jun. 1980 10 p refs Transl. into ENGLISH from Postepy Astronautyki (Poland), v. 5, no. 2, 1972 p 61-70 Original language document annouced as A73-17769 Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prep. by Military Academy of Aviation Medicine, Warsaw

(NASA-TM-76195) Avail: NTIS HC A02/MF A01 CSCL 06C

The permeability of capillary vessels was investigated in order to determine if acceleration alone or following prolonged hypokinesia would induce changes in the vascular wall leading to the penetration by I-albumins and/or proteins with larger molecules. In rats undergoing action of +5 Gz accelerations, no increase in vascular permeability, as tested with the use of (Cr-5k)-globulin, was demostrated. In rats immobilized for 4 weeks before centrifugation, rather weak migration of (Cr-51)-globulin from the vessels was observed. Immobilization resulted also in lowering of conduction velocity in the sciatic nerve. R.E.S.

EFFECTS OF HYPODYNAMIA ON THE HEMOCOAGULATIVE PROPERTIES OF THE VASCULAR WALL AND MYOCARDIUM

V. I. Inchina Jun. 1980 9 p refs Transl. into ENGLISH from Kardiologiya (USSR),v. 18, no. 3, Mar 1978, p 126-129 Transl. by Kanner (Leo) Associates, Redwood City, Calif.

(NASA-TM-76199) Avail: NTIS HC A02/MF A01 CSCL 06C

The hemocoagulative properties of the aorta (laminar), myocardium, hollow veins, and fibrinolytic capacity of tissues were studied in 14 rabbits subjected to 7 days of restricted mobility and compared to those of 10 control animals. Two tables of results show that, as a result of hypodynamia, the thromboplastic activity of the inner and middle layers of the aorta together with the destruction of endothelium increases the hemocoagulative potential and creates the threat of thrombogenesis. There is also an increase in fibrin-stabilizing activity for all tissues.

RESULTS OF STUDIES OF PULSED BLOOD FLOW AND REGIONAL VASCULAR TONUS DURING FLIGHTS IN THE FIRST AND SECOND EXPEDITIONS ABOARD THE SALYUT-6 - SOYUZ ORBITAL COMPLEX **c52**

V. F. Turchaninova and M. V. Domracheva *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 13-18 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 11-14 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

The dynamics of pulse blood filling and regional vascular tone was studied in the crewmembers of 96 and 140 day flights aboard the station Salyut-6 - Soyuz. Measurements were taken before, during and after flights, using a specially designed tetrapolar rheography. Rheograms of the torso, forearms, legs, and rheoencephalograms of the right and left hemispheres in the frontal-mastoidal lead were recorded. The results show that in zero-g the cosmonauts developed typical hemodynamic changes indicative of cephalad blood shifts.

Kobzev *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 19-23 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 15-18 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

During the 96 day flight aboard the Salyut-6 station the crewmembers showed a satisfactory response to bicycle ergometry of moderate load. However, cardiovascular regulation during exercise declined, particularly by the end of the first and the begining of the second month. This was mainly associated with deconditioning due to an inadequate work load. Its increase helped to restore an initial level of circulation during exercise by the end of the mission.

ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 18-21 (For primary document see N80-27994 18-51)
Avail: NTIS HC A08/MF A01

In the Salyut-5 flight studies of circulatory functions were continued. Heart rate, arterial pressure, time intervals of the left and right ventricles were measured at rest. Peripheral resistance and cardiac output were calculated. At early flight stages cardiovascular changes occurred due to an increased blood inflow to the heart. During the second half of the mission cardiac output and arterial pressure remained elevated, as fatigue of the cosmonauts increased. Author

EFFECT OF WEIGHTLESSNESS AND ARTIFICIAL GRAVITY ON ION-REGULATING FUNCTION OF RAT KIDNEYS

Ye. A. Ilin, Yu. V. Natochin, N. A. Ilyushko, Yu. I. Kondratyev, V. T. Bakhteyeva, Ye. M. Gazhala, O. A. Gomcharevskaya, Ye. A. Lavroua, and Ye. I. Shakhmatova *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 29-34 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 21-25 (For primary document see N80-27994 18-51)
Avail: NTIS HC A08/MF A01

Weightless rats showed greater changes in the fluid-electrolyte metabolism and ion regulatory function of the kidneys than centrifuged rats. During water loads they exhibited an increased sodium excretion. During potassium loads they displayed a higher potassium excretion. The study of electrolyte composition of different kidney segments demonstrated a reduced potassium content in the wet cortical and medullary matter due to elevated tissue hydration. Kidney microdissection did not reveal any structural differences in nephrons of the weightless and centrifuged rats. Author

ACTIVITY OF SOME HEPATIC ENZYMES AND LIPOGENETIC PROCESSES IN RAT AIPOSE TISSUE AFTER SPACE FLIGHT

L. Makho, Sh. Nemet, M. Palkovich, V. Shtrbak, and R. A. Tigranyan *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 35-40 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 26-29 (For primary document see N80-27994 18-51)
Avail: NTIS HC A08/MF A01

The rats flown aboard Cosmos-782 showed a significant increase in the activity of tyrosine aminotransferase and tryptophan pyrolase, i.e., the enzymes whose activity depends on the corticosterone level. The synchronous rats displayed a small increase in the enzyme activity. The flight and synchronous animals exhibited a slight increase in the activity of gluconeogenetic enzymes and a decrease in the activity of glucose-6-phosphatase. Immediately after flight and, to a lesser extent, after the synchronous experiment the activity of lipogenetic enzymes decreased. On the R+25 day the enzyme activity remained unchanged. The study of lipogenesis in the epididymal fat, using C14-glucose incorporation into lipids, did not reveal any differences in the flight and synchronous rats. The findings demonstrated that changes in the enzyme activity induced by the flight and synchronous experiments returned to the normal during readaptation. Author

STATE OF RAT THYROID C CELLS FOLLOWING FLIGHTS ON THE COSMOS TYPE OF BIOSATELLITES (ACCORDING TO RESULTS OF A MORPHOLOGICAL STUDY)

G. I. Plakhuta-Plakutina *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 41-46 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 29-33 (For primary document see N80-27994 18-51)
Avail: NTIS HC A08/MF A01

Calcitonin-secreting cells (C-cells) of the thyroid glands from 51 SPF Wistar rats flown for 18.5 to 22 days aboard biosatellites Cosmos-605, 782 and 936 and sacrificed 4.5-13 hours, 1-2 and 25-27 days after recovery were examined histologically and karyometrically. Vivarium (57) and synchronous (58) rats were used as controls. Variations in the nuclear volume of C-cells and their density were shown to depend on the experimental conditions and time interval elapsed after recovery. Morphological changes in C-cells were assumed to be associated with alterations in calcium metabolism during an exposure of rats to weightlessness, artificial gravity, and Earth gravity. Author

Avail: NTIS HC A08/MF A01

With an increase in acceleration value, the accuracy of human performance decreases. This becomes very noticeable at $+Gz > 5$ g. In this situation work capacity can be raised by increasing an angle between the Gz vector and the long axis of the human body. Pilots need to be tested for acceleration clearance before they are allowed to fly at $+Gz >$ or $= 8$ g. Author

EFFECT OF TRANSVERSE ACCELERATIONS ON INNERVATION OF THE GUINEA PIG'S CRURAL SKELETAL MUSCLES

V. Ya. Osaulenko *In its* USSR Rept.: Sapce Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 65-71 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 44-48 (For primary document see N80-27994 18-51)
Avail: NTIS HC A08/MF A01

Guinea pigs were exposed to chest-to-back acceleration of 8 G for an hour. This exposure brought about significant

morphological changes of a primary-reactive pattern in nerve elements of skeletal leg muscles. With time they enhanced: 6 hours and then 3 days after the experiment a small portion (1-1.5%) of nerve fibers underwent fragmentation and degradation. Motor nerve endings showed the highest resistance. The first signs of restitution of changes in the peripheral nervous system were seen 6 days after the exposure. Nerve fibers did not return to the normal 9 days after the beginning of the experiment.

STUDIES OF PROGNOSTIC SIGNIFICANCE OF ANTIORTHOSTATIC POSITION **c52**

Kh. Kh. Yarullin, V. A. Gornago, T. D. Vasilyeva, and M. Ye. Gugushvili. *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 72-80 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 48-54 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

The prognostic significance of head-down tilt at -15 deg and -30 deg for 6 min at each step was assessed in 40 normal men, aged 22 to 39. The study of mean values of the maximal amplitude, relative duration of the anacrotic phase, dicrotic, and diastolic indices of hemispheric and bimastoidal rheoencephalography as well as of health condition helped to determine cerebral circulation in test subjects with good and moderate tolerance to head-down tilt and to define the criteria of tilt tolerance. The test subjects who showed good tolerance to head-down tilt displayed a simultaneous compensatory increase of the tone of large caliber arteries and arterioles that was accompanied by a noticeable increase in cerebral pulse blood filling at -15 deg and a moderate increase at -30 deg as well as the feeling of a slight blood rush to the head. The test subjects who displayed moderate tolerance to heat-down tilt showed only an increase in the tone of large caliber vessels; they also exhibited a marked decrease in the tone of arterioles, venules, and veins (especially at -30 deg) which was combined with a significant increase in the cerebral pulse blood filing and an appearance of marked venous waves on rheoencephalograms.

THE STRESS REACTION TO HYPOKINESIA AND ITS EFFECT ON GENERAL RESISTANCE **c52**

I. P. Chernov. *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 86-90 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 57-60 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

Rat experiments demonstrated that the development of the hypokinetic syndrome involves occurrence of a three stage, stress reaction characterized by a change in the general health state, body mass, and activity of the hypothalamic-pituitary-adrenal system. The hypokinetic stress affects total resistance and ionizing radiation sensitivity of animals. At a certain stage of development the hypokinetic stress contributes to the state of elevated cross resistance.

REGIONAL REDISTRIBUTION OF RAT BLOOD AFTER 7 AND 30 DAYS OF HYPOKINESIA

O. A. Kovalev, V. F. Lysak, V. I. Severovostokova, and S. K. Sheremetevskaya. *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 91-96 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 60-64 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

An exposure of rats to hypokinesia was accompanied by a significant increase in the total amount of circulating blood per unit body mass. The percentage blood content was increased in the myocardium, lungs, liver, kidneys, small intestine, muscles and bones of the chest. The percentage blood content was decreased in the skin of different body segments, muscles and bones (except of the chest), tail, viscera (large intestine, adrenals, spleen, bladder, testes). The major regional redistribution of blood was its displacement into the liver.

METHOD FOR ASSESSING HEMODYNAMICS AND DETECTING LATENT INSUFFICIENCY OF CEREBRAL CIRCULATION IN COSMONAUT CANDIDATES **c52**

D. A. Alekseyev. *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 110-116 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 71-74 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

Experience in screening cosmonaut candidates shows that many of them present osteochondrosis of the cervical spine. In some of the selected individuals, the signs of intervertebral osteochondrosis are progressing. Osteophytes in this region

sometimes cause ischemic circulatory disturbances in the vertebrobasilar system as a result of reflex angiospasm of vertebral arteries and mechanical compression of the latter. For this reason, it is very important to assess blood flow in the systems of the vertebral arteries (basilar and internal carotid) and determine the functional capabilities of collaterals and latent circulatory disturbances in the corresponding vascular reservoirs. A functional test used for this purpose, involving rotation of the head and throwing it back to an angle of 45 deg is described. J.M.S.

ISOLATION AND GAS CHROMATOGRAPHIC DEMONSTRATION OF VOLATILE ORGANIC SUBSTANCES IN THIN-LAYER BIOLOGICAL SAMPLES

N. F. Sopikov and A. I. Gorshunova. *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 3, 1980 (JPRS-75956) 27 Jun. 1980 p 122-127 refs. Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (Moscow), v. 14, no. 3, 1980 p 77-79 (For primary document see N80-27994 18-51)

Avail: NTIS HC A08/MF A01

Gas chromatographic methods are used to demonstrate organic compounds in studies of the effects of space flight factors and conditions (for example, hypokinesia, radiation, hypoxia, etc.) on processes of accumulation, distribution and elimination of volatile chemicals from the human and animal organism. A simple and rapid method was developed for isolating volatile organic substances from biological media and tissues to be submitted to gas chromatographic analysis. This method was based on the principle of direct thermal evaporation of volatile compounds from thin layer biological samples, obtained by using a pyrolytic attachment with the chromatograph. J.M.S.

PRINCIPAL RESULTS OF PHYSIOLOGICAL EXPERIMENTS WITH MAMMALS ABOARD THE COSMOS-936 BIOSATELLITE

O. G. Gazenko, Ye. A. Ilin, A. M. Genin, A. R. Kotovskaya, V. I. Korolkov, R. A. Tigranyan, and V. V. Portugalov. *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 33-37 refs. Transl. into ENGLISH

from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 22-25 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

The program of the 18.5 day flight of the biosatellite Cosmos-936 included studies of physiological effects of prolonged weightlessness (20 rats) and artificial gravity (10 rats). The latter produced a normalizing effect on the function of the myocardium, musculo-skeletal system, and excretory system. Simultaneously, artificial gravity exerted an adverse effect on the functions dependent on several sensors, primarily optic, vestibular, and motor sensors. It is postulated that the adverse effects are associated with a relatively high rate of rotation and a short arm of the centrifuge. Author

ROLE OF DYNAMIC SPACE FLIGHT FACTORS IN THE PATHOGENESIS OF INVOLUTION OF LYMPHATIC ORGANS (EXPERIMENTAL MORPHOLOGICAL STUDY)

A. S. Kaplanskiy and G. N. Durnova *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 45-52 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 30-35 (For primary document see N80-28015 18-51)
Avail: NTIS HC A02/MF A01

The role of the dynamic factors in accidental involution of lymph organs was investigated in a ground based study simulating a 20 day space flight. It is inferred from the study that lymph organ involution observed in rats exposed to prolonged space flights is caused by chronic and acute stresses. Chronic stress is associated with weightlessness and leads to hypoplasia of lymphs organs; acute stress is connected with the transition from weightlessness to normal gravity (gravity stress), thus enhancing chronic stress induced lymph tissue hypoplasia. Spleens of both weightless and hypokinetic rats slow inhibition of crythropoiesis and accumulation of hemosiderine due to accelerated erythrocyte degradation caused by diminished motor activity. J.M.S.

DYNAMICS OF HUMAN EXTERNAL RESPIRATION AND BLOOD GASES UNDER THE COMBINED EFFECT OF HYPERCAPNIA AND HYPOXIA c52

L. Kh. Bragin, A. Ye. Severin, N. A. Agadzhanyan, G. A. Davydov, and Yu. A. Spasskiy *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 58-62 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 38-41 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

In manned experiments gas mixtures with a step-by-step increasing (p)CO2 and hypoxia of different levels were used. The experiments demonstrated variations in respiration, buffer systems, and gases of the blood. The studies emphasized an important physiological role of a constant (p)CO2 in blood, when breathing gas mixtures with a different O2 content. Author

FUNCTIONAL STATE OF THE CARDIOVASCULAR SYSTEM UNDER THE COMBINED EFFECT OF 28 DAY IMMERSION, ROTATION ON A SHORT-ARM CENTRIFUGE AND EXERCISE ON A BICYCLE ERGOMETER c52

I. F. Vil-Vilyams and Ye. B. Shulzhenko *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 63-68 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 42-45 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

The cardiovascular function of four test subjects exposed to 28 day dry immersion was examined before and after 6 day cycles of rotation in a short-arm centrifuge to provide 1 to 2 Gz, bicycle ergometer exercise, and their combination. An exposure to acceleration of 3 Gz in a 7.25 m arm centrifuge was used as a provocative test. The above countermeasures reduced but not eliminated entirely immersion-induced cardiovascular deconditioning. A combined use of acceleration of 1 to 2 Gz in a short-arm centrifuge and bicycle ergometer exercise can be recommended as a countermeasure against cardiovascular deconditioning in weightlessness. PHARMACOLOGICAL ANALYSIS OF PHYSIOLOGICAL MECHANISMS OF ORTHOSTATIC HEMODYNAMIC STABILITY c52

L. I. Osadchiy *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 69-74 refs Tansl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 45-49 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

In urethane anesthesized cats, securinine brought about a distinct increase in compensatory reactions of arterial pressure and cardiac output during an upright tilt at 45 deg. The experiments also showed a substantial increase in compensatory recovery of the volume velocity of circulation in the posterior vena cava. Myorelaxant induced arrest of contractile function of skeletal muscles prior to securinine administration reversed compensatory reactions of arterial pressure and cardiac output during tilt test. BIOELECTRIC ACTIVITY OF THE HUMAN BRAIN DURING AND AFTER 182-DAY ANITORTHOSATIC HYPOKINESIA c52

T. N. Krupina, Kh. Kh. Yarullin, and D. A. Alekseyev *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 75-83 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 49-54 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

Cerebral bioelectric activity of 18 healthy test subjects, aged 31 to 40, was examined during and after their 182 day head-down tilting. The test subjects were divided into a group that performed countermeasures (exercise, muscle stimulation) against hypokinesia-induced disorders and a control group. During

the study EEG changes were most pronounced in the controls: alpha-rhythm amplitude, frequency, and index decreased; slow wave frequency reduced; index of zonal differences and amplitude beta and slow waves increased. Phasic changes in the central nervous system excitability in response to a flickering light of 8 to 25 cps were found. Typical changes in spontaneous EEG during a 3 min pulmonary hyperventilation test were enhanced. The study gives evidence that the dynamics of spontaneous EEG as well as cerebral bioelectric activity in response to flickering light and pulmonary hyperventilation are important indicators of the cerebral function, especially of the cortical activity decrease.

MORPHOMETRIC ANALYSIS OF GLOMERULES AND JUXTAGLOMERULA SYSTEM OF THE RAT KIDNEY IN THE COURSE OF EXPERIMENTAL HYPOKINESIA **c52**
I. P. Chernov and A. G. Gafarov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 84-89 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2 Mar./Apr. 1980 p 54-47 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

A certain correlation between variations in the means of the volume of cortical and juxtamedullary glomerules and the function of the juxtaglomerular apparatus was established. It is hypothesized that at early hypokinesia renal vascular changes are nonspecific. The phenomenon of renal excretion of fluids and electrolytes is explained in terms of a simultaneous increase in the reninangiotensin activity and 11-hydroxycorticosteroid content in plasma.

EFFECT OF HYPOKINESIA ON CHANGES IN CARBOHYDRATE AND LIPID METABOLISM IN THE HEART AND LIVER **c52**
Yu. P. Rylnikov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 90-96 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2 Mar./Apr. 1980 p 57-62 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

The rate of assimilation of carbohydrates via glycolysis and the pentose-phosphate pathway, as well as changes in B bile in hypokinetic rabbits were studied. Results indicate that rigid immobilization of rabbits is accompanied by a reduction of glycolysis rate in the liver and, particularly, in the heart, and a simultaneous increase of the fraction of carbohydrate utilization in the pentose phosphate pathway. It is also followed by cholesterol accumulation in the blood and tissues in spite of an accelerated bile excretion of cholesterol and its derivatives, biles acids.

THE QUESTION OF USING DEHYDRATED FOODS DURING LONG-TERM SPACE FLIGHTS **c54**
V. P. Bychkov and M. V. Markaryan *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 103-108 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 66-70 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

The results of five studies on 35 test subjects conducted to test diets of dehydrated products to be used in prolonged space flights are discussed. It is demonstrated that a diet consisting of only dehydrated food products can be used for a prolonged time (up to 1 year). Dehydrated foods after a 2 year storage and proton irradiation at a dose of 24,000 rad retain their biological value and assure and adequate nutritional status. On this basis a space diet composed of dehydrated foods developed.

SYSTEM OF HYGIENIC INSPECTION OF NONMETAL MATERIALS USED IN SPACECRAFT EQUIPMENT **c27**
G. I. Solomin *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 110-115 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2 Mar./Apr. 1980 p 70-74 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

In view of a wide use of polymers in the spacecraft interior and their potential harzard, a system of hygienic control over their safety at every manufacture stage was introduced. The system includes: an analysis of a list of polymers; laboratory testing of samples under standard conditions; bench testing of various polymers used in the hardware and software under operational conditions; and examination of space cabin environments in real flights. The system of hygienic control allows selection of the safest polymers, i.e., those with minimum outgassing.

STUDY OF COMPATIBILITY OF CERTAIN HIGHER PLANTS AND CHLORELLA AS RELATED TO A BIOREGENERATIVE HUMAN LIFE SUPPORT SYSTEM **c54**
Yu. I. Shaydorov, B. N. Shebalin, and G. I. Mateshko *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14, No. 2, 1980 (JPRS-75654) 8 May 1980 p 116-122 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 74-78 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

Mutual effects of Chlorella and higher plants cultivated together in a closed atmosphere are discussed. It can be inferred that gaseous products of Chlorella did not exert a significant effect on the carbon dioxide consumption by wheat and radish plants or on their biomass increment. In turn, gaseous products of higher plants did not or influence Chlorella growth. It can, therefore, be concluded that Chlorella and the above higher plants, when cultivated in a common atmosphere, do not inhibit each other and can be regarded as biologically compatible constituents of the photoautotrophic component of future bioregenerative life support systems.

USE OF POLYURETHANE FOAM DEFORMATION SENSOR TO RECORD RESPIRATORY ACTIVITY c35
V. I. Bredov and V. S. Baranov *In its* USSR Rept.: Space Biol. and Aerospace Med., Vol. 14 No. 2, 1980 (JPRS-75654) 8 May 1980 p 134-136 refs Transl. into ENGLISH from Kosm. Biol. Aviakosm. Med. (USSR), v. 14, no. 2, Mar./Apr. 1980 p 84-85 (For primary document see N80-28015 18-51)
Avail: NTIS HC A08/MF A01

The sensor developed has some substantial advantages over other known types. It is highly sensitive over a wide range of strain loads. The level of the output signal is linearly related to the force exerted on it, and it is sufficient for direct recording without using amplifiers of electric signals. The sensor is based on elastic, spongy material, polyurethane foam (porolon) with current-conducting material on the pore surface, current-conducting carbon black or electrode paste. The elastic properties of the sensor are built in the actual base of the strain-sensitive element, which simplifies the construction substantially and increases the reliability of the unit. In order to test the possibility of using this sensor to examine respiratory function, human pneumograms were recorded with the subject in a calm state along with the respiratory activity of experimental animals (dogs). Samples of the respiratory curve are shown. The simplicity of design of the sensor makes it possible to use it in various physiological experiments. J.M.S.

NONLINEARITIES IN AUDITORY-NERVE FIBER RESPONSES TO BANDLIMITED NOISE: AN EXPERIMENTAL STUDY AND A MODEL Ph.D. Thesis
Thomas Barton Schalk 1980 222 p
Avail: Univ. Microfilms Order No. 8014270

Discharge rate was measured as a function of spectral level for noise bursts of one bandwidth and center frequency. Such rate-level functions were measured for a number of bandwidths; either the low or high cutoff frequencies were set at fiber characteristic frequency (CF). Rate-level functions were also measured, simultaneously, for single tones at CF. Dynamic range is defined as the range, in dB, over which rate increases from 10 percent to 80 percent of the maximum driven rate to CF tones. When pooling data across CF in single cats, dynamic range is an increasing function of fiber threshold for CF tones and noise stimuli. Narrow bands of noise produce rate-level functions that are similar to those for CF tones. For noise bands centered above CF, rate-level functions became less steep as bandwidth is increased, and are always monotonic. For wide bands of noise centered below CF, rate-level functions can be nonmonotonic or appear to plateau at rates less than the saturation rate to CF tones. Thus, wide bands of noise centered above or below CF can produce lower discharge rates than do narrowbands at the same spectral level. Dissert. Abstr.

MEASUREMENT OF LUNG FUNCTION USING MAGNETOMETERS. 1: PRINCIPLES AND MATHEMATICAL MODELING Progress Report
Donald L. Vawter Nov. 1979 54 p refs
(AD-A083910; MNRI-79-78; Rept-2) Avail: NTIS HC A04/MF A01 CSCL 06/16

The use of magnetometer systems to predict pulmonary air volumes was studied. The sensitivity of the system to angular rotations was found to be small because magnetometers are normally mounted to the subject. Seven mathematical models for predicing volume were investigated, with the finding that two parameter models are adequate for quiet breathing. For complicated maneuvers, a three-parameter model is necessary, and for predictive usefulness, the model must be calibrated using a complex maneuver. Results of studies of the dimensional changes, and the correlation between the dimensional changes, that occur during normal breathing are presented. Author

EFFECT OF HYPOKINESIA ON INVERTASE ACTIVITY OF THE MUCOSA OF THE SMALL INTESTINE
A. Abdusattarov Jun. 1980 5 p refs Transl. into ENGLISH from Uzb. Biol. Zh. (USSR), no. 1, 1978 p 61-62 Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prepared by Academy of Sciences (USSR)
(NASA-TM-76191) Avail: NTIS HC A02/MF A01 CSCL 06P

The effect of prolonged hypokinesia on the enzyme activity of the middle portion of the small intestine was investigated. Eighty-four mongrel white male rats weighing 170-180 g were divided into two equal groups. The experimental group were maintained in single cages under 30 days of hypokinetic conditions and the control animals were maintained under ordinary laboratory conditions. It is concluded that rates of invertase formation and its inclusion in the composition of the cellular membrane, if judged by the enzyme activity studied in sections of the small intestine, are subject to phase changes in the course of prolonged hypokinesia. Tests were performed with 70 rats to determine the effects of restraint on the functions and structure of the myocardium under varying conditions of adrenal imbalance. Results showed that in rats with adrenal imbalance, fasting and restraint produced the same biochemical alterations as in the controls. The morphologic alteractions, as well as their electric expression, were more varied and evident in the animals with adrenal imbalance. Persistence of the microscopic and electrocardiographic alterations after 72 hours restraint in the animals subjected to unilateral adrenalectomy suggests chronic evolution of the myocardial lesions. This proves the necessity of intact adrenals for a good adaptability to stress. L.F.M.

Prolonged hypokinesis (100-170 days) studied in 2000 rats kept in cages limiting their mobility provoked considerable changes in the gaseous and energetic metabolism: an elevation of the total gaseous metabolism and of the rate of O2 requirement by the muscles (in the late periods of hypokinesis) and a change in the intensity of tissue respiration of the liver and myocardium. There also proved to be a reduction in the level of phosphorylation and separation of oxidative phosphorylation in the myocardium, liver, and partially in the skeletal muscle. Prolonged hypokinesia led to changes in tissue metabolism: a disturbance of development of the animals, a marked delay and an increase in the weight of the organism and the muscular system, and disturbances of the mineral and protein metabolism. Prolonged hypokinesis also lead to exhaustion of the hypothalamus-hypophysis-adrenal cortex system. R.E.S.

(Contract NASw-3199)
(NASA-TM-75796) Avail: NTIS HC A03/MF A01 CSCL 06S

A group of 12 highly trained athletes and a group of 12 untrained students were subjected to passive changes of position on a tilt table and positive accelerations in a centrifuge. During a 20 min tilt, including two additional respiratory maneuvers, the number of faints and average cardiovascular responses did not differ significantly between the groups. During linear increase of acceleration, the average blackout level was almost identical in both groups. Statistically significant coefficients of product-moment correlation for various relations were obtained. The coefficient of multiple determination computed for the dependence of acceleration tolerance on heart-eye distance and systolic blood pressure at rest allows the explanation of almost 50% of the variation of acceleration tolerance. The maximum oxygen uptake showed the expected significant correlation to the heart rate at rest, but not the acceleration tolerance, or to the cardiovascular responses to tilting. L.F.M.

THE CONTENT OF CATECHOLAMINES IN THE ADRENAL GLANDS AND SECTIONS OF THE BRAIN UNDER HYPOKINESIA AND INJECTION OF SOME NEUROTROPIC AGENTS
B. E. Melnik and E. S. Paladiy. Mar. 1980. 10 p. refs. Transl. into ENGLISH from Biol. Nauki (USSR), v. 15, no. 11, 1972 p 45-49. Transl. by Kanner (Leo) Associates, Redwood City, Calif. Original doc. prep. by V. I. Lenin Kishinev State Univ. USSR
(Contract NASw-3199)
(NASA-TM-76010) Avail: NTIS HC A02/MF A01 CSCL 06S

The dynamics of catecholamine content were studied in the adrenal glands and in various region of the brain of white rats under hypokinesia and injections of neurotropic agents. Profound changes in body catecholamine balance occured as a result of prolonged acute restriction of motor activity. Adrenalin retention increased and noradrenanalin retention decreased in the adrenal glands, hypothalamus, cerebral hemispheres, cerebellum and medulla oblongata. Observed alterations in catecholamine retention varied depending upon the type of neurotropic substance utilized. Mellipramine increased catecholamine retention in the tissues under observation while spasmolytin brought about an increase in adrenalin concentration in the adrenals and a decrease in the brain. CARDIOVASCULAR AND RESPIRATORY PHYSIOPATHOLOGICAL ASPECTS OF HYPOKINESIA
A. Dagianti. Jun. 1980. 26 p. refs. Transl. into ENGLISH from Recenti Progr. Med. (Italy), v. 52, no. 4, 1972. p. 323-344. Transl. by Scientific Translation Service, Santa Barbara, Calif. (Contract NASw-3198)
(NASA-TM-76198) Avail: NTIS HC A03/MF A01 CSCL 06S

The many effects of hypokinesia on the human organism are described. The differences in normally mobile subjects and hypokinetic subjects as relates to heart rate, average humeral pressure, cardiac capacity, cardia index, systolic range, and large cycle resistances are discussed. It is concluded that further studies must be carried out in seven specific areas of cardiocirculatory damage due to hypokinesia. R.E.S.

EFFECTS OF OZONE ON EXERCISING AND SEDENTARY ADULT MEN AND WOMEN REPRESENTATIVE OF THE FLIGHT ATTENDANT POPULATION
E. A. Higgins, M. T. Lategola, J. M. McKenzie, C. E. Melton, and J. A. Vaughan. Oct. 1979. 106 p. refs.
(AD-A080045; FAA-AM-79-20) Avail: NTIS HC A06/MF A01 CSCL 06/16

Three studies at two ozone concentrations have been carried out in an attempt to define the effect level for ozone under simulated flight conditions. All experiments were carried out in an altitude chamber held at 6,000 feet MSL; relative humidity was kept at 10-12 percent and temperature at 68 - 74 F. Subjects paid were nonsmoking men and women in their third decade who had the anthropomorphic characteristics of airline flight attendants. All subjects were exposed to ozone in one experiment and to air only in another. Order of presentation of the experiments was balanced, and sessions were separated by 1 week. Study 1 consisted of exposure of 15 men and 12 women to 0.20 parts per million by volume (ppmv) ozone for 4 h with treadmill exercise for the last 10 min of each hour. In the second study 14 men and 14 women were exposed to 0.30 ppmv ozone for 3 h with 10 min exercise at the end of each hour. The third study consisted of exposure of 14 men and 14 women to 0.30 ppmv without exercise. Cardiopulmonary, performance, visual, and symptoms assessments were made. GRA

RESPONSE TIME, OPERATOR PRODUCTIVITY AND JOB SATISFACTION Ph.D. Thesis
Raymond Earle Barber 1979 117 p
Avail: Univ. Microfilms Order No. 8014200

The impact is examined of on-line system response time on operator productivity and job satisfaction. A user organization in Cincinnati, Ohio and its five on-line systems provided the environment for the study. The impact of response time on productivity suggests that all or nearly all (e.g., 98%) transactions should be completed in 12 seconds or less. Beyond this level, the user organization suffers severe penalties in lost productivity. When response times are less than six seconds, productivity is relatively flat. That is, the impact of response time on productivity is not as great when average response time is less than six seconds as it is when average response time is greater than six seconds. It is concluded that the normal operating range of the systems studied should be in the four to six second range. It was predicted, prior to the study, that all categories of job satisfaction would be adversely affected by longer response times. The results, however, indicate that response time has a mixed impact on job satisfaction. Some categories showed decreased satisfaction as predicted. Others, however, demonstrated an improvement in job satisfaction as response time increased. These were mainly categories dealing with interpersonal relationships. Based upon the results the implications of response time on system operation and system design are discussed. A method is suggested that would allow the response time models to be applied to other online systems. Desirable directions for future research are discussed in depth. Dissert. Abstr.

A CONCEPT FOR DEVELOPING HUMAN PERFORMANCE SPECIFICATIONS Final Report
Jonathan D. Kaplan and William H. Crooks Aberdeen Proving Ground, Md. Human Eng. Labs. Apr. 1980 47 p refs (Contract DAAK11-79-C-0115)
(AD-A084617; PTR-2020-80-3; HEL-TM-7-80) Avail: NTIS HC A03/MF A01 CSCL 15/5

OMB Circular A-109 emphasizes the front end of systems acquisition with the intent of (1) expressing needs and program objectives in 'mission' terms rather than 'equipment' terms, and (2) allowing competitive exploration of alternative methods of meeting those needs. For human factors specialists to comply with these requirements, it will be necessary for them to produce explicit specifications for the critical human performance which is required for system performance. This paper presents a concept for producing these required human performance specifications prior to the initial design of a system. It also presents an example of a detailed human performance specification as well as Appendices containing material used to produce human performance specifications for various kinds of systems. GRA

A MATHEMATICAL MODEL FOR USE IN EVALUATING AND DEVELOPING IMPACT TEST METHODS FOR PROTECTIVE HEADGEAR
Robert E. Berger Oct. 1979 79 p
(PB80-164957; NBSIR-80-1987) Avail: NTIS HC A05/MF A01 CSCL 06Q

A lumped parameter mathematical model was developed to connect injury parameters in real life head impact environments to output parameters of test methods for evaluating protective headgear. Analytical/experimental schemes were developed for

mathematically representing the parameters that characterize each of the three distinct elements of the model: the head or headform; the impact surface; and the helmet. The model was shown to be useful in determining test method pass/fail criteria which corresponds to the threshold of injury in the real life situation. GRA

APPROACH TO SOUNDING ON THE VAS PROCESSOR
Dennis Chesters Mar. 1980 23 p refs
(NASA-TM-80713) Avail: NTIS HC A02/MF A01 CSCL 09B

The key features of the sounding software laboratory being installed on the VAS Processor at NASA/GSFC are outlined. Emphasis is on the support data and personal guidance that a meteorological researcher must provide to attune a physically modeled VAS sounding to his experiment. The fundamental aim of the sounding-support effort is to provide a system which makes use of: radiation transfer models based upon laboratory data, analytic inversion schemes, human guidnace for quality control, statistically conditioned retrieval methods, and current ancillary data. SPATIAL DATA MANAGEMENT SYSTEM Quarterly Research and Development Technical Report, 1 Sep. - 30 Nov. 1979
David Kramlich, Christopher F. Herot, Richard Carling, and Mark Friedell 30 Nov. 1979 38 p refs
(Contract MDA903-78-C-0122; APRA Order 3487)
(AD-A083729) Avail: NTIS HC A03/MF A01 CSCL 09/2

Work on the design and implementation of a prototype Spatial Data Management System (SDMS) is described. Spatial Data Management is a technique for storing and retrieving information which employs pictorial representations of data arranged on a collection of flat surfaces which the user can view on a color, raster scan display. Tools are provided for interactively entering graphical and symbolic data, including a mechanism for generating graphical representations of existing, shared symbolic data bases. Several new features that increase the utility of the system were implemented. These are: a new statement in the modified query language of the underlying DBMS; extensions to the graphical editor; extensions to the module which manages objects in the graphical Data Space (GDS); and a terminal emulator to provide a text interface to SDMS. PERFORMANCE PREDICTION FROM A COMPUTER HARDWARE DESCRIPTION
Lyle Ashton Cox, Jr. Dec. 1979 25 p refs
(RR0000110)
(AD-A083842; NPS52-79-001) Avail: NTIS HC A02/MF A01 CSCL 09/2

Today's computers are among the most complex man made systems in existence today. How can we make our designs not only more precise, but make these systems more accurately and cost effectively achieve their goals? We have begun to rely upon computer aided design techniques. The use of these techniques often commences not with the statement of the system goals, but rather with the specification of an architecture and a logic technology. In view of the high costs of computer development, we should be quite confident that our architecture/technology combination is capable of meeting the system requirements before we proceed to more detailed design phases. The entire system design process must be integrated, and include performance prediction and verification techniques. This design process should be reflected in a single description language. A methodology for accomplishing this goal capable of employing many existing design practices is discussed here. GRA

FORMAL TECHNIQUES FOR FAULT-TOLERANCE IN DISTRIBUTED DATA PROCESSING (DDP) Final Report
Jack Goldberg, William H. Kautz, Leslie Lamport, Peter G. Neumann, Robert E. Shostak, and Marshal C. Pease 1 May

1980 70 p refs
(Contract DASG60-78-C-0046; SRI Proj. 7242)
(AD-A084537) Avail: NTIS HC A04/MF A01 CSCL 09/2

Previous work on the logical specification of distributed systems has been continued. The basic approach involves specifying the logical functioning of the system in terms of an abstract state machine. Part of the fault-tolerance of the system is achieved by the reliability of this state machine. However, the problem of faulty inputs must be explicitly handled by the state machine. A fault-tolerant DDP system must handle malfunctioning components that give conflicting information to different parts of the system. This problem is expressed abstractly as the 'Byzantine Generals Problem', involving a group of generals communicating by messenger who must reach agreement upon a common battle plan despite the fact that one or more of them may be traitors trying to confuse the others. Several solutions are described and their use in implementing fault-tolerant DDP systems is discussed. Achieving fault-tolerance requires the detection and diagnosis of faults. Our work on the diagnosis of faulty nodes and communication links in a DDP system is described. In the event of a failure, one would like a DDP system to recover rapidly with a minimal loss of information. The value of a hierarchical design methodology in achieving a recovery capability is discussed. GRA

DISTRIBUTED SENSOR SYSTEMS AND ELECTROMECHANICAL ANALOG FACILITY Final Report
Richard A. Volz, S. L. Bement, Richard Jungclas, T. Rosenbaum, E. J. Sesek, J. Wenstrand, S. Cagliastro, A. Zemon, and P. Beck (ARADCOM, Dover, N.J.) Jan. 1980 500 p refs
(Contract DAAG29-76-D-0100)
(AD-A084656; AD-E400397; ARPAD-CR-80001) Avail: NTIS HC A21/MF A01 CSCL 09/2

Distributed sensor systems are key ingredients in many real world applications. Specific instances abound both in industrial and military environments, e.g., the monitoring (and possibly control) of manufacturing operations, or the dispersion of various types of sensors to detect enemy movements. There are two major areas of study in distributed sensors: the design and development of the sensors themselves, and the logical use of such sensors. This report is directed toward mechanisms to study the latter. Some examples of the latter, explained in detail, are based on CICE/ECE/IOE 469, a course in Real Time Computing Systems developed at the University of Michigan, Ann Arbor. Both student and faculty critiques of the electromechanical analog facility used in the program are included. GRA

COMPUTER SCIENCE AND TECHNOLOGY: VALIDATION VERIFICATION, AND TESTING FOR THE INDIVIDUAL PROGRAMMER Final Report
Martha A. Branstad, John C. Cherniavsky, and W. Richards Adrion Feb. 1980 31 p refs
(PB80-166960; NBS-SP-500-56; LC-80-600005) Avail: NTIS HC A03/MF A01 CSCL 09B

Guidelines are given for program testing and verification to insure quality software for the programmer working alone in a computing environment with limited resources. The emphasis is on verification as an integral part of the software development. Guidance includes developing and planning testing as well as the application of other verification techniques at each lifecycle stage. Relying upon neither automated tools nor formal quality assurance support, the guidelines should be appropriate for applications programmers doing small development projects. GRA

OPTIMIZATIONS OF STOCHASTIC SYSTEMS THROUGH SIMULATION USING STOCHASTIC APPROXIMATION METHOD Ph.D. Thesis
Farhad Azadivar 1979 170 p
Avail: Univ. Microfilms Order No. 8015423

An algorithm was developed for optimizing the response function of simulation models with stochastic behavior. Principles of stochastic approximation were used in developing this algorithm which guaranteed convergence to the optimum, if large number of observations were made. The algorithm yielded accurate answers even when the number of observations were not too large. The algorithm is further developed to optimize such simulation models even when the decision variables were subject to a set of linear constraints. Dissert. Abstr.

N80-28063 Kansas State Univ., Manhattan.
A STUDY OF THE SEQUENTIAL REGRESSION (SER) ALGORITHM AND ITS APPLICATIONS
David Lynn Soldan 1979 160 p
Avail: Univ. Microfilms Order No. 8015280

The sequential regression (SER) algorithm which enables a direct adaptive implementation of the least squares optimum filter is discussed. It has superior convergence characteristics when compared to other algorithms. Since the SER algorithm computes the inverse of the autocorrelation matrix of the input data, problems can arise if a unique inverse does not exist. A modification is given that guarantees a unique solution thus enabling the SER algorithm to be used for all input signals. Factors that effect the performance of an adaptive filter implementing the SER algorithm when it is in a long-term signal processing environment are also considered. An additional modification is presented to obtain the performance necessary for long-term signal processing. The results revolving the SER algorithm for phase compensation are given. These clearly demonstrate that the performance of the SER algorithm is superior to existing algorithms used for this purpose. Dissert. Abstr.

TREATMENT OF UNGRAMMATICAL AND EXTRAGRAMMATICAL PHENOMENA IN NATURAL LANGUAGE UNDERSTANDING SYSTEMS Ph.D. Thesis
Stan C. Kwasny 1980 148 p
Avail: Univ. Microfilms Order No. 8015897

Several language phenomena commonly considered deviant by linguistic standards, and how they might be integrated into a computer model for understanding Natural Language were investigated. Techniques developed within the Augmented Transition Network (ATN) model are shown to be adequate to relate many of these cases to well-formed counterparts. First, linguistic problems are defined and discussed and then techniques for overcoming these problems are presented. The techniques require a normative grammar be given which specifies the processing required of grammatical inputs. Our mechanisms work to relate ungrammatical inputs to appropriate grammatical ones and to process them accordingly. The mechanisms proposed include two techniques for relaxing restrictions in the grammar, a new arc type employing pattern matching, and a method for dynamically ordering the evaluation of arcs. The efficiency and structural characteristics of the original normative grammar are not altered by these mechanisms. Dissert. Abstr.

N80-28065 California Inst. of Tech., Pasadena.
A SOFTWARE DESIGN SYSTEM Ph.D. Thesis
Gideon David Hess 1980 193 p
Avail: Univ. Microfilms Order No. 8016367

The goal of the research was to build a system that supports, without interfering with, the activity of systematic software design and takes upon itself mechanical activities the designer can be spared. Two of the main activities which constitute the process of software creation are: (1) designing a solution to the problem; (2) implementing the design. The activity of design has to be performed by the programmer himself, it can only be aided by the computer. Producing a program from a complete design is a mechanical activity the computer can take upon itself. These observations lead to the following objectives that a software design system should meet: (1) Providing tools that support the design activity and enable maximum flexibility; (2) Recognizing the lowest level primitives of the design as the target language and producing the program in this language. A system along

these guidelines was implemented. It permits the user to write definitions which refine high level design decisions into lower levels and, at the same time, serve as syntax descriptions and translation rules for the languages used in the design.
Dissert. Abstr.

N80-28066 Rochester Univ., N. Y.
PROGRAM CHECKING Ph.D. Thesis
Graeme John Williams 1980 130 p
Avail: Univ. Microfilms Order No. 8014345

A set of language features for declaring properties of variables. The scheme allows for richer descriptions of variables than simple data types is more expressive than the type mechanism in other languages, and can be checked efficiently. Properties differ from types in that a variable may have more than one property, and the matching of the actual argument of a procedure call to the formal in the definition is by implication. There are two kinds of properties: interpreted and uninterpreted. Interpreted properties depend only on the value of a variable, for example positive or odd. They can be defined with a built-in unary relation and a variable, such as odd(x), or with a binary relation, a variable and a constant, such as $y > 0$. They are a natural extension of subrange types. Uninterpreted properties provide implicit information about the domain of a variable. For example one variable might be a number of apples, another a number of organges. Uninterpreted properties allow each variable to be labelled with the property apples or oranges. A property fruit related to both apples and oranges, may be defined, so that adding apples to oranges makes sense if finding the total number of fruit, but not otherwise.

THE APPLICATION OF REGRESSION METHODS TO THE INITIAL TRANSIENT PROBLEM IN COMPUTER SIMULATIONS Ph.D. Thesis
Mark Kamerer Snell 1980 178 p
Avail: Univ. Microfilms Order No. 8015742

Regression methods were developed for inferring first order stationary behavior of simulated systems. The multivariate response sampled during a simulation experiment was regarded as a stationary stochastic process contaminated by an additive stochastic transient process. The transient process was introduced when initial conditions for the runs in the experiment were selected. Parameters of an underlying stationary model were estimated when the transient contamination was present. Both point and interval estimators were considered. The procedure, under stipulated conditions, lead to estimators that were consistent, efficient and converge in law to a multivariate normal distribution. Two general growth models were proposed for the transient process. These regressors were used to improve short run length bias due to initialization. The consequences of misspecification of the transient model were studied.

A COMPUTER GRAPHICS SYSTEM FOR MACROMOLECULAR MODEL BUILDING Ph.D. Thesis
James Ross Miller 1979 243 p
Avail: Univ. Microfilms Order No. 8015492

A design system was developed which automatically segments and pages the electron density map data and allows users to build molecular models into this map a single residue at a time. All communications between the user and the system was in the language of the model builder. The system was tested by constructing a model of southern bean mosaic virus (SBMV) into a 2.8 angstrom resolution electron density map. With a few exceptions the resultant molecular coordinates were found to be in close agreement with those obtained from building a physical model of SBMV into the same map, and the time required to build the model on the graphics system was much less than that required for the physical model.

PROBABILITY TRANSFORMS OF DIGITAL PICTURES
Ann Scher and Azriel Rosenfeld Apr. 1979 24 p refs
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084286; TR-758) Avail: NTIS HC A02/MF A01 CSCL 09/2

Let g be any local property (e.g., gray level or gradient magnitude) defined on a digital picture. Let pg(z) be the relative frequency with which g has value z. At each point (x,y) of the picture we can display pg(g(x,y)), appropriately scaled; the result is called the pg-transform of the picture. Alternatively, we can use joint or conditional frequencies of pairs of local properties to define transforms. This note gives examples of such transforms for various g's and h's and discusses their possible uses and limitations.

A PATH-LENGTH DISTANCE TRANSFORM FOR QUADTREES
Michael Shneier Jul. 1979 41 p refs
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084293; TR-794) Avail: NTIS HC A03/MF A01 CSCL 05/8

The size of a region in an image and distances between subregions of an image are useful geometric properties for describing region shape. In particular, the distance of interior points from the border is a useful measure for operations such as thinning and finding skeletons of regions. Most algorithms for finding the distance from a point inside a region to the border have involved multiple passes over the data, each pass incrementing a local counter denoting the distance of the associated point in the image. This paper presents an algorithm that computes the distance function in a single pass over an image represented by a quadtree. A distance measure is defined for a quadtree representation of a binary image. An algorithm is presented that calculates the distance from the center of each BLACK node to the border of the nearest WHITE node. The distance is defined as the path length from the center of the BLACK node, through the center of intervening BLACK nodes, to the WHITE border. The worst case average execution time is shown to be proportional to the product of the log of the image diameter and the number c^d blocks in the image.

INTERACTIVE NONLINEAR STRUCTURAL ANALYSIS. A REVIEW OF THE GIFTS-STAGS UNION Final Report
31 Mar. 1980 24 p refs

(Contract N00014-79-C-0070)
(AD-A084209; LMSC-D686137) Avail: NTIS HC A02/MF A01 CSCL 09/2

The three primary tasks were: (1) the GIFTS and STAGS finite element programs were to be data-base linked permitting GIFTS graphics-interactive pre- and post-processing of STAGS batch nonlinear structural analysis; (2) interactive software was to be introduced to facilitate convenient operation of the software assembly; and (3) the resulting integrated system was to be verified and documented. The corresponding results: (1) It is now possible to utilize GIFTS pre-and post-processing for a limited variety of STAGS analyses; (2) the software assembly is accessible to the user within a totally conversational environment in which both batch and interactive phases of analysis are prepared, managed and data-base monitored; and (3) current capabilities have been verified with respect to a modest selection of sample problems. THE ELECTRIC SIMULATOR PROGRAM (ESP) USAGE GUIDE Interim Report, 1 Jul. 1975 - 1 Dec. 1979
Emmagene R. Coffey and Harvey J. Wertz 1 May 1980 203 p refs
(Contract F04701-79-C-0080)
(AD-A084676; TR-0080(9320)-1; SD-TR-80-21) Avail: NTIS HC A10/MF A01 CSCL 09/2

The Eclectic Simulator Program (ESP) is a system (a precompiler plus a collection of subroutines) that permits the fast, easy solution of ordinary differential equations. Any user with a general knowledge of FORTRAN can utilize ESP's many labor saving devices to code a problem with minimal effort. Special ESP features permit translation of engineering blocks, discontinuities, and hysteresis patterns directly into computer code, and the use of WHELP in conjunction with ESP facilitates efficient coding of matrix algebra equations. Simple input cards enable the user to directly control solution and timing accuracy and to specify or change run times, initial conditions, and various other parameters easily when making multiple or stacked runs. Finally, ESP allows the user to select from a wide variety of output options. This manual is intended to be both a learning tool for the novice and a detailed reference for the experienced user. GRA

COMPLEXITY AND COMPUTABILITY OF SOLUTIONS TO LINEAR PROGRAMMING SYSTEMS
A. Charnes, W. W. Cooper (Harvard Univ., Cambridge, Mass.), S. Duffuaa, and M. Kress Feb. 1980 39 p refs
(Contracts N00014-75-C-0569; N00014-80-C-0242; NR Proj. 047-071; NR Proj. 047-021)
(AD-A084682; CCS-367) Avail: NTIS HC A03/MF A01 CSCL 09/2

Complexity, computability and solution of linear programming systems are re-examined in the light of Khachian's new notion of (approximate) solution. Algorithms, basic theorems and alternate representations are reviewed. It is shown that the Klee-Minty example has never been exponential for (exact) adjacent extreme point algorithms and that the Balinski-Gomory (exact) algorithm is polynomial where (approximate) ellipsoidal 'center-cut-off' algorithms (Levin, Shor, Khachian, Gacs-Lovasz) are exponential. Both the Klee-Minty and the new J. Clausen example are shown to be trivial (explicitly solvable) interval programming problems. A new notion of computable (approximate) solution is proposed together with an a priori regularization for linear programming systems. New polyhedral 'constraint contraction' algorithms are proposed for approximate solution and the relevance of interval programming for good starts or exact solution is brought forth. GRA

PERFORMANCE RIPPLE EFFECT ANALYSIS FOR LARGE-SCALE SOFTWARE MAINTENANCE Interim Report, Nov. 1977 - Nov. 1979
Stephen S. Yau and James S. Collofiello Griffiss AFB, N.Y. RADC Mar. 1980 125 p refs
(Contract F30602-76-C-0397; AF Proj. 5581)
(AD-A084351; RADC-TR-80-55) Avail: NTIS HC A06/MF A01 CSCL 09/2

This report analyzes the possible ripple effect of software modifications during the maintenance phase on the performance of the system, and leads to the development of a maintenance technique for predicting which performance requirements in the system may be affected by a proposed modification. This report formalizes the technique outlined in our previous report entitled, Performance Considerations in the Maintenance Phase of Large-Scale Software Systems. This technique enables maintenance personnel to incorporate performance considerations in their criteria for selecting the types and locations of software modifications to be made. After the maintenance changes have been implemented, this technique can also be useful to the retesting effort of the system by identifying which performance requirements must be reverified to insure that they have not been violated by the maintenance activity. This technique is applicable to all types of large-scale software systems possessing performance requirements, including multiprocessing systems. In the development of this technique, mechanisms for the propagation of performance changes from one part of the system to another are identified. Performance attributes and critical software sections are also identified. GRA

EVALUATION OF PROJECTION ALGORITHMS
Guatum Biswas, Anil K. Jain, and Richard Dubes Sep. 1979 55 p refs
(Grant NSF ENG-76-11936)
(PB80-163702) Avail: NTIS HC A04/MF A01 CSCL 09B

Several linear and nonlinear mapping algorithms for the projection of patterns from a high dimensional space to two dimensions are studied. These two dimensional representations allow a quick visual observation of the data set under consideration. A combination of two popular mapping algorithms - Sammon's mean square error technique and the Triangulation method - is proposed to overcome the limitations in the individual algorithms. Some factors which described the goodness of a projection are described, and a comparison is made of six of these algorithms by running them on four data sets. The results obtained are calculated and their significance is discussed. GRA

USING ANS FORTRAN Final Report
Gordon Lyon, ed., Frances E. Holberton, J. Larmouth (Salford Univ., England), and M. D. McIlroy (Bell Telephone Labs., Inc., Murray Hill, N.J.) Mar. 1980 109 p refs
(Grant NSF DCR-75-045443)
(PB80-168545; LC-80-600009) Avail: NTIS HC A06/MF A01 CSCL 09B

This FORTRAN volume presents, in order: a set of quick and clear reference charts for ANS FORTRAN 66 syntax; observations on using only standard FORTRAN 66 featurs; instructions on circumventing and extending FORTRAN 66 with the least harm; an appraisal of the new FORTRAN 77 in terms of FORTRAN 66 constructs. Although the chapters comprise much material that has appeared in other technical memoranda or published articles, heavily recast sections have been re-referenced. The four chapters address programmers concerned with FORTRAN transportability, managers engaged in programming standards, and other practitioners interested in system influences upon languages. Since the text touches upon several general programming aspects (input/out, storage allocation, storage lifetime and protection, control structures), the volume's appeal will extend beyond the immediate FORTRAN community. COMPUTER NETWORKS: A MARTINGALE APPROACH Ph.D. Thesis
Jean Camille Walrand 1979 94 p
Avail: Univ. Microfilms Order No. 8014920

The results presented concern networks of queues which can be modelled as a continuous time Markov chain. An abstract model is developed and used to derive the filtering equations satisfied by the conditional probability distribution of the state of the network given the past of an observed set of flows. This approach yields a simple proof of the loop criterion for single class Jacksonian networks. A probabilistic interpretation of a necessary condition for a given flow in a multi-class Jacksonian network in equilibrium to be Poisson is also derived and used to show that the loop criterion does not apply to those networks. The properties of interconnected Markov chains are discussed and applied to mixed networks built from quasi-reversible nodes. It is shown that the quasi-reversibility and the product form for mixed networks follow from the results for open networks. The transit time of a customer on a path of a multiclass Jacksonian network is analysed. It is proved that if a path permits no overtaking, then the sojourn times of a customer in the nodes of that path are mutually independent and have the same distribution as in a single M/M/1 queue with same expected input rate. Examples show that the no overtaking condition cannot be relaxed in general. Dissert. Abstr.

THE INDEPENDENCE OF CONTROL STRUCTURES IN ABSTRACT PROGRAMMING SYSTEMS Ph.D. Thesis
Gregory Anthony Riccardi 1980 157 p
Avail: Univ. Microfilms Order No. 8016240

An instance of a control structure is a mapping which takes one or more programs into a new program whose behavior is based on that of the original programs. An instance of a control structure is effective if it is effectively computable. In order to study the interrelationships of control structures, abstract programming systems (numberings of the partial recursive functions) are considered, in which some control structures, effective or otherwise, are present, but others are not. The techniques of recursive function theory, including recursion theorems, priority arguments, and Blum complexity theory to prove the independence of certain control structures in abstract programming systems are discussed. For example, the following results were obtained. In effective numberings of the partial recursive functions, the one-one effective Kleene recursion theorem and the one-one effective (partial) if-then-else control structure are independent, but together, they yield all effective control structures. In any effective numbering, the effective Kleene form of the double recursion theorem yields all effective control structures. In effective numberings, the effective Rogers' fixed point form of the recursion theorem need not yield the control structure delay, effective or otherwise; hence, it does not yield the Kleene form of the recursion theorem. TIME-VARYING QUEUES REQUIRING SECONDARY SERVICE MECHANISMS FOR PRIMARY SERVERS Ph.D. Thesis
James Joseph Mager 1980 232 p
Avail: Univ. Microfilms Order No. 8015902

These systems involve customers being served by primary servers. However, after an initial service phase, the primary servers may require the use of secondary servers in order to serve the customer. This differs from the general network problem in that the primary server accompanies the customer (or his request) to the second system. The primary servers may have to wait, along with the customer of his request, for a secondary server to be free. A third phase of service may be provided by the primary servers after consultation with secondary servers. Both system A and system B are studied under time-varying arrival and service rates as well as time-varying primary and secondary service conditions. Arrival and service rates are approximated as fitted step functions. This makes these parameters constant over each interval of time. Dissert. Abstr.

APPROXIMATE SOLUTIONS OF QUEUEING NETWORK MODELS OF COMPUTER SYSTEMS Ph.D. Thesis
Gianfranco Balbo 1979 408 p
Avail: Univ. Microfilms Order No. 8015424

Queueing network models of current computing systems are often too complex to satisfy the decomposability conditions which yield exact analytical solutions. Approximation methods for the solution of nondecomposable queueing network models of computer systems are discussed. The objective of these approximation methods is to adjust the parameters of a product form model in search of a best fit to the original system. It was discovered that corresponding to an arbitrary queueing network, there is an equivalent decomposable model whose queue length distributions are identical to those of the original system. This result means that product form based approximation methods

are, in principle, perfectly accurate, i.e., it assures the existence of an equivalent decomposable model sought by these techniques. The equivalence principle produces also a clearer understanding of existing approximation schemes and leads to improvements. Existing approximation methods and their variations are compared using a benchmark of 24 models representing a wide range of behaviors. Patterns of good and poor behavior are revealed for each one of these techniques. Dissert. Abstr.

THE OPTIMIZATION OF QUERY PROCESSING ON DISTRIBUTED DATABASE SYSTEMS Ph.D. Thesis
Alan Raymond Hevner 1979 276 p
Avail: Univ. Microfilms Order No. 8015464

A detailed cost model of distributed query processing is developed and two optimization objectives, response time and total time are defined. The problem of finding a minimal cost processing strategy for any given distributed query is proved to be NP-hard. For a special class of queries, optimization algorithms are presented that derive minimal response time and minimal total time processing strategies. The techniques found in these optimal algorithms are used as a basis to develop effective heuristics that find efficient processing strategies for general queries. The heuristic algorithms, Algorithm GENERAL and Algorithm FAST, compare favorably with other proposed optimization algorithms in terms of complexity and quality of derived processing strategies. To evaluate the performance of distributed query optimization methods in a multiprocessing environment, a hybrid simulation model of a distributed base system is designed. The results of two query studies using the model show the importance of optimizing distributed queries. The relative performance of several proposed optimization algorithms is seen to be similar. Dissert. Abstr.

VARIANCE REDUCTION TECHNIQUES FOR THE SIMULATION OF QUEUEING NETWORKS Ph.D. Thesis
James Reed Wilson 1979 212 p
Avail: Univ. Microfilms Order No. 8015542

The aims of this research are the formulation, implementation, and experimental assessment of procedures for applying selected combinations of a variance reduction technique (VRT) together with a confidence interval estimation technique (CIET) in the simulation of queueing networks. These procedures are designed to improve the efficiency of system performance estimators derived from a simulation experiment by exploiting auxiliary information contained in concomitant variables that are observed during the course of the experiment. For this purpose, a class of standardized service time variates are defined on the work stations of a queueing network. A version of the central limit theorem is established for these standardized variates in the context of a general class of regenerative queueing networks. This result constitutes the foundation for the development of post stratified sampling schemes as well as control variate schemes which are specially adapted to CIETs based on independent replications and on the theory of regenerative stochastic processes. The validation of these four VRT/CIET combinations is performed in an analytically tractable closed Jackson queueing system. The evaluation phase is carried out in three similar systems incorporating real-world features that are difficult or impossible to treat analytically; these features include priority scheduling, open and closed customer classes, general service times, and blocking due to capacity constraints. On the basis of the experimental results, guidelines are formulated for the effective application of the developed procedures in practical queueing simulations. Dissert. Abstr.

ON HOMOGENEITY AND ON-LINE-OFF-LINE BEHAVIOR IN M/G/1 QUEUEING SYSTEMS
Raymond M. Bryant Feb. 1980 42 p refs
(Contract DAAG29-75-C-0024)
(AD-A083827; MRC-TSR-2045) Avail: NTIS HC A03/MF A01 CSCL 09/2

Operational analysis replaces certain classical queueing theory assumptions. We also state dual results for inter-arrival times in G/M/1. Finally, we consider the relationship between the operational quantities S(n) and the mean service time in M/G/1. This relationship is shown to depend on the form of the service time distribution. It follows that using operational analysis to predict the performance of an M/G/1 queueing system will be most successful when the service time is exponential. Simulation evidence is presented which supports this claim. GRA

INVESTIGATION INTO ADAPTIVE CONTROL OF A SLIP-CAST, REACTION-BONDED SILICON-NITRIDE PROCESS VIA ADAPTIVE LEARNING NETWORK MODELING Final Technical Report, 31 Jan. - 30 Sep. 1979
Dixon Cleveland, Peter M. Garafola, Basil A. Decina, and Anthony N. Muccairdi 30 Nov. 1979 97 p refs
(Contract MDA903-79-C-0186; DARPA Order 3799)
(AD-A083730; ADI-REF-542) Avail: NTIS HC A05/MF A01 CSCL 07/1

A program was conducted to model the modulus of rupture (MOR) strength using Adaptive Learning Networks (ALN's) for aircraft engine components produced by a slip-cast, reaction-bonded, silicon-nitride production process. The primary objectives of the work were to identify key process variables and to predict optimum values for those variables as a guide for further experimentation. Nonlinear models have been synthesized that predict MOR with an average error of about 4 ksi over a range from 18.6 to 47.8. The manufacturing and analysis work done to date has demonstrated the feasibility of modeling the slip-cast RBSN process with the Adaptive Learning Network methodology and is viewed as the first iteration in the optimization procedure which is ultimately aimed at finding those manufacturing conditions which will produce the strongest, most consistent material strengths. USING PARALLEL PROCESSING FOR PROBLEM SOLVING
William A. Kornfeld Dec. 1979 49 p refs
(Contract N00014-75-C-0522)
(AD-A084638; AI-M-561) Avail: NTIS HC A03/MF A01 CSCL 09/4

Parallel processing as a conceptual aid in the design of programs for problem solving applications is developed. A

pattern-directed invocation language known as ETHER is introduced. ETHER embodies two notions in language design: activities and viewpoints. Activities are the basic parallel processing primitive. Different goals of the system can be pursued in parallel by placing them in separate activities. Language primitives are provided for manipulating running activities. Viewpoints are a generalization of context mechanisms and serve as a device for representing multiple world models. A number of problem solving schemes are developed making use of viewpoints and activities. It will be demonstrated that many kinds of heuristic search that are commonly implemented using backtracking can be reformulated to use parallel processing with advantage in control over the problem solving behavior. The semantics of ETHER are such that things as deadlock and race conditions that plague many languages for parallel processing cannot occur. The programs presented are quite simple to understand. THE PRIMER VECTOR IN LINEAR, RELATIVE-MOTION EQUATIONS
Jan. 1980 28 p refs
(NASA-TM-81111; JSC-16332) Avail: NTIS
HC A03/MF A01 CSCL 12A

Primer vector theory is used in analyzing a set of linear, relative-motion equations - the Clohessy-Wiltshire equations - to determine the criteria and necessary conditions for an optimal, N-impulse trajectory. Since the state vector for these equations is defined in terms of a linear system of ordinary differential equations, all fundamental relations defining the solution of the state and costate equations, and the necessary conditions for optimality, can be expressed in terms of elementary functions. The analysis develops the analytical criteria for improving a solution by (1) moving any dependent or independent variable in the initial and/or final orbit, and (2) adding intermediate impulses. If these criteria are violated, the theory establishes a sufficient number of analytical equations. The subsequent satisfaction of these equations will result in the optimal position vectors and times of an N-impulse trajectory. The solution is examined for the specific boundary conditions of (1) fixed-end conditions, two-impulse, and time-open transfer; (2) an orbit-to-orbit transfer; and (3) a generalized rendezvous problem. A sequence of rendezvous problems is solved to illustrate the analysis and the computational procedure. Author

CHEMEQ: A SUBROUTINE FOR SOLVING STIFF ORDINARY DIFFERENTIAL EQUATIONS Interim Report
T. R. Young, Jr. 26 Feb. 1980 50 p refs
(zf43451001)
(AD-A083545; AD-E000395; NRL-MR-4091) Avail: NTIS
HC A03/MF A01 CSCL 09/2

A FORTRAN subroutine (CHEMEQ) which employs the Selected Asymptotic Integration Method (SAIM) for solving the stiff ordinary differential equations associated with reactive flow problems is described and documented. The SAIM algorithm identifies the stiff equations for treatment with a stiffly stable method. The remaining equations are treated with a standard classical method. The algorithm is a very low-overhead method which is particularly efficient when coupled with fluid dynamic calculations. It also gives significant reductions in computational costs for model development. The algorithm, its implementation, the FORTRAN code, the internal variables, and the argument lists are discussed and documented. The application of CHEMEQ to a test problem is also provided as an example. GRA

(Contract DAAG29-75-C-0024)
(AD-A083809; MRC-TSR-2026) Avail: NTIS
HC A03/MF A01 CSCL 12/1

This paper deals with a simple computational approach to the analysis of dynamical systems involving intermittent motion in which the velocities involved can be discontinuous due to impulsive forces, impact, mass capture, and mass release. The sequence of these events may not be known ahead of time, and may in fact be one of the things we wish the computer to determine. The dynamical equations are formulated using a logical function method due to P. Ehle. The resulting system of ordinary differential equations with discontinuous coefficients is integrated using a standard computer code in regions where the coefficients are continuous. When discontinuities occur, jump conditions across the discontinuity are used to express the new velocities in terms of the old, and the ordinary differential equation solver is simply restarted with new initial conditions. To illustrate the simplicity of the approach, the method is applied to a dynamical system of ten masses considered by Ehle. The computer code and numerical results are included. GRA

COINCIDENT BIFURCATION OF EQUILIBRIUM AND PERIODIC SOLUTIONS OF EVOLUTION EQUATIONS Technical Summary Report
Michael Shearer. Dec. 1979. 27 p. refs.
(Contract DAAG29-75-C-0024)
(AD-A083810; MRC-TSR-2027) Avail: NTIS
HC A03/MF A01 CSCL 12/1

Bifurcation of equilibrium and periodic solutions of nonlinear evolution equations is considered in the neighbourhood of an equilibrium solution for which the corresponding linear problem admits both non-zero equilibrium and non-constant periodic solutions. These solutions of the linear problem are related to those of the nonlinear equation by deriving bifurcation equations possessing a simple symmetry property. This results in a simplification of the bifurcation analysis, illustrated by a discussion of two important special cases exhibiting secondary bifurcation of periodic solutions. GRA

EXTREME VALUE THEORY FOR CONTINUOUS PARAMETER STATIONARY PROCESSES
M. R. Leadbetter. Mar. 1980. 42 p. refs.
(Contract N00014-75-C-0809)
(AD-A083802; MM-SER-1276) Avail: NTIS
HC A03/MF A01 CSCL 12/1

The central distributional results of classical extreme value theory are obtained, under appropriate dependence restrictions, for maxima of continuous parameter stochastic processes. In particular we prove the basic result (here called Gnedenko's Theorem) concerning the existence of just three types of non-degenerate limiting distributions in such cases, and give necessary and sufficient conditions for each to apply. The development relies, in part, on the corresponding known theory for stationary sequences. The general theory given does not finiteness of the number of upcrossings of any level x. However when the number per unit time is a.s. finite and has a finite mean mu(x), it is found that the classical criteria for domains of attraction apply when mu(x) is used in lieu of the tail of the marginal distribution function. The theory is specialized to this case and applied to give the general known results for stationary normal processes (for which mu(x) may or may not be finite). A general Poisson convergence theorem is given for high level upcrossings, together with its implications for the asymptotic distributions of r-th local maxima. GRA

HC A02/MF A01 CSCL 12/1

Many physical phenomena are modelled by inequalities rather than equations. In this report we examine a dynamic, or parabolic inequality, which characterizes the change of phase of a substance, e.g., ice melting, under certain assumptions. We obtain rates of convergence for certain approximation schemes which separately discretize time and space. The rates, as well as one of the schemes, appear to constitute new results in a subject which is still rather undeveloped. Subsequent investigations are also contemplated for inequalities related to different physical models. GRA

HC A04/MF A01 CSCL 12/1

The mathematical formulation of curve fitting by mechanical splines, i.e., thin, flexible, elastic beams passing through freely rotating sleeves anchored at fixed locations, is studied in this report. These are called elastica or nonlinear spline curves. As contrasted with the mathematically idealized splines, which have proven to be of considerable utility and concerning which much information is available, the nonlinear splines are relatively poorly understood. The writers are attempting to understand and systematically construct these curves. Computer graphics obtained by other workers suggest remarkable efficiency of the elastica for curve fitting. This is perhaps not too surprising since the nonlinear spline represents an equilibrium position of a thin beam. GRA

OPTIMAL SIMPLEX TABLEAU CHARACTERIZATION OF UNIQUE AND BOUNDED SOLUTIONS OF LINEAR PROGRAMS

O. L. Mangasarian. Jan. 1980. 20 p. refs.
(Contract DAAG29-75-C-0024)
(AD-A083816; MRC-TSR-2034) Avail: NTIS HC A02/MF A01 CSCL 12/1

Uniqueness and boundedness of solutions of linear programs are characterized in terms of an optimal simplex tableau. Let M denote the submatrix in an optimal simplex tableau with columns corresponding to degenerate optimal dual basic variables. A primal optimal solution is unique if and only if there exists a nonvacuous nonnegative linear combination of the rows of M corresponding to degenerate optimal primal basic variables which is positive. The set of primal optimal solutions is bounded if and only if there exists a nonnegative linear combination of the rows of M which is positive. When M is empty the primal optimal solution is unique. REGION REPRESENTATION: QUADTREE-TO-RASTER CONVERSION

Hanan Samet. Jun. 1979. 28 p. refs.
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084288; TR-768) Avail: NTIS HC A03/MF A01 CSCL 12/1

An algorithm is presented for obtaining a raster representation for an image given its quadtree. For each raster row the algorithm visits the appropriate nodes in the quadtree and, for each such node, outputs a run of length equal to the width of the corresponding block. Each block's node is visited as many times as it is high. Analysis of the algorithm reveals that its execution time is proportional to the sum of the heights of the blocks comprising the image. The total number of terminal and non-terminal nodes visited by the algorithm is also computed and shown to be a function of the number of maximal black and white blocks in the image. This means that the algorithm's execution time is directly proportional to the complexity of the image. GRA

COMPUTING THE EULER NUMBER OF IMAGE FROM ITS QUADTREE

Charles R. Dyer. May 1979. 17 p. refs.
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084289; TR-769) Avail: NTIS HC A02/MF A01 CSCL 12/1

An algorithm is presented which computes the Euler number, i.e., the number of components minus the number of holes, of a binary image represented by the quadtree. The local property counting techniques used with an array representation are generalized to counting local node configurations in a quadtree. The average worst case running time of the algorithm is proportional to the product of the number of nodes representing the components and the logarithm of the image diameter. GRA

N80-28114# Maryland Univ., College Park. Dept. of Computer Science.

A DISTANCE TRANSFORM FOR IMAGES REPRESENTED BY QUADTREES

Hanan Samet. Jul. 1979. 41 p. refs.
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084290; TR-780) Avail: NTIS HC A03/MF A01 CSCL 12/1

The concept of distance used in binary array representations of images is adapted to a quadtree representation. The Chessboard distance metric is shown to be particularly suitable for the quadtree. A Chessboard distance transform for a quadtree is defined as the minimum distance in the plane from each BLACK node to the border of a WHITE node. An algorithm is presented which computes this transform by only examining the BLACK node's adjacent and abutting neighbors and their progeny. Analysis of the algorithm shows that its average execution time is proportional to the number of leaf nodes in the quadtree. GRA

SHAPE SEGMENTATION USING RELAXATION, 2

Wallace S. Rutkowski. Jul. 1979. 26 p. refs.
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084292; TR-793) Avail: NTIS HC A03/MF A01 CSCL 12/1

The work begun in (1) on the application of relaxation to ambiguous shape segmentation is extended to include curve linking and gap filling. A chain coded input image is broken into segments based on a measure of local curvature. Gap completions linking pairs of segments are then proposed and represented in a graph structure. A second graph, whose nodes consist of paths in the above graph, is constructed, and the nodes of the second graph are probabilistically classified as various object parts.

Relaxation is then applied to increase the probability of mutually supporting classifications, and decrease the probability of unsupported decisions. A modified relaxation process using information about the size, spatial position, and orientation of the object parts yielded a high degree of disambiguation. GRA

REGION REPRESENTATION: QUADTREES FROM BINARY ARRAYS
Hanan Samet. May 1979. 14 p. refs.
(Contract DAAG53-76-C-0138; DARPA Order 3206)
(AD-A084287; TR-767) Avail: NTIS. HC A02/MF A01. CSCL 12/1

An algorithm is presented for constructing a quadtree from the array representation of a binary image. The algorithm examines each pixel in the image once and only once. In addition, as the tree is constructed, only maximal sized nodes are ever created. Thus the algorithm never requires temporary nodes. The execution time of the algorithm is equal to the number of pixels in the image. The amount of space, in addition to that necessary for the final quadtree, is proportional to the log of the image diameter. GRA

GENERALIZING THE ITERATIVE PROPORTIONAL FITTING PROCEDURE
Michael M. Meyer. Apr. 1980. 44 p. refs.
(Contract N00014-78-C-0151)
(AD-A084429; TR-371) Avail: NTIS. HC A03/MF A01. CSCL 12/1

The Iterative Proportional Fitting Procedure (IPFP) can be viewed as a method for maximizing the likelihood for certain loglinear models or equivalently for minimizing the Kullback-Leibler information between two probability densities. Both of these viewpoints lead to natural generalizations of the classical IPFP. We examine the generalizations, and with the aid of the theory, explore a practical example of expanding a contingency table. GRA

DEPENDENT RELEVATIONS
N. L. Johnson. Research Triangle Park, N.C. Army Res. Office. Mar. 1980. 13 p. refs.
(Contract DAAG29-77-C-0035; Grant AF-AFOSR-3673-78)
(AD-A084543; MMS-1273; ARO-14778.10-M) Avail: NTIS. HC A02/MF A01. CSCL 12/1

Krakowski (1973) introduced the concept of the relevation, which is the conditional distribution of a random variable sub 2, given that it exceeds an independent random variable x sub 1. This is relevant to failure time distributions when replacement is made from an aging stock. We develop analysis appropriate to relevation for dependent variables, and suggest it might be relevant if there is batch-to-batch variation, producing association between lifetimes of initial and replacement components. GRA

MODERN EMPIRICAL STATISTICAL SPECTRAL ANALYSIS
Emanuel Parzen. May 1980. 29 p. refs.
(Contract N00014-78-C-0599)
(AD-A084142; TR-N-12) Avail: NTIS. HC A03/MF A01. CSCL 12/1

This paper has two aims: to provide perspectives on the diverse paths of analysis which are available in 1980 to estimate the spectrum of an observed time series, and to describe proposals for optimal statistical spectral estimation procedures which combine autoregressive spectral estimators and log spectral estimators. It is proposed that empirical statistical spectral analysis should be an adaptive procedure for forming an iterative spectral estimator (an iterative estimator is one composed of estimators obtained in different steps of the analysis). There are three parts: (1). Basic concepts of time series spectral analysis; (2) entropy distances, autoregressive spectral estimators and log spectral estimators; and (3) an outline of empirical spectral analysis. GRA

ANALYSIS OF COMPUTATIONAL METHODS FOR NONLINEAR PARABOLIC DIFFERENTIAL SYSTEMS. Final Report
R. Leonard Brown. Apr. 1980. 59 p. refs.
(Grant AF-AFOSR-0024-79)
(AD-A084236; UVA/525629/AMC80/101; AFOSR-80-0340TR) Avail: NTIS. HC A04/MF A01. CSCL 12/1

Many important problems in fluid dynamics, among other areas, are modeled by nonlinear parabolic differential systems with initial values given in one independent variable, x, and boundary values in the remaining dependent variables. Hyperbolic systems can sometimes be treated as a special case. For example, the inviscid flow case of the Navier-Stokes equations is a hyperbolic system, while the viscous flow case is elliptical. A survey of currently used numerical methods is in Richtmeyer and Morton. In subsonic flow cases, the nonlinear terms are small enough to be ignored, but these terms must be included in supersonic and hypersonic flow. These numerical calculations usually involve a finite difference mesh over the boundary value problem variables, resulting in a space discretization matrix equation which for the nonlinear system varies at each step in x, the independent variable representing time in the dynamic case or one of the space variable for the steady state case. Then this nonlinear system is solved as an initial value problem in x. The initial value problem is usually solved by a one step implicit method for reasons of cost and stability. Some methods based on finite element methods for the boundary value problem can be used, but successful methods are only available for the linear cases, such as subsonic flow problem. GRA

RATES OF CONVERGENCE FOR ESTIMATION AND TESTING IN MULTINOMIAL DISTRIBUTIONS Ph.D. Thesis
Kenneth Henry Sutrick 1979 181 p
Avail: Univ. Microfilms Order No. 8014900

Various problems involving the multinormal distribution are presented. An asymptotic power comparison between the likelihood ratio test and a class of chi squares tests is demonstrated. An estimation of a single parameter is given and expansion for the estimators and their mean square error are given. It is shown that there are other estimation procedures which have the same properties as minimum chi square and maximum likelihood estimates. Dissert. Abstr.

N80-28126 Florida State Univ., Tallahassee.
AN INVESTIGATION OF OUTLIER DEFINITION AND THE IMPACT OF THE MASKING PHENOMENON ON SEVERAL STATISTICAL OUTLIER TESTS Ph.D. Thesis
Patricia Little Fisher 1980 165 p
Avail: Univ. Microfilms Order No. 8014123

The problem of statistical outliers is examined. Different possible approaches to outlier identification are discussed, and the highlights of the development of outlier tests and the competing methods of multiple outlier detection, consecutive and block procedures, are explained. The masking problem, which hinders effective application of the consecutive procedures, is described, as are several other problems which complicate the outlier issue for the research practitioner. Dissert. Abstr.

N80-28127 Maryland Univ., College Park.
A MONTE CARLO APPROACH TO THE SAMPLING ERROR OF ESTIMATES OF THE GENERALIZABILITY STATISTICS FROM A TWO FACET COMPLETELY CROSSED GENERALIZABILITY STUDY Ph.D. Thesis
James Anthony DiStefano 1979 159 p
Avail: Univ. Microfilms Order No. 8016346

A Monte Carlo approach was used to study the sampling error of estimates of the generalizability coefficient and errors DELTA and delta from a two facet (three factor) completely crossed generalizability study, systematically varying the number of levels of each facet sampled and the population variance component configuration. Estimates were obtained by the analysis of variance. All negative component estimates were set equal to zero. Generalizability coefficients computed with negative variances set equal to zero were compared with coefficients computed by including negative variance estimates. Ten variance component configurations were selected. Within each variance component, sampling error was investigated using eight (P,I,J) sampling plans. It is shown that much smaller sample sizes could be used in configurations having large persons components and small interactions. It was also shown that for sample sizes less than 100 generalizability coefficients computed with negative variance estimates unchanged provided a more accurate estimate of the universe value of the generalizability coefficient. Dissert. Abstr.

N80-28128 North Carolina Univ. at Chapel Hill.
SAMPLING REPRESENTATIONS AND APPROXIMATIONS FOR CERTAIN FUNCTIONS AND STOCHASTIC PROCESSES Ph.D. Thesis
Muhammad Kamel Habib 1979 99 p
Avail: Univ. Microfilms Order No. 8014204

Finite sampling approximations are derived for certain functions and processes which are not bandlimited, as well as bounds on the approximation errors. Also derived are sampling representations for bounded linear operators acting on certain classes of bandlimited functions and processes; these representations enable one to reconstruct the image of a function (or a process) under a bounded linear operator using the samples of the function (or the process) rather than the samples of the image. Sampling representations for distributions and random distributions are obtained. Dissert. Abstr.

N80-28129 State Univ. of New York, Buffalo.
MODELING AND INVESTIGATION OF PERIODIC PHENOMENA USING TECHNIQUES OF TIME SERIES ANALYSIS Ph.D. Thesis
Jessica Pollner 1980 241 p
Avail: Univ. Microfilms Order No. 8016232

Periodic autoregressive models as a means of modeling and analyzing time series was investigated. The theory of both univariate and multivariate times series was applied and extended to periodic processes, with particular attention focused on autoregressive models. The periodic autoregressive model led to the consideration of estimators, easily implemented algorithms and data analytic applications. Regression models were proposed and investigated as additional model types for analyzing periodic processes. An attempt was made to extend the association of regression models and univariate autoregressive schemes to that of periodic autoregressions. Dissert. Abstr.

ON PROBABILITY DISTRIBUTIONS INVOLVING THE STIRLING NUMBERS Ph.D. Thesis
Ramalingam Shanmugam 1979 68 p
Avail: Univ. Microfilms Order No. 8014511

The maximum likelihood and the minimum variance unbiased and the bayesian estimators of the poisson probabilities were compared. Expressions for the bias, and the mean square error were derived, and expressed in terms of the Stirling numbers of the second kind. All three estimators are shown to be consistent. Dissert. Abstr.

N80-28131 California Univ., Berkeley.
RECURSIVE ESTIMATION IN TIME SERIES MODELS Ph.D. Thesis
Knut Kristian Aase 1979 162 p
Avail: Univ. Microfilms Order No. 8014589

An adaptive estimation principle is considered for both standard and nonstandard time series models. General nonlinear, non-Markovian, continuous processes are considered and several optimality properties are shown to hold for the resulting estimator, using Ito's stochastic calculus. A number of applications are discussed, possible extensions are indicated, and Monte Carlo simulations are used throughout to guide the directions taken and to support the theoretical findings. Dissert. Abstr.

N80-28132# Missouri Univ. - Columbia. Dept. of Statistics.
MAXIMUM LIKELIHOOD ESTIMATION OF THE SURVIVAL FUNCTIONS OF STOCHASTICALLY ORDERED RANDOM VARIABLES
Richard L. Dykstra Mar. 1980 26 p refs
(Contract N00014-78-C-0655)
(AD-A083903; TR-91) Avail: NTIS HC A03/MF A01 CSCL 12/1

Many times populations exist which logically must satisfy a stochastic ordering requirement. Nevertheless, estimates of these populations may not bear out this stochastic ordering because of the inherent variability of the observations. This paper will consider the problem of finding maximum likelihood estimates of stochastically ordered survival functions for the cases (1) one survival being fixed in advance and (2) estimating both survival functions when the data includes censored observations. A numerical example is handled in detail to illustrate the solution to this problem. GRA

CONTINGENCY TABLES
Stephen E. Fienberg. Feb. 1980. 32 p. refs. Submitted for publication.
(Contract N00014-78-C-0600)
(AD-A084262; TR-369) Avail: NTIS HC A03/MF A01 CSCL 12/1

This paper is concerned primarily with the use of loglinear models for the analysis of contingency table data. An introduction to multivariate statistical analysis is presented and the topic is placed in an historical perspective. Examples which illustrate some of the methods of analysis are described. The basic statistical theory associated with maximum likelihood estimation and loglinear models is outlined and the results are applied to the examples. The paper concludes with a guide to some recent applications of loglinear and contingency table modelling, and to computer programs for contingency table analysis. GRA

OPTIMAL STATIONARY LINEAR CONTROL OF THE WIENER PROCESS Interim Report
Vaclav E. Benes (Bell Telephone Labs, Murray Hill) and Ioannis Karatzas (Columbia Univ.). 29 Feb. 1980. 33 p. refs. Present at the Conf. on Stochastic Processes and Their Applications, Evanston, Ill., Aug. 1979.
(Grant AF-AFOSR-3063-76; AF Proj. 2304)
(AD-A084350; AFOSR-80-0338TR) Avail: NTIS HC A03/MF A01 CSCL 12/1

In this paper we consider the problem of stationary control of the stochastic differential equation where (W sub t) is a Wiener process on an underlying probability space. Two kinds of cost are involved in this problem. First, one pays Phi (zeta sub t) per unit time for being in the wrong state zeta sub t; secondly, one pays u sub t per unit time for using the control law u sub t. The control problem is to choose a law so as to minimize the average expected total cost. It is proved that the optimal law can be explicitly described and its performance characterized in terms of the cost function. GRA

A PREDICTION INTERVAL FOR A FIRST ORDER GAUSSIAN MARKOV PROCESS
Toke Jayachandran and T. S. Murthy. Apr. 1980. 25 p. ref.
(RR0000110)
(AD-A084094; NPS53-80-002) Avail: NTIS HC A02/MF A01 CSCL 12/1

A mathematical model of coupled heat and moisture flow in soils has been developed. The model includes algorithms for phase change of soil moisture and frost heave, and several types of boundary and initial conditions are permitted. The finite element method of weighted residuals Galerkin procedure was chosen to simulate the spatial regime and the Crank-Nicholson method was used for the time domain portion of the model. To facilitate evaluation of the model, the heat and moisture fluxes were essentially 'decoupled' moisture flux was then simulated accurately, as were heat flux and frost penetration. The coupled model was used to simulate frost penetration and frost heave in a laboratory test. Comparison of the simulated and experimental data illustrates the importance of unsaturated hydraulic conductivity. It is one parameter which is difficult to measure and for which only a few laboratory test results are available. Therefore, unsaturated hydraulic conductivities calculated in the computer model may be a significant source of error in calculations of frost heave. The algorithms incorporating effects of surcharge and overburden was evaluated. Time dependent frost penetration and frost heave in laboratory specimens were closely simulated with the model. GRA

A GENERAL MIXTURE-TRUNCATION METHOD FOR GENERATING BIVARIATE RANDOM VARIABLES FROM UNIVARIATE GENERATORS M.S. Thesis
Myong Ho Shin (Korean Air Force). Mar. 1980. 172 p. refs.
(AD-A084474) Avail: NTIS HC A08/MF A01 CSCL 12/1

This thesis deals with the generation of bivariate random variables with identical marginal distributions and specified correlation coefficients. Many schemes have been put forward for different cases; they almost always involve computing the inverse probability distribution of the marginal distributions or exploiting special properties of the random variables in question. A simple mixture-truncation method is put forward here to generate bivariate distributions with any marginal distribution from univariate generators. GRA

A POINT MAPPING STUDY OF DYNAMICAL SYSTEMS Ph.D. Thesis
Henryk Flashner. 1979. 184 p.
Avail: Univ. Microfilms Order No. 8014677

A method to obtain an approximation for period to period mapping of multidimensional periodic systems is proposed. It is shown that the method can be applied to a large class of dynamical systems governed by differential equations with periodically varying coefficients. The proposed method is based on the Runge-Kutta algorithm for solving a set of ordinary differential equations. The only limitation of the method is the size of computer memory needed to store the various terms of the point mapping. Computer programs implementing the proposed method to one and two degree of freedom systems are given. The programs

are used to compute the point mapping of two example dynamical systems with periodically varying coefficients. Application of the method to obtain an approximation of the Strutt diagram of the Mathieu equation is given. Dissert. Abstr.

A SYSTEMATIC APPROACH FOR THE DESIGN AND ANALYSIS OF DISTRIBUTED COMPUTER SYSTEMS Ph.D. Thesis
Gary Shiu-Fan Ho 1979 168 p
Avail: Univ. Microfilms Order No. 8014735

A systematic approach for the design and analysis of computer systems is presented. A top down development approach for computer systems, and some analysis techniques for system performance and system deadlocks are developed. Dissert. Abstr.

N80-28142 Illinois Univ. at Chicago Circle, Chicago.
ALGORITHMS FOR SOLVING SOME UNDISCOUNTED STOCHASTIC GAMES Ph.D. Thesis
Jerzy Andrzej Filar 1980 118 p
Avail: Univ. Microfilms Order No. 8014224

Zero-sum stochastic games are studied with finite state and action spaces in which payoffs are undiscounted. In fact, payoffs will be evaluated according to a limiting expected average criterion. Such a criterion is meaningful only if both players expect the game to continue indefinitely and if discounting of payoffs is inappropriate. All of the undiscounted games studied here are constrained by some natural restrictions on strategic possibilities of the players. In addition to being mathematically expedient, the assumptions made about the games studied are easily verifiable and preserve the competitive nature of undiscounted stochastic games. The following main results are presented: (1) A finite-step algorithm is given which solves any undiscounted stochastic game in which one player controls the transitions (i.e., probability transitions are functions of the actions of one player only). The value and optimal stationary strategies for both players can be found by this method. (2) For an undiscounted game in which payoffs and transition probabilities lie in the same ordered Archimedean field and in which one player controls transitions in some states while the other player controls transitions in remaining states, a constructive proof of the existence of the value and of optimal stationary strategies for both players is given. Dissert. Abstr.

SATELLITE AND MISSILE DATA GENERATION FOR AIS Final Technical Report, 1 Sep. 1978 - 31 Aug. 1979
Georgette M. Silva and Christine A. Montgomery Griffiss AFB, N.Y. RADC Dec. 1979 194 p refs
(Contract F30602-78-C-0274; AF Proj. 4594)
(AD-A084326; OSI-R79-037; RADC-TR-79-314) Avail: NTIS HC A09/MF A01 CSCL 09/4

The effort described specifically addressed the problem of deriving indicator and descriptor data from the narrative text portions of a class of intelligence messages dealing with events related to missile and satellite launchings used for input to the Advanced Indicator System (AIS) data base. The introductory section briefly discusses the intelligence problem which OSI's event processing technology intends to solve, summarizes the technology developed under this contract, and presents the conclusions drawn on the basis of the results obtained. Section 2 offers a summary of OSI's methodological approach to the analysis and description of event reports. This methodology, initially developed on the basis of messages dealing with air activities, was, under this contract, extended to cover reports of events involving missile and satellite launchings and related events. Section 3 describes the Missile and Satellite domains, and presents the results of their analysis in terms of a domain definition. The discussion includes a characterization of the event report in terms of its component messages; a list of the message types encountered in the domains under consideration; a list of the event types identified together with their descriptor system, and a definition of the sublanguage in terms of its vocabulary and syntax. Section 4 focuses on the implementation of OSI's message text analysis system, MATRES II. It briefly reviews the principles underlying OSI's event processing technology and offers an overview of MATRES. GRA

APPLICATION OF BEST LINEAR UNBIASED PREDICTION TO INTERPOLATION OF RANDOM FIELDS AND TO NETWORK DESIGN
Andre Cabannes Apr. 1980 34 p refs
(Contract N00014-75-C-0555)
(AD-A083656; TR-17) Avail: NTIS HC A03/MF A01 CSCL 12/2

The practical problem of monitoring air pollutant concentration over a geographical area, or of estimating the mining resources in a region or a field can both be formulated as a problem of interpolation of random field. Given a real-valued random field (Z(X);x an element of R to the m power) the basic problem is to interpolate Z over an area A from measurements taken at n stations x1 ,x2, ,xn, when the distribution of Z is only partially specified. The second problem is the choice of the network of stations. After deriving the form of the best linear unbiased predictor of Z we prove a general updating theorem which is useful both practically to quicken the computation of the new estimated map, and theoretically to study the problem of network design. Then we use this theorem to prove that when Z is a smooth random field (essentially differentiable in quadratic mean) the variance of estimation error of Z(x) is a discontinuous function of the arguments x1,x2,...,xn. We discuss the practical consequences of this result in the design of networks of stations. GRA

SOLUTION APPROACHES FOR NETWORK FLOW PROBLEMS WITH MULTIPLE CRITERA
Darwin Klingman and John Mote (Systems Analyst, Analysis, Research and Computation, Inc.) Dec. 1979 41 p refs
(Contract N00014-78-C-0222)
(AD-A084283; CCS-363) Avail: NTIS HC A03/MF A01 CSCL 12/2

A network variant of the multicriteria linear programming problem is presented. The primal simplex multicriteria algorithm first developed by Yu and Zeleny is specialized to handle the simple basis structure of the multicriteria uncapacitated transshipment problem. Specifically, the basis tree representation and updating techniques that have proven to be successful for single criterion network flow problems are used to substantially reduce the computational effort required for the multicriteria simplex algorithm. The fundamental theoretical results for the general multicriteria linear programming problem are presented followed by a brief review of the relevant aspects of the network basis structure. Next, the specialized multicriteria primal simplex algorithm for the uncapacitated transshipment problem is presented and a small example problem is given. Then a network variant of the surrogate criterion linear programming approach is presented. For sake of illustration, the shortest path problem is used as the class of networks to be solved. However this approach can be easily extended to any of the other classes of network flow problems. In this section an interactive solution procedure is described that involves both the decision maker and the computer at each stage. GRA

MEASUREMENTS OF THE TEMPERATURE DEPENDENT DIAMAGNETISM OF LIQUIDS Ph.D. Thesis
Richard Keith Kunze 1979 179 p
Avail: Univ. Microfilms Order No. 8016207

Measurements of temperature dependence of the diamagnetism of various liquids performed using a high precision (10 to the 10th power SI) superconducting magnetic susceptometer are reported and discussed. A microprocessor-based signal processing system was developed allowing the elimination of systematic error due to the background signal from the quartz sample holder and due to linear output drift. Partly to evaluate the temperature regulation of this prototype susceptometer, a measurement of the change in volume susceptibility at the well-studied gel to liquid crystal phase transition of dipalmitpyphosphatidylcholine vesicle dispersions was performed. The observed change is consistent with the known density change of the phospholipid bilayer and the assumption that the mass susceptibility of the system is constant through the transition. The measurements of methanol, acetic acid, deuterium oxide, chloroform, acetone, carbon tetrachloride, carbon disulfide, cyclohexane, and nitrobenzene indicate that hydrogen bonding is not a necessary condition for temperature dependent diamagnetism in liquids. Dissert. Abstr.

REPRESENTATION OF PHYSICS KNOWLEDGE BY EXPERTS AND NOVICES
Michelene T. Chi, Paul J. Feltovich, and Robert Glaser 21 Mar. 1980 68 p refs
(Contract N00014-78-C-0375; NR Proj. 157-421)
(AD-A084452; TR-2) Avail: NTIS HC A04/MF A01 CSCL 12/2

The studies reported here investigate the representation and organization of physics knowledge in experts and novices. Four experiments investigate the existence of schemata for physics problems, qualitative and quantitative differences in schemata types used by experts and novices, differences in the content of these schemata, and features in the physics problems that activate problem representations. Results obtained from problem sorting tasks and protocol analysis reveal that novices and experts begin with specifiably different problem representations depending on the structure of their knowledge. The initial representation and subsequent approach to problem solution used by experts is based on physics principles abstracted from a problem, while novices base their representation and approaches on the problem's literal features. AN INVESTIGATION OF THE LOW-FREQUENCY SOUND FIELD OF A REVERBERANT ENCLOSURE AND THE EFFECTS OF DIGITAL ELECTRONIC FEEDBACK Ph.D. Thesis
John Baptist Ochs 1980 220 p
Avail: Univ. Microfilms Order No. 8015825

Low frequency fluctuation of the characteristics of the sound field was investigated in comparion to those characteristics at high frequency. Electronic feedback, using a single Finite Impulse Response (FIR) filter was implimented to beneficially change the degree of diffusion to increase the useful frequency range of reverberant enclosures for sound power measurements. This investigation included a computer model study and a experimental study in a model enclosure of the frequency-by-frequency fluctuation of the time-averaged spatial mean squared pressure as as it relates to sound power measurements; the normalized spatial variance, the probability density function and the cumulative distribution function of time-averaged squared pressure normalized to the spatially averaged cross correlation coefficient; and the vector intensity. The data from both the computer model and the experimental model showed that the feedback implemented did not significantly affect the diffusion of the sound field. Dissert. Abstr.

ASSESSMENT OF THE ENVIRONMENTAL COMPATIBILITY OF DIFFERING HELICOPTER NOISE CERTIFICATION STANDARDS Final Report
Richard G. Edwards, Alvin B. Broderson, Roger W. Barbour, Donald F. McCoy, and Charles W. Johnson Jun. 1979 67 p refs
Prepared in cooperation with Kentucky Univ., Lexington
(Contract DOT-FA78WA-4194)
(AD-A080525; FAA-AEE-79-13) Avail: NTIS HC A04/MF A01 CSCL 01/2

Areas having the heaviest helicopter activity in the U.S. were visited and environmental noise measurement made in order to evaluate the impact of possible relaxed noise emission standards

for helicopters restricted to remote regions. Measurement results showed that an average of 10 flyovers per hour produced a one hour energy-averaged sound level (Leq) of 54.5 dBA, a level 2.5 dBA above ambient. An average of 34 events per hour adjacent to heliports produced a one-hour Leq of 63.1 dBA, which was 13.3 dBa above ambient. If emission levels were increased by 10 dBA, projected Leq values of 57.0 and 71.2 dBA resulted for the flyover and heliport conditions, respectively. Sixty-four percent of those responding to a questionnaire stated that they had not experienced a problem from helicopter noise. The degree to which the remaining respondents were bothered ranged from (slightly) to (very annoyed) with no significant preference for either category. GRA

SURFACE WAVES AND ANOMALOUS SOUND ABSORPTION Final Report
Ronald L. Kligman 1 Jan. 1980 51 p refs
(SF43452702)
(AD-A083844; NSWC-TR-79-481) Avail: NTIS HC A04/MF A01 CSCL 20/1

A theoretical model of surface waves in equilibrium with acoustic waves at a fluid-fluid interface is developed. Modifications to the usual pressure and particle velocity boundary conditions lead to a dispersion relation for the waves of the coupled system. An expression for the total reflection coefficient is found. The ratio of acoustic energy absorbed due to reflection from the interface to the incident wave energy is calculated making use of the previously obtained reflection coefficient. GRA

CORRECTION PROCEDURES FOR AIRCRAFT NOISE DATA. VOLUME 1: PSEUDOTONES Final Report
R. Rackl Dec. 1979 210 p refs
(Contract DOT-FA78WA-4143)
(AD-A081962; WR-79-9-Vol-1; FAA/EE-80-1-Vol-1) Avail: NTIS HC A10/MF A01 CSCL 20/1

Pseudotones are spectral irregularities due to ground reflections which can cause tone corrections in the calculation of Effective Perceived Noise Level which are not generated by the aircraft itself. Several analytical (reflection theory, lower cutoff frequency for tone corrections) and instrumentation (ground and pole microphones) methods were investigated which remove the pseudotones. In support of this study, a substantial number of aircraft noise measurements were obtained and analyzed in detail; these data are also summarized in the report. GRA

CORRECTION PROCEDURES FOR AIRCRAFT NOISE DATA. VOLUME 2: BACKGROUND NOISE CONSIDERATIONS Final Report
L. Sutherland, J. Parkinson, and D. Hoy Dec. 1979 115 p
(Contract DOT-FA78WA-4143)
(AD-A082011; WR-79-9-Vol-2; FAA-EE-80-1-Vol-2) Avail: NTIS HC A06/MF A01 CSCL 20/1

The impact of background noise on the value of PNL, PNLT, and the resulting EPNL noise metric in aircraft certification to FAR Part 36 is examined in this report, the second in a series of reports on aircraft noise measurement correction procedures. Procedures to remove background noise effects from data measured in the form of one-third octave band sound pressure levels for jet and large propeller aircraft, or data in the form of A-weighted noise levels for light propeller driven aircraft, are defined. After evaluating various techniques for different ratios of signal-to-background noise, one simple correction method for turbojet/turbofan aircraft noise is proposed. The recommended method consists of applying an energy correction, up to a maximum of -10 dB, for that portion of the background noise spectra dominated by energy-adding or predetection background noise. For the remaining portion of the background noise spectra, the non-additive postdetection background noise floor tends to mask out bands very close to or below this noise floor. A simple spectrum extrapolation procedure is recommended in this case. Another background noise correction method for light propeller aircraft noise is also proposed. This procedure simply involves application of an energy correction to the 'as measured' A-weighted aircraft signal using the A-weighted background noise level. Procedures are also suggested for measuring the background noise level in order to account for the randomness of the fluctuating background noise level. GRA

THE EFFECTS OF HIGH LEVEL INFRASOUND
Daniel L. Johnson Feb. 1980 16 p refs presented at Conf. on Low Freq. Noise and Hearing, Aalborg, Denmark, 7-9 May 1980 Submitted for publication
(AF Proj. 7321; AF Proj. 7184)
(AD-A081792; AMRL-TR-80-13) Avail: NTIS HC A02/MF A01 CSCL 06/19

This paper will attempt to survey the current knowledge on the effects of relative high levels of infrasound on humans. While this conference is concerned mainly about hearing, some discussion of other physiological effects is appropriate. Such discussion also serves to highlight a basic question, 'Is hearing the main concern of infrasound and low frequency exposure, or is there a more sensitive mechanism'. It would be comforting to know that the focal point of this conference is indeed the most important concern. Therefore, besides hearing loss and auditory threshold of infrasonic and low frequency exposure, four other effects will be provided. These are performance, respiration, annoyance, and vibration. TRANSIENT ACOUSTIC WAVE PROPAGATION IN AN EPSTEIN DUCT Summary Report
Calvin H. Wilcox Nov. 1979 50 p refs
(Contract N00014-76-C-0276)
(AD-A083484; TR-36) Avail: NTIS HC A03/MF A01 CSCL 20/1

Transient acoustic wave propagation is analyzed for the case of an unlimited plane-stratified fluid having constant density and sound speed c (y) at depth y given by the Epstein profile 1/c squared (y) + K sech squared (y/H) + L tanh (y/H) + M. The acoustic potential is a solution of the wave equation Dt squared u-c squared (y) (D1 squared u + D2 squared u + Dy squared u) = f(t,x,y) where x = (x sub 1, x sub 2) are horizontal coordinates

and f(t,x,y) characterizes the wave sources. The principle results show that u is the sum of a free component, which behaves like a diverging spherical wave for large t, and a guided component which is approximately localized in a region abs. val. (y-y sub o) < or = h and propagates outward in horizontal planes like a diverging cylindrical wave. M.G.

72 ATOMIC AND MOLECULAR PHYSICS

Includes atomic structure and molecular spectra.

N80-28161 California Univ., Los Angeles.
STUDIES IN INTRAMOLECULAR MOTION Ph.D. Thesis
Paul Richard Stannard 1980 137 p
Avail: Univ. Microfilms Order No. 8016046

Five self contained articles written for scientific journals that all deal with the dynamical behavior of an isolated molecule in an excited energy state are presented. The first differs from the rest however, and examines the effect of coupling between vibrational levels belonging to different Born-Oppenheimer electronic states. The remaining four articles are all concerned with the Local Mode Model of molecular vibrations (in only one electronic state). Both the Local Mode (LM) and the better known Normal Mode (NM) model seek to separate the complicated many dimensional vibrational motion of a polyatomic molecule into a superposition of one dimensional oscillations. The question of which is the best zeroth-order description is examined and qualitative and quantitative criteria are introduced. A calculation to compare the effectiveness of NM and LM approximations in describing the fundamental absorptions in water is described along with the question of molecular symmetry in a LM picture. The effect of breakdown of separability on intramolecular dynamics, in glyoxal, water and benzene is explained.

STUDIES IN THE IONIZATION OF ATOMS AND IONS BY PHOTONS Ph.D. Thesis
David John Botto 1979 206 p
Avail: Univ. Microfilms Order No. 8015291

Three aspects of the ionization of atoms and ions by photons are discussed. (1) Analytic expression previously derived for neutral atoms are employed to describe inner shell nonrelativistic dipole photoeffect cross sections for positively charged atomic ions. The simple dependence of these cross sections on nuclear charge Z and ionic charge Z results from scaling. (2) A numerical calculation of the radiative corrections to the atomic photoeffect is performed for the K shell of a hydrogenlike atom to lowest order in radiation field assuming the polarization of the electron and photon are not observed. Dependence of these corrections on the photon energy and the detector's energy resolution are discussed. (3) A survey of the present status of the theory and experiment for Compton scattering is given. The validity of the various theoretical approaches is discussed. A formalism for the calculation of Compton scattering cross sections in a relativistic partial wave expansion in a central potential is developed. Dissert. Abstr.

N80-28163 California Univ., Berkeley.
MULTIPHOTON DISSOCIATION OF POLYATOMIC MOLECULES Ph.D. Thesis
Peter Anfaenger Schulz 1979 138 p
Avail: Univ. Microfilms Order No. 8014823

The dynamics of infrared multiphoton excitation and dissociation of SF6 was investigated under collision free conditions by a crossed laser-molecular beam method. In order to understand the excitation mechanism and to elucidate the requirements of laser intensity and energy fluence, a series of experiments were carried out to measure the dissociation yield dependences on energy fluence, vibrational temperature of SF6, the pulse duration of the CO2 laser and the frequency in both one and two laser experiments. Translational energy distributions of the SF5 dissociation product measured by time of flight and angular distributions and the dissociation lifetime of excited SF6 as inferred from the observation of secondary-dissociation of SF5 into SF4 and F during the laser pulse suggest that the dynamics of dissociation of excited molecules is dominated by complete energy randomization and rapid intramolecular energy transfer on a nanosecond timescale, and can be adequately described by RRKM theory. Dissert. Abstr.

N80-28164 California Univ., Berkeley.
MULTIPHOTON PROCESSES IN ISOLATED ATOMS AND MOLECULES Ph.D. Thesis
Aasmund Sveinung Sudbo 1979 160 p
Avail: Univ. Microfilms Order No. 8014899

The theory of coherent excitation of a multilevel quantum mechanical system is developed. Damping of the system is taken into account by the use of a density matrix formalism. General properties of the wave function and/or the density matrix are discussed. The physical implications for the behavior of the system are described, together with possible applications of the formalism, including the infrared multiphoton excitation of molecules, and optical pumping in alkali atoms. Experimental results on the infrared multiphoton dissociation of molecules are presented followed by a discussion of the general features of this process. The experimental results were obtained using a crossed laser and molecular beam method, and the emphasis is on determining the properties of the dissociating molecule and the dissociation products. The dissociation process is shown to be described very well by the standard statistical theory (RRKM theory) of unimolecular reactions, a brief presentation of which is also included. Dissert. Abstr.

N80-28165 California Univ., Berkeley.
LASER INDUCED FLUORESCENCE OF TRAPPED MOLECULAR IONS Ph.D. Thesis
Frederick Joseph Grieman 1979 251 p
Avail: Univ. Microfilms Order No. 8014713

An experimental apparatus for obtaining the optical spectra of molecular ions is described. The experimental technique includes the use of three dimensional ion trapping, laser induced fluorescence, and gated photon counting methods. In the laser induced fluorescence technique employed in this experiment the ions, after being stored and mass selected, are interrogated by an intense, narrow bandwidth dye laser pulse ten nanoseconds in duration. Any subsequent fluorescence is not dispersed but is detected by a bare photomultiplier tube. The signals is further enhanced by signal averaging which is accomplished using an on-line minicomputer. The computer also controls the progress of the experiment and normalizes the fluorescence signal with respect to laser power and ion density which are monitored throughout the experiment. The result is a fluorescence excitation spectrum which in many instances contains the same information as an absorption spectrum. The spectra of the molecular ions studied by this experimental technique are presented.
Dissert. Abstr.

N80-28166 California Univ., Berkeley.
CROSSED BEAM STUDIES OF FULL AND HALF COLLISIONS Ph.D. Thesis
Randal Kenneth Sparks 1979 171 p
Avail: Univ. Microfilms Order No. 8014889

The results of two experiments performed on very high resolution crossed molecular beams apparatus are discussed. The first experiment, photofragmentation of methyl iodide, is deconvoluted to yield vibrational state distributions for the recoiling methyl fragment. These distributions are then analyzed in terms of half-collision models and Franck-Condon factors. The second experiment, a full-collision example, is the reaction of F atoms with H2 and D2. Laboratory angular and velocity distributions for both systems are obtained at several energies. Center-of-mass product distributions are calculated and discussed in terms of recently predicted state dependent resonance phenomena for the reaction. The design of the apparatus is also discussed.
Dissert. Abstr.

TABLES OF TRANSITION PROBABILITIES AND BRANCHING RATIOS FOR ELECTRIC DIPOLE TRANSMISSIONS BETWEEN ARBITRARY LEVELS OF HYDROGEN-LIKE ATOMS

Kazem Omidvar Jun. 1980 35 p refs
(NASA-TM-80682) Avail: NTIS HC A03/MF A01 CSCL 20H

Branching ratios in hydrogen-like atoms due to electric-dipole transitions are tabulated for the initial principal and angular momentum quantum number n, lambda, and final principal and angular momentum quantum numbers n, lambda. In table 1, transition probabilities are given for transitions n, lambda, yields n, where sums have been made with respect to lambda. In this table, 2 < or = n' < or = 10, o < or = lambda' < or = n'-1, and 1 < or = n < or = n'-1. In addition, averages with respect to lambda' and sums with respect to n, and lifetimes are given. In table 2, branching ratios are given for transitions n' lambda' yields n, where sums have been made with respect to lambda. In these tables, 2 < or = n' < or = 10, 0 < or = lambda', < n'-1, and 1 < or = n < or = n'-1. Averages with respect to lambda' are also given. In table 3, branching ratios are given for transitions n' lambda' yields in lambda, where 1 < or = n < or = 5, 0 < or = lambda < or = n-1, n < n' < or = 15, and 0 < or = lambda' < or = n(s), where n(s), is the smaller of the two numbers n'-1 and 6. Averages with respect to lambda' are given. Author

LOW ENERGY X-RAY AND ELECTRON INTERACTIONS WITHIN MATTER Interim Scientific Report, 1 Oct. 1978 - 30 Sep. 1979
Burton L. Henke Mar. 1980 65 p refs
(Grant AF-AFOSR-0027-79; AF Proj. 2301)
(AD-A083962; AFOSR-80-0294TR) Avail: NTIS HC A04/MF A01 CSCL 20/8

This research program is concerned with the physics and the application of low energy X-ray and associated electron interactions. It has been concentrated upon the sub-kilovolt energy region where the need has been greatest for the development of efficient and precise spectroscopic methods, for the measurement of fundamental interaction cross sections, and for the basic theoretical modeling of certain important X-ray and electron interaction processes as, for example, X-ray induced photoemission and fluorescence. This work is applied to two areas of considerable present importance and need: the development of high efficiency spectroscopic methods that can be effectively applied to the diagnostics of high temperature plasmas - particularly as generated by high power pulsed lasers, electron or ion beams and by exploding wires, for which high temporal resolution as well as high spectral resolution is needed; and the testing and application of high-efficiency low-energy fluorescent spectroscopic measurement and analysis for valence and molecular orbital electron energy state studies, for the solid state characterization of surfaces, and for studies of the effects of radiation damage. GROWTH OF HgCdTe BY MODIFIED MOLECULAR BEAM EPITAXY (MBE) Semiannual Technical Report, 1 Sep. 1979 - 29 Feb. 1980
J. T. Cheung Mar. 1980 33 p refs
(Contract MDA903-79-C-0188; DARPA Order 3704)
(AD-A083799; SC5202.6SA) Avail: NTIS HC A03/MF A01 CSCL 07/4

An investigation was made on the deposition of HgCdTe thin film on CdTe by irradiating the bulk source material with high power laser pulses. The morphological features and stoichiometric composition depend very strongly on the laser characteristics and the scanning rate. Under very high power operation, the dominant deposition process is the condensation of micron size molten globules 'blown-off' from the source material. At lower power level, the film formation is largely due to the deposition of small molecular clusters. Compositional analysis of the film showed that the CdTe end of the alloy evaporated congruently, whereas the HgTe and end suffered some loss of Hg. The amount of Hg loss could be reduced by varying the laser power and the scanning rate. N-type films up to 2 microns thick were deposited in this manner and photoconductive devices were fabricated and measured. We have also made a detailed mass spectrometric study of the evaporant composition under different conditions. A model on the evaporation mechanism formulated from such information will be discussed. AXIAL AND RADIAL COMPRESSION OF ION BEAMS Final Report, 15 Jan. 1979 - 26 Feb. 1980
Shyke A. Goldstein and Paul F. Ottinger Mar. 1980 109 p refs
(Contract N00173-79-C-0420)
(AD-A083702; JAYCOR-TPD200-80-003-FR) Avail: NTIS HC A06/MF A01 CSCL 20/8

The present report concentrates on the physics of propagating intense ion beams in plasma channels. In particular, the theoretical aspects are studied of the possible effects during ion beam transport on the structure of electromagnetic fields in the plasma. The ion orbits were solved for different classes of plasma channels including bumpy ones in order to evaluate the sensitivity of beam losses due to channels that deviate from idealistic shapes. The consideration of different plasma instabilities, the hydrodynamic motion of the plasma, propagation in filamentary channels and beam energy losses put realistic limits on how much ion current can be propagated using the simple steady plasma channel concept. Axial bunching of the beam (via time dependent voltage ramping of the ion diode) was analyzed and found to be a sound concept as long as no more than an order of magnitude pulse compression is attempted. The radial compression is viable on a small scale in tapered channels (giving a factor of 2 increase in current density) and on a large scale if self magnetic fields fully penetrate the media (giving rise to an order of magnitude increase in ion beam current density). Further theoretical investigation on the details of the above mechanisms are presently in progress including new plasma channel schemes that help to push upwards the limits on the ion currents. GRA

Rapid developments in the study of oxygen reaction chemistry occurred as it is succeeded in obtaining an O(1D) beam source and commenced investigating the dynamics of several important reactions of O(3P) and O(1D). In the reaction of O(3P) with C6H6 and C6D6, two competing channels, one producing a stabilized addition complex and the other forming radical products C6H5O - H has been identified. Studies of the effects of collision energy and of deuteration were used to clarify the reaction mechanism. The reaction of O(3P) with another aromatic hydrocarbon toluene, results in competition between two substitution channels, loss of H atom and loss of CH3. In contrast to the O - C6H6 reaction, no stabilized oxygen-toluene adduct was observe. GRA

(PNL-2782) Avail: NTIS HC A05/MF A01

Geological and geohydrologic data for the Paradox Basin were used to simulate movement of ground water and radioactive contaminants from a hypothetic nuclear reactor spent fuel repository after an assumed accidental release. The pathlines, travel times and velocity of the ground water from the repository to the discharge locale (river) were determined after the disruptive event by use of a two dimensional finite difference hydrologic model. The concentration of radioactive contaminants in the ground water was, calculated along a series of flow tubes by use of a one dimensional mass transport model which takes into account convection, dispersion, contaminant/media interactions and radioactive decay. For the hypothetical site location and specific parameters used in this demonstration, it is found that Iodine-129 is the only isotope reaching the Colorado River in significant concentration. This concentration occurs about 8.0 x 10 to the 5th power years after the repository has been breached. DOE

MEASUREMENT OF STRONGLY REFRACTING, THREE-DIMENSIONAL INDEX DISTRIBUTIONS Ph.D. Thesis
Glen Walden Johnson 1980 167 p
Avail: Univ. Microfilms Order No. 8014330

Procedures for specifying a general class of optical systems were developed and incorporated into a computer program. Provisions are included for tracing rays through regions having inhomogeneous refractive indices. For this purpose, a vector form of the Runge-Kutta-Nystrom integration technique was applied. The first of two examples discusses the design of a series of lenses from a glass whose refractive index is described by an axial, Guassian distribution. The second example explores several potential sources of error in the measurement of gradient index fibers where the direction of the probing light is perpendicular to the fiber's optical axis. A homodyne, modified Mach-Zehnder interferometer was built to measure gradient index samples by probing the sample over a range of angles about the gradient direction. Two types of measurements of a gradient index lens blank, having a Gaussian index distribution, are presented. First, a wavefront map of the blank reveals imperfections in the gradient. Second, a series of measurements are made that are analyzed by simulating the test conditions. Dissert. Abstr.

OPTICAL PROPERTIES AND SOLAR SELECTIVITY OF METAL-INSULATOR COMPOSITE FILMS Ph.D. Thesis
Harold Gene Craighead 1980 192 p
Avail: Univ. Microfilms Order No. 8015657

The results of an experimental study of metal-insulator composite films are described. A description of the entire process of sample production, characterization, experimental examination and ultimate demonstration of an application is included. The problem considered was to measure the optical constants of metal insulator-composite materials and check the applicability of effective medium-composite materials and check the applicability of effective medium theories in predicting their optical properties. With this knowledge, there was also the goal of designing and fabricating efficient and durable solar photothermal absorber surfaces. The method used for controlled coevaporation of microscopically segregated metal-insulator composites is described. With this technique many different composites were produced; the most notable ones were Ni/Al2O3, Au/Al2O3, Au/MgO, Ag/MgO and Pt/Al2O3. Dissert. Abstr.

PHASE CONJUGATE OPTICS: ON THE THEORY, OBSERVATION, AND UTILIZATION OF TEMPORALLY-REVERSED WAVEFRONTS AS GENERATED VIA NONLINEAR OPTICAL PARAMETRIC INTERACTIONS Ph.D. Thesis
David Mort Pepper 1980 330 p
Avail: Univ. Microfilms Order No. 8014305

Theoretical and experimental aspects as well as potential applications in the field of coherent optics known as Phase Conjugate Optics (PCO). The ability of PCO to correct for image modal dispersion in optical waveguides as well as the use of PCO to perform real time coherent image processing and nonlinear microscopy is discussed. Temporal-frequency domain applications of PCO analyzed include the use of a nearly degenerate four-wave mixing process as a narrowband, wide field-of-view optical filter, capable of an amplified bandpass. The ability of a PCO interaction to renarrow (transform limited) optical pulses which have been temporally spread due to propagation through (group velocity) dispersive channels is analyzed. A potential application of PCO in the field of nonlinear laser spectroscopy is presented. Specifically, the scattering of a probe photon off a two-photon coherent state (created in a three-level atomic system) is shown to yield a conjugate replica. Dissert. Abstr.

In this project work, means were considered to achieve high-speed (GHz) switching and modulation in integrated optical circuits, suitable for fiber optics applications. In particular, design and performance criteria were calculated for a planar coupled optical channel device, electro-optically switched by synchronous electrical signals propagating along an asymmetric coplanar waveguide stripline. Design was also executed for several of the components in the laboratory although full integration was not completed within the project period. GRA

MANUFACTURING METHODS AND TECHNOLOGY PROGRAM FOR RUGGEDIZED TACTICAL FIBER OPTIC CABLE Quarterly Progress Report, 1 Jul. - 30 Sep. 1979
R. Hoss and L. Ptaschek 26 Oct. 1979 86 p refs
(Contract DAAK80-79-C-0789)
(AD-A084191; CORADCOM-79-0789-1; QPR-1) Avail: NTIS HC A05/MF A01 CSCL 20/6

This report covers the first quarter of the Manufacturing Methods and Technology Program for Ruggedized Tactical Fiber Optic Cable. The scope of this quarter's effort, as reported herein, includes the following tasks and achievements: (1) cable process optimization: selection and ordering of polyurethanes for cable jackets, and fabrication and optical testing of the first engineering sample; (2) facilitization: high speed strander setup and operation, extruder setup, and fiber optic measurement station design; and (3) secondary performance milestones: 1st sample cable induced attenuation measurements. In addition to reporting progress on these milestones the report covers any revisions or improvements in process, equipment, tooling manufacturing flow and specifications. Key personnel on the program are identified. The program milestones for the next quarter are listed. GRA

MHD CHANNEL FLOW AND HEAT TRANSFER IN A TIME-DEPENDENT SPATIALLY VARYING MAGNETIC FIELD Ph.D. Thesis
Subramani Rajaram 1980 282 p
Avail: Univ. Microfilms Order No. 8016238

The problem of fluid flow and heat transfer in the entrance region of a parallel plate channel under the influence of a magnetic field was studied. The magnetic field is not restricted to be steady and uniform but could be nonuniform or time-dependent and arbitrarily inclined to the channel axis. In addition, the wall conductivity is arbitrary. The problem is formulated in a way for the magnetic induction equation so that it is similar to the vorticity transport equation. Boundary layer simplications were not made and the complete Navier-Stokes equations were considered. The formulation of the problem enables all of the equations to be written in a single form. The heat transfer problem was classified into the constant wall temperature and constant wall heat flux problems. The complete energy equation with volumetric heat generation is considered. The problem has been solved for the case where velocity is already fully developed as temperature starts developing and for the simultaneous development of velocity and temperature. The effect of increasing the magnetic field is to enhance heat transfer. The problem is studied for a uniform and inclined field. The effect of increasing the inclination of the field is also to increase heat transfer at the walls due to a flattening of the velocity profiles. This effect is predominant for higher Peclet and Prandtl numbers. Dissert. Abstr.

N80-28184 California Univ., Los Angeles.
EXPERIMENTAL INVESTIGATION OF THE ANOMALOUS SKIN EFFECT AND COMPUTER SIMULATION OF THE COLLISIONLESS INTERCHANGE INSTABILITY Ph.D. Thesis
Heinz Goede 1980 188 p
Avail: Univ. Microfilms Order No. 8015979

The penetration of low frequency (omega << omega sub pe) electromagnetic waves into a uniform, collisionless, gaseous plasma is experimentally investigated. Measurements of the radial spatial decay of the oscillating magnetic field are used to obtain values of the skin depth. For fixed plasma density and temperature, field penetration is observed to remain constant until the frequency of the electromagnetic wave is low enough for electron thermal effects to become important. The enhanced penetration that occurs at this point is attributed to the well known anomalous skin effect that has been measured in solid state plasmas. In addition, a computer simulation study of the interchange instability in a two-dimensional, collisionless, zero-beta plasma is presented. Of particular interest is to examine whether compressional effects of a plasma immersed in an inhomogeneous magnetic field can lead to the stabilization of the interchange mode for parallel plasma pressure and magnetic field gradients as predicted by ideal magnetohydrodynamic theory. The simulation results indicate that, while stable states with plasma density and magnetic field gradients in the same direction exist, the fluid stability condition is not an optimistic one. Dissert. Abstr.

N80-28185 Cornell Univ., Ithaca, N. Y.
THE EQUILIBRIUM AND COMPRESSION OF ION RINGS Ph.D. Thesis
David Allan Larrabee 1980 251 p
Avail: Univ. Microfilms Order No. 8015698

The equilibrium properties of ion rings and their behavior during compression is discussed. The equations describing nonrelativistic ion rings are discussed in general terms. A commonly used model for ring equilibria, the exponential rigid rotor, is examined in detail numerically. It is concluded that this model does not adequately describe the expected equilibrium in reactor-type systems where the aspect ratio of the rings is small, (e.e., the ring is fat) due to the presence of untrapped particles. This is shown numerically by comparing this model with a model of the same form but without the untrapped particles. Dissert. Abstr.

N80-28186 California Univ., Berkeley.
INSTABILITIES OF A MAGNETIZED PLASMA DRIVEN BY A VELOCITY RING OR A DENSITY GRADIENT Ph.D. Thesis
Jae Koo Lee 1979 149 p
Avail: Univ. Microfilms Order No. 8014774

The interaction of magnetized monoenergetic ions (a ring in velocity space) with a homogeneous Maxwellian target plasma is studied. Numerical studies using linear Vlasov theory and the results of computer simulations are presented. The velocity-ring-driven instability is classified into three distinct regimes based on the beam density relative to the plasma density relative to the plasma density, where physical mechanisms, dispersion diagrams and maximum growth rates are quite different, adding

to previously known results. The ring-plasma instability is studied through electrostatic and electromagnetic simulations, treating the ring ions as particles and the target plasma (ions and electrons) as linearized fluids. Simulation results follow very closely the predictions of the linear Vlasov theory and provide extensive information on nonlinear features such as beam spreading, slowing down, and saturation, some of which are in agreement with analytic explanations. Dissert. Abstr.

N80-28187 California Univ., Berkeley.
A STUDY OF THE GENERAL PLASMA CHARACTERISTICS OF A HIGH POWER, MULTIFILAMENT ION SOURCE Ph.D. Thesis
Kurt Francis Schoenberg 1979 137 p
Avail: Univ. Microfilms Order No. 8014871

Results of steady state measurements, obtained via a pulsed electrostatic probe data acquisition system, and fluctuation measurements, obtained via a broadband digital spectral analysis system, are presented. It is concluded that: (1) source electron distribution function consists of a bulk component of thermalized electrons comprising 90% to 97% of the total electron population, plus a nonthermal high energy tail which is a monotonically significant electron population at energy values 10 to 15 eV above maximum cathode fall; (2) source plasma fluctuations are caused by ion acoustic waves, initially excited by a current driven instability at the thermionic cathode; and (3) fluctuation spectral energy density is highly nonthermal and exhibits a resonant profile set by the periodic multifilament structure in the source plasma chamber, indicating an interaction between filaments and the ion waves. Dissert. Abstr.

N80-28188 California Univ., Berkeley.
EQUILIBRIUM AND STABILITY IN STRONGLY INHOMOGENEOUS PLASMAS Ph.D. Thesis
Harry Elliot Mynick 1979 222 p
Avail: Univ. Microfilms Order No. 8014826

In some confinement schemes of current interest, for example in conventional and field-reversed mirrors, and in the Tormac sheath, the parameter eta, defined as the ratio of ion gyroradius to the plasma scale length perpendicular to the magnetic field, may take on appreciable values, as large as 1/3. Formalisms appropriate to the study of such strongly inhomogeneous plasmas are developed and applied, for three general aspects of plasma behavior. Each of these three topics is studied using Hamiltonian formalism, which greatly aids in expressing results in a general and concise manner. The formalism is phrased in terms of variational principle which, in addition to serving as a labor-saving device in parameter regimes where use of a finite-order differential equation is an adequate approximation to the full nonlocal mode equation, also permits the derivation of valid dispersion equations when the problem is fully nonlocal in character. Dissert. Abstr.

N80-28189 Cornell Univ., Ithaca, N. Y.
PRODUCTION AND INVESTIGATION OF A MULTI-AMPHERE POSITRON SOURCE Ph.D. Thesis
Gerald Louis Ferrentino 1980 141 p
Avail: Univ. Microfilms Order No. 8015671

The influence of collective effects on the generation and acceleration of positrons at high current densities is examined and a plasma diagnostic method is demonstrated from an appropriately designed multi-ampere positron source. The source developed has a known energy and angular spread, with a current density of several amperes per square centimeter. A positron current of approximately 15 amperes was produced by bombarding a tantalum target with a pulsed intense relativistic electron beam (IREB). The measured electron-to-positron-conversion yield agreed quantitatively with published low-current values. In a second experiment, the collective acceleration of positrons was investigated by installing a special target assembly that allowed a portion of the unneutralized IREB into air (P approximately less than 100 millitorr) in the vicinity of the positrons. Substantial changes in the positron-energy spectrum and a 60-fold increase of positron signal were observed. Discussions of pair-production, experimental apparatus, and beam-plasma interactions are included. Dissert. Abstr.

N80-28190 California Univ., Berkeley.
NONLINEAR WAVE EVOLUATION IN VLASOV PLASMA. A LIE TRANSFORM Ph.D. Thesis
John Robert Cary 1979 291 p
Avail: Univ. Microfilms Order No. 8014628

Nonlinear wave evolution in Vlasov plasma is analyzed using the Lie transform, a powerful mathematical tool which is applicable to Hamiltonian systems. A useful relation between the ponderomotive Hamiltonian (the kinetic generalization of the ponderomotive potential) and the linear susceptibility of Vlasov plasma, a general formula for the second order, self consistent quasistatic density perturbation produced by a wave packet. For a plasma with one species of single charged ions this formula includes kinetic effects and applies to both magnetized and unmagnetized plasma. Lie transform theory is then applied to two problems, the first of which is to find the nonlinear wave equation that governs waves in unmagnetized plasma. The calculation shows that the self Faraday rotation effect is comparable to the self precession effect. This fact implies that a measurement of the polarization rotation acquired by a nonlinear electromagnetic wave in passing through a plasma does not determine the self-generated quasistatic magnetic field. The second problem considered is the propagation of a test wave in the system consisting of a plasma and a large amplitude electromagnetic wave. Dissert. Abstr.

REFLECTION OF OBLIQUE ELECTRON THERMAL MODES IN AN INHOMOGENOUS PLASMA
T. Ohnuma (Tohoku Univ.), T. Watanabe (Hiroshima Univ.), and H. Sanuki Apr. 1980 12 p refs
(IPPJ-457) Avail: NTIS HC A02/MF A01

In an inhomogeneous magnetoplasma, reflection of an oblique electron thermal mode radiated from a local source is investigated experimentally and theoretically near the electron plasma frequency layer. The experimental observation of reflection in the lower plasma density region rather than the electron plasma frequency layer is found to be in qualitative accord with the theoretical reflection, which is obtained from a kinetic theory in an inhomogeneous magnetoplasma. The reflection of the thermal mode is also compared with that of an electromagnetic mode at the electron plasma frequency layer. Author

COMPARATIVE STUDY OF ENERGY ACCOUNTING FOR HEAVY ION FUSION WITH VARIOUS DRIVER ACCELERATORS
S. Kawasaki (Kanazawa Univ.) and A. Miyahara. Apr. 1980. 18 p. refs.
(IPPJ-454) Avail: NTIS. HC A02/MF A01.

Typical designs of driver heavy ion accelerator systems are compared with regard to their 'energy payback time' versus 'cost of construction'. The detailed analyses show that the energy investment for the construction of the Heavy Ion Fusion power station is somewhat smaller than the energy produced by the station in its lifetime, in spite of the large scale of its hardware. The situation could be more favorable than, or at least comparable with, the case of magnetically confined fusion. L.F.M.

SURFACE STUDY OF FUSION RESEARCH IN UNIVERSITIES LINKAGE ORGANIZATION
Akira Miyahara. Apr. 1980. 41 p. refs. Presented at the Japan-US Joint Seminar Mater. Res. Effects in the Fusion Environ., Argonne, Ill., 7-10 Jan. 1980.
(IPPJ-455) Avail: NTIS. HC A03/MF A01.

Progress in surface studies for the nuclear fusion research is reported emphasizing studies on the surface process and the surface damage. In the case of the surface process studies, recycling of hydrogen isotopes, desorption of gaseous light impurities, sputtering, blistering, arcing, and other surface processes are main concerns. On the other hand, for the surface damage studies, the problems are defined by the conceptual fusion reactor design study. These are classifications of the damage mechanism, the superposition of multiple damage effects, the study of modified surfaces produced by plasma irradiation and the surface erosion rate. J.M.S.

HEAT TRANSPORT DUE TO THE COLLISIONLESS TEARING INSTABILITIES
I. Katanuma. May 1980. 36 p. refs.
(IPPJ-461) Avail: NTIS. HC A03/MF A01.

Collisionless tearing instabilities and the associated electron heat transport are investigated by using a two-and-one-half dimensional particle simulation code. It is shown that a collisionless drift tearing instability saturates at a low amplitude and turns into a nonlinear pure tearing instability. The electron internal energy profile is flattened within the magnetic island. The electron heat conductivity obtained from the heat flow across the singular surface is proportional to W(4) in the linear phase and to (dW/dt)W squared in the nonlinear phase of the tearing instability. Here W is the half width of the magnetic island. A theoretical model to explain these results is also presented. Author

ACCURATE ANALYTIC APPROXIMATIONS AND NUMERICAL SOLUTIONS FOR THE STRUCTURE OF QUASI-STATIC LASER DRIVEN ABLATION LAYERS
Joseph H. Orens. 29 Feb. 1980. 23 p. refs. Sponsored in part by DOE.
(AD-A083913; NRL-MR-4167) Avail: NTIS. HC A02/MF A01. CSCL 20/9.

Time dependent simulations of a laser driven accelerating shell and ablation layer have shown the presence of long lived quasi-static density and pressure profiles. This paper models the equilibrium solutions for a laser ablation layer both analytically and numerically and develops a detailed understanding of the nature of this flow. Such a model enables the calculation of the quantitative dependence of the shell thickness and acceleration, the peak density, velocity, and temperature of the shell, the width of the Rayleigh-Taylor region, and the distance to the critical surface on the total plasma mass, the critical density, and the absorbed and reflected laser flow. A compound X-ray imaging device is being developed as an aid in the diagnostics of the laser fusion implosion process which involves a pellet of the order of 100 microns in diameter. Ideally, both temporal and spacial information is being sought. This report deals mainly with the removal of spherical aberration from a single X-ray optical element by means of a surface figure which is described by a polynomial of third order and higher. Such an X-ray focuSing element would be useful in an X-ray Streak camera for obtaining temporal information. Combinations of other higher-order surfaces and aperture stops will be used in a compound imaging-device in the attainment of spacial information with sub-micron resolution. Attention is given to the generation and testing of such high-order surfaces. A specially designed surface generator and lapping machine is described. GRA

PULSED NMR AND ZERO SOUND MEASUREMENTS IN SUPERFLUID HELIUM-THREE Ph.D. Thesis
Russell Whitney Giannetta 1979 136 p
Avail: Univ. Microfilms Order No. 8015672

Pulsed nuclear magnetic resonance experiments were performed in the A and B phases of superfluid 3He, at pressures of 23 and 27 Bar. Measurements of H3-B spin susceptibility, He3-A dipole frequency, and nonlinear frequency shifts in both phases all agree well with previous measurements. Additional, unexplained spin motions in H3-B were also observed. Spin relaxation studies are consistent with those of Corrucini and Osheroff and Webb in He3-A, but differ considerably in H3-B. Using large angle RF pulses, anomalous frequency shifts were observed, whose persistence indicated new, metastable resonances in He3-A. The measurements are in excellent agreement with those of Bozler et. al. The soliton lattice model of Bruinsma and Maki is discussed and compared with the experimental results. In most respects, the model accurately fits the data. Preliminary results of zero sound measurements in H3-B are also discussed. At low pressures, evidence is presented for a separation of pair-breaking and collective mode contributions to 10 MHz zero sound attenuation. Moreover, the oscillations in attenuation with temperature, first observed by Paulson and Wheatley were observed. Finally, measurements of sound attenuation and velocity at 50 MHz revealed unexpected structure as a function of temperature. Dissert. Abstr.

EXPERIMENTAL STUDIES OF EXCITED METALLIC PHASES IN STRESSED GERMANIUM Ph.D. Thesis
John Elson Furneaux 1979 156 p
Avail: Univ. Microfilms Order No. 8014689

Various experimental aspects of the strain-confined electron hole liquid (SCEHL),which forms when photoexcited carriers flow into a strain potential well created by suitably inhomogeneously stressing Ge, are discussed. The formation process for the SCEHL was examined by time-resolved Alfven wave resonance experiments. The distortion of the SCEHL by a static magnetic field was discovered and studied. Simultaneous infrared imaging and Alfven wave resonance experiments led to the discovery of this magnetostriction of the SCEHL. Further studies using an infrared vidicon and an image scanning apparatus demonstrated that the magnetostriction is caused by the recombination current which is necessary to keep the SCEHL at a constant density even though electron hole pairs within it recombine. The externally applied magnetic field deflects these currents causing an induced magnetic moment and a magnetic contribution to the energy. The total energy of the SCEHL is then minimized by a distortion of the liquid drop usually into an oblate spheroidal shape about the magnetic axis. In addition, the de Haas-van Alfven like magneto-oscillatory luminescence and the equilibrium properties of SCEHL were studied. Dissert. Abst.

David Robert Denley 1979 171 p
Avail: Univ. Microfilms Order No. 8014650

The absorption in the extended region of the spectra (EXAFS) is discussed as a technique for structural analysis for: the L sub 2, 3 edge in Ti, the K-edge in microcrystalline, polycrystalline, and monochromator graphite; and the fluorine K-edge of the polymer polyvinylidene fluoride PVF sub 2). The first experiment to use photoyield spectroscopy for an EXAFS structural analysis from a surface is discussed for a surface of oxidized aluminum. The near threshold absorption spectra for the Ti L-edges, the Ag M sub 4, 5, the graphite C K-edge, and the C K-edge in PVF sub 2 are discussed with respect to their electronic structure. An attempt to show that the absorption is paralleled in the symmetry allowed component of the empty density of states is fairly successful. Additional complications are found to arise from atomic like matrix element effects, large variations in the hole lifetime, and excitonic effects. Examples from the L-edge photoyield of Fe and Cu are also considered. The electronic structure analysis of surfaces and interfaces is discussed using the system GaAs/Ge. Dissert. Abstr.

TUNABLE FAR-INFRARED RADIATION GENERATED BY A JOSEPHSON JUNCTION Ph.D. Thesis
Richard Keith Elsley 1977 173 p
Avail: Univ. Microfilms Order No. 8015770

Point contact Josephson junctions were used to generate tunable monochromatic far infrared radiation. The radiation is found to be monochromatic to within the ability to resolve (0.07/cm) and tunable from 2/cm to at least 20/cm and possibly 50/cm. The junctions are in the form of a point contact between two pieces of niobium foil. The foil surfaces guide the radiation away from the contact in a relatively non-resonant manner, allowing the frequency to be tuned merely by varying the DC voltage applied to the junction. The radiation was frequency analyzed using a far infrared interferometer and the radiation's linewidth was resolved. Transmission spectroscopy using the junction source was performed on absorption lines in solids at frequencies from 8/cm to 20/cm and the results compared to measurements made by other means. The performance of the junction source was compared to an equivalent circuit model which predicts power output, linewidth, and harmonic content of the radiation. Dissert. Abstr.

THE PHASE DIAGRAM AND MAGNETIZATION OF SUPER FLUID 3HE Ph.D. Thesis
Jan David Feder 1980 193 p
Avail: Univ. Microfilms Order No. 8015875

The procedure and results of a series of experiments designed to measure the phase boundaries and the magnetization of the superfluid phases of (3)He are described. Measurements were performed at five pressures below the polycritical pressure of 21.5 bar. Magnetization data were obtained from continuous wave nuclear magnetic resonance spectra by integrating the absorption signals. Phase boundaries were determined from the magnetization discontinuities induced by the phase transitions. The magnetization results were found to be in close agreement with the predictions of Bardeed-Cooper-Schrieffer theory suitably-corrected for Fermi liquid effects except at the lowest pressures (0 and 3 bar), where the data indicate a non linear magnetization vs. field relation. The data were reduced to yield the latent heat at the A - B transition, the molar volume difference in the two superfluid phases, and the zero field difference in the Gibbs potentials of the two phases. The Gibbs potential difference were extrapolated to the T approaches T sub c limit to extract the zero field difference in the specific heats of the A and B phases at T sub c. The specific heat results were compared with the predictions of weak coupling theory, and with two strong coupling theories. Dissert. Abstr.

A MONTE CARLO STUDY OF CRYSTALLIZATION AND CRYSTALLINE ORDER IN SIMPLE TWO-DIMENSIONAL SYSTEMS Ph.D. Thesis
Robert Charles Gann 1979 150 p
Avail: Univ. Microfilms Order No. 8015773

Monte Carlo simulation, lattice dynamics in the harmonic approximation, and solution of the hypernetted chain integral equation were used to study the classical, two dimensional, one component plasma. The solid phase shows directional long-range order. In the solid phase, positional long-range order is lost as

the thermodynamic limit is approached. The results of the calculation of the thermodynamic functions and the one and two particle distribution functions are presented. The results are compared to the system of particles interacting via an inverse twelfth-power potential. Dissert. Abstr.

DYNAMICAL SYMMETRY BREAKING IN LATTICE GAUGE THEORIES Ph.D. Thesis
Benjamin Svetitsky 1980 97 p
Avail: Univ. Microfilms Order No. 8015408

Dynamical breaking of chiral symmetry in quantum chromodynamics defined on a spatial lattice is investigated. The formulation respects chiral symmetry by employing a long range gradient for the fermion field. In the strong-coupling limit all states with non zero electric flux are at very high energy, so that the set of degenerate ground states is comprised of all fermionic configurations which are color singlets site by site. An effective Hamiltonian is derived for the 'mesons' in perturbation theory about this limit. Color and flavor are shown to be inessential and the U(1) guage theory is considered with one flavor of four component fermions. The effective Hamiltonian is that of an antiferromagnet whose symmetry group is determined by the dimensionality of space. It is shown that if all but nearest neighbor interactions is dropped the resulting SU(4) antiferromagnet realizes some or all of its symmetry generators in Nambu-Goldstone mode. It is hypothesized that this physics survives when one breaks the SU(4) with non nearest neighbor terms, and this is checked for the one dimensional theory with an explicit block-spin calculation. Dissert. Abstr.

ELECTRON SPECTROSCOPY STUDIES OF CLEAN OXIDE SURFACES, CHEMISORBED MOLECULES AND PHOTO-ASSISTED SURFACE PROCESSES Ph.D. Thesis
Wei Jen Lo 1979 210 p
Avail: Univ. Microfilms Order No. 8014781

Various surface analytic techniques were used to characterize the surface properties of TiO2 and SrTiO3. The chemisorption of molecules on these surfaces and the photo-induced effects on the adsorbed molecules were also examined. Surface chemical composition, electronic properties, and concentration of Ti(3) ions as well as the dissociation of water into hydrogen and oxygen at the solid-gas interface were among the topics studied. Dissert. Abstr.

N80-28212 California Univ., Berkeley.
ELECTRONS ON THE SURFACE OF LIQUID HELIUM Ph.D. Thesis
David Kay Lambert 1979 118 p
Avail: Univ. Microfilms Order No. 8014769

Spectroscopic techniques were used to study transitions of electrons between bound states in the potential well near a helium surface. The charge density distribution of electrons on the surface was independently obtained from electrical measurements. The interaction of the bound state electrons with the surface of liquid helium and local disorder in the positions of electrons on the surface were examined. Results indicate that the distribution of charge on the helium surface is appreciable only within a 'charge pool' that does not in general cover the entire surface and that the distribution of charge in the charge pool can be obtained from electrostatics. Dissert. Abstr.

X-RAY ABSORPTION STUDIES OF GRAPHITE INTERCALATES AND METAL-AMMONIA SOLUTIONS Ph.D. Thesis
Alan Spence Robertson 1979 245 p
Avail: Univ. Microfilms Order No. 8014858

The features in the region near the onset of the K-shell absorption edge, which has been termed X-Ray Absorption Edge Spectroscopy (XAES), are transitions into the unoccupied molecular orbitals or metallic bands of the element being studied. On the high energy side of the absorption edge, the oscillatory portion of the absorption coefficient, which has been labelled Extended X-Ray Absorption Fine Structure (EXAFS), can be analyzed to provide a local radial distribution function around the element being studied. The As-F distances obtained for AsF3 and AsF5 gas are both in excellent agreement with electron diffraction data (within 0.004 A). A superior measurement which is significantly shorter than the accepted value of the bond distance in an undistorted AsF6-octahedra is reported. Both the XAES and EXAFS data presented support the hypothesis that the AsF5 oxidizes graphite upon intercalation to produce AsF6-and AsF3 intercalant species. Changes in the Rb K-edge features which are consistent with the known properties of Rb-NH3 are correlated with conductivity and delocalization of the solvated electons. In the XAES region, the Rb-N bond distance and the relative number of nitrogen atoms in the first shell are measured. Dissert. Abstr.

N80-28214 California Univ., Berkeley.
SUPERCONDUCTOR INSULATOR SUPERCONDUCTOR QUASIPARTICLE TUNNEL JUNCTIONS AS MICROWAVE RECEIVERS Ph.D. Thesis
Tek-Ming Shen 1979 107 p
Avail: Univ. Microfilms Order No. 8014875

The rapid onset of quasiparticle tunneling current in superconductor insulator-superconductor junctions at voltages above 2 delta/e, used for millimeter wave heterodyne mixing is discussed. Junctions with 2 micron diameter and R sub N = 50 omega have little capacitive shunting at the signal frequency of 36 GHz. Because there is no series resistance, residual capacitance can be tuned out. Single sideband conversion efficiencies of 0.16 and mixer noise temperatures as low as T sub M < or = 14K = 8h nu/k have been observed. The results are compared with shot noise limited mixer theory. Photon assisted tunneling effects are seen which indicate the approach to photon noise-limited operation. The quantum theory of mixing is reviewed and an intuitive picture illustrating the physical significance of the quantum theory is presented. The experimental results are in good agreement with computer simulations using shot noise limited quantum theory. The theoretical model an ideal switch mixer has been experimentally explored and its mixing performance in the quantum limit is investigated. Fundamental limits of a heterodyne mixer using tunneling devices and possible future developments are discussed. Dissert. Abstr.

PROPERTIES OF SUPERCONDUCTOR-NORMAL METAL-SUPERCONDUCTOR MICROBRIDGES Ph.D. Thesis
John Michael Warlaumont 1980 174 p
Avail: Univ. Microfilms Order No. 8015749

The fabrication and electrical measurement of short, high resistance (R is approximately 1 ohm) superconductor-normal metal-superconductor microbridges is described. The small (length and width as small as 200 nm), planar structures were produced using electron beam lithography and ion beam etching. Lead-copper-lead structures were primarily studied; other materials were also briefly investigated. The small cross section of the bridges resulted in a uniform current distribution in the bridges at all temperatures, thus enabling the experimental determination of the critical current versus temperature relation for all temperatures between T sub c and 0.05 T sub c, where T sub c is the transition temperature of the electrodes. This experimental I sub c (t) relation was found to agree with theoretical predictions based on Usadel's equations. This successful fit of theory to experiment produced a reduced length, l, for each sample; the sample had reduced lengths ranging from 8.2 to 30. The low-voltage current-voltage (I-V) characteristics were studied in detail. It was found that these I-V curves could be characterized by a temperature independent relaxation time tau sub eff; this relaxation time was observed to be proportional to l(2). Dissert. Abstr.

THE DETERMINATION OF ELECTRONIC STATES IN CRYSTALLINE SEMICONDUCTORS AND METALS BY ANGLE-RESOLVED PHOTOEMISSION Ph.D. Thesis
Kenneth Alan Mills 1979 149 p
Avail: Univ. Microfilms Order No. 8014810

Angle-resolved photoemission (ARP) spectroscopy for the detailed experimental investigation of band structures, and its application to both semiconducting and metallic single crystals is examined. Attention is focussed primarily on the actual electromagnetic excitation process; both direct and indirect

transitions are discussed, as are final-state dependent effects, and the influence of parameters such as radiative polarization temperature, sampling depth, and experimental geometry. Variable photon energy spectra are used to map conduction bands for the sigma and sigma' directions in GaAs, and the results are compared with theory. As concerns crystalline metals, the (111) fade of Au and Pt, and the (100) and (110) faces of Ag, are studied in detail using high-resolution variable photon energy ARP. Special attention is paid to final-state-induced spectral features, and consideration of both the energy and intensity behavior of such features leads to the construction of a simple physical picture which both explains the observed phenomena and provides a justification for the use of a quasi-free-electron final state dispersion. Dissert. Abstr.

SURFACE PROPERTIES OF ANTIFERROMAGNETIC METALS AND ALLOYS Ph.D. Thesis
Gustavo Jose Mata 1979 61 p
Avail: Univ. Microfilms Order No. 8014799

Some aspects of the surface properties of antiferromagnetic metals are examined which exhibit a periodic variation of the electronic spin density (a spin-density wave). In particular, the possibility that a spin-density wave might exist at the surface of an otherwise paramagnetic metal is addressed. A phenomenological theory is developed to describe the behavior of the amplitude of a spin-density wave (order parameter) when the electron-electron interaction is enhanced in the immediate vicinity of the surface. The free energy of the system under consideration is taken to be a local functional of the order parameter. The analysis shows that for a range of the parameters in the free energy functional, spin-density waves may appear at the surface and decay into a paramagnetic bulk. The parameters of the phenomenological theory are explicitly calculated for a model system and expressions are obtained which involve its microscopic properties. With the help of these expressions the theory is applied to chromium and the chromium-rhenium alloys. Results suggest that surface spin-density waves may exist in these materials at temperatures above the transition temperature corresponding to the bulk. Dissert. Abstr.

INTERACTIONS IN SOLIDS Ph.D. Thesis
Andrei Manoliu 1979 62 p
Avail: Univ. Microfilms Order No. 8014795

The attractive interaction between a magnetic monopole and a ferromagnetic domain was calculated. The complete calculation which includes effects of anisotropy and exchange, gives a result for the interaction energy (referred to the pole at infinity) which is ten percent lower than that obtained by the methods of images. A monopole of unit charge, g = (137/2)e, is found to be attracted by iron, and the interaction energy is about 50 meV. The interaction between phonons and the carriers in the electron-hole drop formed in germanium by optical pumping is discussed. This interaction accounts for the slowing force on the drops in the cloud in their motion to the point of maximum stress in inhomogeneously stressed samples of germanium. The interaction between the large drop, formed in inhomogeneously stressed germanium, and microwave radiation was calculated. It is shown that under steady microwave pumping and steady state illumination the drop heats up above its critical temperature releasing carriers into the crystal. Dissert. Abstr.

ENERGY TRANSPORT IN HARMONIC LATTICES Ph.D. Thesis
Stephen Landers Linn 1979 64 p
Avail: Univ. Microfilms Order No. 8014174

One and two dimensional oscillator systems are constructed so that individual oscillators are bound to their home positions and coupled to nearest neighbors by linear forces; both systems are treated for the case of weak coupling. The two dimensional system has a tensor binding force that does not permit it to be decoupled into two noninteracting sytems. Segments and strips are treated as thermodynamic systems in contact with a heat bath and Gaussian initial probability densities are used to compute correlations. Expressions for entropy and temperature are computed by relating initial system and bath variances to equilibrium temperature. Asymptotic relations for 'temperature' are found that show the degree of coupling between dimensions affects the rate of approach to equilibrium, but only through the coefficient of time and not its power. Both systems approach equilibrium as +/-1 rather than +/-1/2 as predicted by continuum theory. Dissert. Abstr.

HC A03/MF A01 CSCL 20/12

The goal of the proposed research was to study surface states at GaAs metal Schottky barrier junctions and the effects of oxygen exposure on the surface states using both optical and electrical measurements with the goal of correlating the optical and electrical results. The correlation could not be achieved because the optical measurements were unsuccessful in detecting the surface states. From the electrical measurements, the following results were obtained: oxygen-exposure before the metallization with Al produces a large increase in the surface density of states peaking about 0.28 eV above the Fermi level; Al-GaAs diodes metallized without oxygen exposure had ideality factors of n equal to less than 1.1; Ag-GaAs diodes with oxygen exposure also show a surface state density peaking about 0.3 eV above the Fermi level. However, the surface state density is considerably lower than for oxygen-exposed AlGaAs diodes; Au-GaAs diodes with oxygen exposure show a surface state density which peaks about 0.45 eV above the Fermi level. Again, this density is considerably lower; from the above, oxygen at a GaAs-metal interface plays an important role in determining the surface state density. The theoretical part of this study to calculate electronic energies at GaAs surface was also unsuccessful. GRA

Thin film ultrasonic detectors have been fabricated from amorphous germanium. The detectors are insensitive to phase and function as sensitive power detectors for ultrasonic waves. Due to the mode of operation of the detectors, their usefulness is limited to the temperature range 1.5 - 77 K. The dependence of the sensitivity of the devices upon the structural and electrical characteristics of the a-Ge material has been investigated experimentally. It was found that useful performance is obtained only when electrical conduction is by a variable range hopping mechanism. GRA

A FIBER BUNDLE APPROACH TO UNIFIED FIELD THEORY Ph.D. Thesis
Lawrence Michael Beyl 1979 121 p
Avail: Univ. Microfilms Order No. 8015428

It is shown that the Einstein, Maxwell, and Dirac equations are special cases of a fiber-bundle approach to unified field theory when based on the gauge transformations of the group SU(4/N). This group is rearranged into a modified SU(2,2/N) group which directly contains Dirac generators in the supersymmetry or Femi part, and is shown to contain the direct product, of SU(2,2) and SU(N) and U(1) in its commuting or Bose part. The action is constructed based on the curvature of the fiber-bundle and is invariant, under space-time coordinate changes and gauge transformations, when integrated over spacetime and group space. A finite change in the gauge, potentials allows the lower spin 0 and spin 1/2 components to enter. Minor changes in the theory allows different chiral contributions to occur in the Dirac equation, favoring left or right handed interactions. No restrictions are given which determine this relationship, but a choice is made to demonstrate the presence of the Dirac equation. The scaling requirements on the electromagnetic and Dirac actions fixes the size of the contribution from the Weyl action for gravity. It is found to be approximately 10 to the 65th power weaker than Einstein's gravitational action and therefore this approach avoids the problems associated with the R + R(2) Lagrangian. Dissert. Abstr.

PHASE EQUILIBRIUM OF LIGHT GASES AND HEAVY HYDROCARBONS AT ELEVATED TEMPERATURES AND PRESSURES Ph.D. Thesis
James John Simnick 1979 352 p
Avail: Univ. Microfilms Order No. 8015518

A flow type vapor-liquid equilibrium (VL) apparatus was constructed which enabled measurements to be taken at conditions up to 400 C and 250 atm. Hydrocarbon superambient vapor pressures, binary mixture VLE of light gases with hydrocarbons, and ternary mixture VLE were measured. An augmented hard core equation of state, named the BACK equation, was developed to model the phase behavior of such systems. The BACK equation is efficient in that only three constants are required for most pure fluid behavior description. These constants reflect the hard core volume, interaction energy, and shape of a molecule. Extension to modeling mixture behavior with the BACK equation was made upon introducing mixing rules for the three pure fluid constants. Van der Waals type rules employing one binary energy interaction parameter were determined to be the best precipition. An additional binary hard core volume interaction parameter was found to be necessary for mixtures containing hydrogen. Using the VLE data from this research and from the literature, these parameters were determined for a large number of binary mixtures containing hydrocarbons with methane, carbon dioxide, hydrogen sulfide, or hydrogen. Dissert. Abstr.

A MATHEMATICAL STUDY OF THE NON-RELATIVISTIC LIMIT IN QUANTUM MECHANICS Ph.D. Thesis
Ross Joseph Cirincione 1979 62 p
Avail: Univ. Microfilms Order No. 8014637

Many articles on the nonrelativistic limit in quantum mechanics have been concerned with the convergence of the Dirac equation itself to the Schrodinger (Pauli) equation as c, the speed of light, tends to infinity. The convergence of the solution of the Dirac equation is rigorously analyzed in terms of semi-groups and spectral projections. An abstract Dirac equation with relatively bounded potentials is presented and the convergence of its solution is determined with the aid of a generalization of the Trotter-Kato theorem. Similar results are determined for the convergence of the solution of the Klein-Gordon equation and for an abstract version of this equation. Dissert. Abstr.

HC A02/MF A01 CSCL 05/1

A scenario is described which involves ill-defined elements of conflict and cooperation: the acquisition of military systems by the Department of Defense (DoD) from large corporations. Current practices lead to situations in which DoD must deal with a sole source and thus forego savings which might be realized from competition between contractors. In order to deal with this situation, the Armed Services Procurement Regulations (ASPR) prescribes procedures which must be employed in the analysis and negotiation of sole source price proposals. These time-consuming procedures generate enormous proposal backlogs for government price analysts who, because of time pressure, may not be able to do a sufficiently thorough and accurate analysis upon which to base their negotiation position. This analysis paralysis also causes payment delays which, in turn, force contractors to borrow working capital and suffer capital costs. It is clearly in the best interests of all parties to expedite the processing of these proposals. This has been accomplished by developing statistical sampling and estimation techniques which, unlike some classical procedures, are not vulnerable to exploitation through the use of clever padding strategies. APPLYING BEHAVIORAL ABSTRACTION TO INFORMATION SYSTEM DESIGN AND INTEGRITY Ph.D. Thesis
Nancy Gail Leveson 1980 152 p
Avail: Univ. Microfilms Order No. 8016007

The practicality and usefulness of defining information systems using behavioral abstraction is explored. The meaning or semantics of the data is defined in the manner of an abstract data type, that is, by the definition of the operations on objects. Preserving the integrity, or correctness, of an object is defined preserving its abstract invariant. Thus specifying integrity involves both specifying the abstract invariant (the static characteristics) and the legal operations specified by pre and post conditions (the behavioral characteristics) which preserve this invariant. A method for verifying the integrity specification of an information system by proving that the abstract operations preserve the invariant and a practical means for enforcing integrity lead naturally from the integrity specification technique. It can be proved that the implementations of the operations are correct with respect to the abstraction, inserting assertions into the implementations when necessary for run-time checking. A well-structured, disciplined methodology, for information system design which supports the use of such techniques as top-down design, information hiding, and code sharing is presented along with the formal specification method. Dissert. Abstr.

SECURITY IN DATA BASE MANAGEMENT SYSTEMS Ph.D. Thesis
Deborah Downs 1980 229 p
Avail: Univ. Microfilms Order No. 8015964

Several proposed methods of supplying security in data base management systems (DBMS) are examined and conclusions are drawn concerning their suitability. A design for a certifiable, value independent, data secure, DBMS kernel is described. The DBMS kernel supports data security by identifying the data correctly at the domain level and providing a certifiable direct mapping from the logical name of the data (used in the protection data and the user's request) to the physical identity (used at the access method level). Using this basic kernel design a retrofit of the DBMS kernel was developed for Ingres, a relational DBMS. Also included is an abstract model for value independent, data secure DBMSs which can be used as a basis for certifying a DBMS kernel. In order to support the secure DBMS a data secure operating system is needed which allows only the DBMS read access to the data base and the DBMS kernel read and write access. Access to the data base by other processess is prohibited. The data secure operating system must also supply a secure process environment to the DBMS kernel. A correct operating system is needed in order to retrieve exactly the data requested by the DBMS kernel and also only certified operating system code can be included in the DBMS kernel's process space. Dissert. Abstr.

EVALUATION AND ENHANCEMENT OF THE PERFORMANCE OF RELATIONAL DATABASE MANAGEMENT SYSTEMS Ph.D. Thesis
Paula Birdwell Hawthorn 1979 213 p
Avail: Univ. Microfilms Order No. 8014726

In order to determine the performance characteristics of a standard data base system, the performance of the relational data management system INGRES in analyzed. A benchmark analysis technique is used for the performance evaluation. The results show that the performance characteristics of two query types; data-intensive queries and overhead-intensive quries, are so different that it may be difficult to design a single architecture to optimize the performance of both types. Significant sequentially of reference was found in the data-intensive queries. It is shown that back-end data management machines may be cost effective only for data-intensive queries. It is proposed that the best method of distributing the processing of the overhead-intensive query is through the use of intelligent terminals. It is shown that there is significant locality of reference in the multi relation queries. The performance of the INGRES system is compared to estimated performance of serveral database machines. It is found that for significant classes of queries and standard system provides the most cost-effective processing of the queries. Dissert. Abstr.

ACCESS PATH OPTIMIZATION IN MULTIDIMENSIONALLY ACCESSED DATABASE FILES Ph.D. Thesis
Georges Spiridon Nicolas 1979 153 p
Avail: Univ. Microfilms Order No. 8012200

A general access path model for multidimensionally accessed data base fields is developed. This model is capable of characterizing a large class of file organizations. Three principal access path structures are identified and then used to model a general file organization. This organization supports the multidimensional key access feature and includes all the basic file organizations as special cases. A cost function based on both storage and time costs is developed. This cost function quantitatively measures the performance of the data base system and can also be used to evaluate the efficiency of the various classical file organizations.

Optimization techniques which minimize the cost function by producing an optimal design based on the file organization are developed. The general cost problem is first transformed into a set of three simpler cost problems through a series of decomposition and reduction steps. These simpler cost problems are defined as linear integer programming (LIP) models with binary valued variables. Dissert. Abstr.

A SYSTEMATIC APPROACH TO THE MANAGEMENT OF DATA ON DISTRIBUTED DATA BASES Ph.D. Thesis
Benjamin Wan-Sang Wah 1979 313 p
Avail: Univ. Microfilms Order No. 8014919

Data management issues in particular the query decomposition, the file placement, the task scheduling, and the hardware support issues are analyzed and a unified approach is provided to design data management strategies on distributed data bases. Two complementary techniques are developed in query decomposition so that nondecomposable queries which require the use of multiple files can be decomposed into multiple sub-queries which require the use of a single file. By showing that the file placement problem and the facility location problem are isomorphic, many results derived in one problem can be applied to solve the other problem. Further, some results derived in one problem can be shown to be weaker than the corresponding results derived in the other problem. The task scheduling problem for a distributed system is shown to be NP-complete. However, an optimal average algorithm is developed for a restricted class which minimizes the expected completion time for a set of random requests. In the hardware support issue, the design of an associative memory which is capable of equality, proximity, threshold, and extremum searches is investigated. Dissert. Abstr.

SPATIAL DATA MANAGEMENT SYSTEM Quarterly Research and Development Technical Report, 1 Jun. - 31 Aug. 1979
Mark Friedell, David Kramlich, Christopher F. Herot, and Richard Carling 31 Aug. 1979 44 p refs Original contains color illustrations
(Contract MDA903-78-C-0122; ARPA Order 3487)
(AD-A083948) Avail: NTIS HC A03/MF A01 CSCL 05/2

This technical report describes work completed on a prototype Spatial Data Management System (SDMS). The Graphical Display of Data presents an overview of the icon creation mechanisms currently included in SDMS. Icon creation is the facility by which graphical representations of symbolic data are automatically produced. These graphical representations are referred to as 'icons'. Section two includes detailed discussions of the icon creation features added to the system: Secondary data a mechanism by which information in multiple relations or tuples may be presented in a single icon, and a subicons mechanism that allows the appearance of a portion of an icon to be described independently of its parent icon. AN ARCHITECTURE FOR INFORMATION SYSTEMS MANAGEMENT
Bennet P. Lientz and Myles Chen May 1980 36 p
(Contract N00014-75-C-0266; NR Proj. 049-345)
(AD-A084545) Avail: NTIS HC A03/MF A01 CSCL 05/1

There has been an increased effort in general management and information systems management to organize information systems and computer activities to respond to organization requirements on a more effective and efficient basis. A model of the current information systems architecture is developed and evaluated. Requirements for a new architecture are determined based on user, manager, and technology needs. An information systems organization architecture is then developed. The architecture is related to Nolan's organizational stages of growth, decision support systems, and information resource management. Implementation and several examples of application are discussed. GRA

IMAGE CODING: REPORT OF A WORKSHOP
V. Ralph Algazi, ed. Sep. 1979 189 p refs Workshop held at Boulder, Colo., 14-16 Dec. 1977
(Grants NSF ENG-77-09121; NSF ENG-78-11521)
(PB80-164817; SIPL-79-5; NSF/RA-790300) Avail: NTIS HC A09/MF A01 CSCL 09D

The state-of-the art in fundamental and applied areas of image coding is addressed. Objectives focus on the following areas: (1) a broad and critical assessment of the state of knowledge in image coding and the trends in image transmission and decoding; (2) a description of the areas of research and experimentation needed for a systematic understanding and implementation of image coding; and (3) a determination of the needed future research both to provide fundamental knowledge and for the use of recent technological advances in image coding. Major emphases is placed on the human observer, image as data sources, the theoretical basis of image coding, a survey of image encoders, and a survey of applications and implementations. GRA

REPORT OF THE ADVISORY COMMITTEE ON INFORMATION NETWORK STRUCTURE AND FUNCTIONS FOR THE EXECUTIVE OFFICE OF THE PRESIDENT
Feb. 1980 64 p refs
(PB80-165673) Avail: NTIS HC A04/MF A01 CSCL 05B

An information network proposed for the Executive Office of the President (EOP) is described. The EOP information Network is defined as consisting of all nonmission oriented information processing and data communication services along with supporting software and hardware systems that are centrally administered and common to the EOP user community. This network is moreover viewed as a center of stability or city plan, which permits the orderly evolution of EOP information systems along any one of several diverse alternatives, as dictated by technology, user needs, and the increasing trends toward resource decentralization. PHASE 1 OF THE NEAR TERM HYBRID PASSENGER VEHICLE DEVELOPMENT PROGRAM Final Report
P. Montalenti and R. Piccolo 21 Sep. 1979 143 p refs
(Contract JPL-955197)
(NASA-CR-163219; JPL-9950-330) Avail: NTIS HC A07/MF A01 CSCL 13F

In order to meet project requirements and be competitive in the 1985 market, the proposed six-passenger vehicle incorporates a high power type Ni-Zn battery, which by making electric-only traction possible, permits the achievement of an optimized control strategy based on electric-only traction to a set battery depth of discharge, followed by hybrid operation with thermal primary energy. This results in a highly efficient hybrid propulsion subsystem. Technical solutions are available to contain energy waste by reducing vehicle weight, rolling resistance, and drag coefficient. Repoacing new 1985 full size vehicles of the conventional type with hybrids of the proposed type would result in a U.S. average gasoline saving per vehicle of 1,261 liters/year and an average energy saving per vehicle of 27,133 MJ/year. A.R.H.

PHASE 1 OF THE NEAR TERM HYBRID PASSENGER VEHICLES DEVELOPMENT PROGRAM. APPENDIX A: MISSION ANALYSIS AND PERFORMANCE SPECIFICATION STUDIES, VOLUME 1 Final Report
M. Traversi and L. A. C. Barbarek (Illinois Inst. of Technology) 20 Apr. 1979 157 p
(Contract JPL-955187)
(NASA-CR-163220; JPL-9950-330) Avail: NTIS HC A08/MF A01 CSCL 13F

Applicable data was categorized and processed according to vehicle usage and trip parameters with consideration of payload (cargo, people, size) and driving cycles. A mission that maximizes the fuel potential savings for the total 1985 vehicle fleet was selected. Mission requirements that have a bearing on conventional and hybrid vehicle performance and characteristics were identified and formulated and a reference ICE vehicle was selected that meets or exceeds all requirements while maintaining within applicable constraints. Specifications for vehicle performance were established based on mission requirements, mission related vehicle characteristics, and fuel consumption. A.R.H.

PRELIMINARY RESULTS OF STEADY STATE CHARACTERIZATION OF NEAR TERM ELECTRIC VEHICLE BREADBOARD PROPULSION SYSTEM
Noel B. Sargent Jul. 1980 10 p
(Contract EC-77-A-31-1011)
(NASA-TM-81546; DOE/NASA/1011-31; E-502) Avail: NTIS HC A02/MF A01 CSCL 13F

The steady state test results on a breadboard version of the General Electric Near Term Electric Vehicle (ETV-1) are discussed. The breadboard was built using exact duplicate vehicle propulsion system components with few exceptions. Full instrumentation was provided to measure individual component efficiencies. Tests were conducted on a 50 hp dynamometer in a road load simulator facility. Characterization of the propulsion system over the lower half of the speed-torque operating range has shown the system efficiency to be composed of a predominant motor loss plus a speed dependent transaxle loss. At the lower speeds with normal road loads the armature chopper loss is also a significant factor. At the conditions corresponding to a cycle for which the vehicle system was specifically designed, the efficiencies are near optimum. M.G.

SMALL PASSENGER CAR TRANSMISSION TEST-CHEVROLET 200 TRANSMISSION Final Report
M. P. Bujold Mar. 1980 381 p
(Contracts DEN3-124; EC-77-A-31-1044)
(NASA-CR-159835; DOE/NASA/0124-1; ERC-L1B-79168) Avail: NTIS HC A17/MF A01 CSCL 13F

The small passenger car transmission was tested to supply electric vehicle manufacturers with technical information regarding the performance of commerically available transmissions which would enable them to design a more energy efficient vehicle. With this information the manufacturers could estimate vehicle driving range as well as speed and torque requirements for specific road load performance characteristics. A 1979 Chevrolet Model 200 automatic transmission was tested per a passenger car automatic transmission test code (SAE J651b) which required drive performance, coast performance, and no load test conditions. The transmission attained maximum efficiencies in the mid-eighty percent range for both drive performance tests and coast performance tests. Torque, speed and efficiency curves map the complete performance characteristics for Chevrolet Model 200 transmission. L.F.M.

NATIONAL CRASH SEVERITY STUDY STATISTICS Special Report, Jan. 1977 - Mar. 1978
Leda Ricci Oct. 1979 113 p
(Contract DOT-HS-8-01944)
(PB80-16040; UM-HSRI-79-80; DOT-HS-805227) Avail: NTIS HC A06/MF A01 CSCL 13L

Statistical data from accidents investigated in seven geographical areas within the continental United States is presented. The accidents were selected so that the aggregate of the areas closely resembles the urbanization distribution of the entire country. Within each area a stratified sampling plan was used to gather detailed information on passenger cars (and their occupants) in crashes severe enough to require that the vehicles be towed from the scene. The combined investigations presented account for 6,626 crashes, 8,616 towed vehicles, 14,491 vehicle occupants, and 485 fatalities. The tables and figures were generated using a computer file of national crash severity study data and represent only a very broad treatment of the data. GRA

ANAEROBIC-ACTIVATED CARBON FILTERS FOR THE REMOVAL OF REFRACTORY AND TOXIC ORGANIC COMPOUNDS IN WASTEWATER Technical Completion Report, Oct. 1977 - Sep. 1979
Makram T. Suidan, Wendall H. Cross, Madeline Fong, John W. Calvert, and Khalique A. Khan Nov. 1979 179 p refs
(PB80-164254; ERC-08-79; W80-04205; OWRT-A-077-GA(1))
Avail: NTIS HC A09/MF A01 CSCL 13B

An anaerobic filter with granular activated carbon was developed and tested for the effective and energy efficient treatment of waste water containing phenolic compounds. Two identical experimental reactors consisting of four jacketed columns and three clarifiers connected in series were tested. Each column had a reversible recirculation pump for the recirculation of the aqueous contents around each individual reactor. Granular activated carbon served as a media for microbial attachment, substrate concentration, and polarization. A feed substrate flow rate of 2 ml/min giving a total empty bed contact time of 46.48 hours was used with a recirculation flow rate of 50 ml/min. Two phenolic compounds, catechol and o-cresol, were tested at different organic loading rates in the reactors. GRA

IDENTIFICATION OF SUPERIOR ENERGY-ABSORBING MATERIALS FOR SCHOOL BUS INTERIORS. VOLUME 1: SUMMARY REPORT Final Report, 3 Aug. 1977 - 30 Jun. 1979
Lonney S. Pauls Jan. 1980 49 p 3 Vol.
(Contract DOT-HS-7-01664)
(PB80-165269; DOT-HS-805370-Vol-1) Avail: NTIS HC A03/MF A01 CSCL 13F

The problem of identifying and selecting superior energy absorbing materials for school bus interiors was approached by developing material selection criteria to be applied to superior energy absorbing materials currently on or nearing the market. The established material selection criteria gives consideration to: (1) high temperature performance (i.e., igniteability, flame spread, smoke emissions and toxicity, (2) shock attenuation (compliance to injury criteria), (3) energy absorption, and (4) general design (e.g., cost and weight effectiveness, environmental and vandal resistiveness, etc.). Materials were evaluated and screened, using this established criteria, and a set of preferred materials tested experimentally to verify their compliances to these criteria. Tests included flammability, dynamic drop and sled impact tests. GRA

LOW SURFACE BRIGHTNESS SPIRAL GALAXIES Ph.D. Thesis
William Romanishin 1980 174 p
Avail: Univ. Microfilms Order No. 8015591

An observational overview of a sample of low surface brightness (LSB) spiral galaxies is presented. The sample galaxies were chosen to have low surface brightness disks and indications of spiral structure visible on the Palomar Sky Survey. Photographic surface photometry, HII region spectrophotometry, long-slit spectra and neutral hydrogen 21 cm radio observations are documented for a selection of the sample galaxies. The findings indicate that the average disk central surface brightness of the LSB galaxies is 22.88 magnitude/arcsec2 in the B passband. The average disk scale length is about 4 kpc, almost as large as for a sample of giant late-type systems. From broadband color measurements of the old stellar population, a low average stellar metallicity, on the order of 1/5 solar is inferred. The spectra and optical colors of the HII regions in the LSB galaxies indicate a lack of hot ionizing stars compared to HII regions in other late type galaxies. The average surface mass density is less than half that of a sample of normal late-type spirals. The average LSB galaxy neutral hydrogen mass to blue luminosity ratio is about 0.6, significantly higher than in a sample of normal late-type galaxies. Dissert. Abstr.

STELLAR EXTREME ULTRAVIOLET SPECTROSCOPY Ph.D. Thesis
Roger Frank Malina 1979 162 p
Avail: Univ. Microfilms Order No. 8014793

The feasibility of stellar extreme ultraviolet (EUV) spectroscopy is analysed. A stellar EUV spectrometer was built to carry out the observations; its design, fabrication and performance are described at length. The instrument was launched on a sounding rocket and the observation targets were the stars HZ 43, Capella and Arcturus. HZ 43 was detected from 170 A to 500 A with a 15 A resolution. The spectrum observed was marked by a prominent absorption edge of 225 A + or - 15 A with a ratio F sub lambda (230 A)/F sub lambda (220 A) = 0.51 + or - 0.13. The upper limit on the equivalent width of emission and absorption lines was 10 A. The discontinuity observed in HZ 43 is attributed to absorption at the 228 A Lyman edge of singly ionized helium. The required photospheric helium surface density is 0.00001 < or = < 0.00003 for a T sub eff = 60,000 K, as derived by comparison with existing photospheric models. If this interpretation is correct, it provides the first determination of the helium abundance in a DA white dwarf. Dissert. Abstr.

AIRBORNE INFRARED SPECTROSCOPY OF IONIZED HYDROGEN REGIONS AND THE GALACTIC CENTER Ph.D. Thesis
John Francis McCarthy 1980 212 p
Avail: Univ. Microfilms Order No. 8015710

Observations from a ten channel liquid helium cooled grating spectrometer developed for astronomical observations in the 16 to 30 microns region are discussed. Ten bright galactic ionized hydrogen regions have been surveyed for line radiation at 18.7 micron from the (3)P sub 2 to (3)P sub 1 transition in the ground state of doubly ionized sulfur. The 16 to 30 microns continuum spectrum of the galactic center, Sgr A West, has been measured, and the region has been mapped at 19 and 28 microns with 30 in. resolution. In the continuum spectra, a broad depression centered on 18 microns is attributed to absorption by cold silicate dust grains in the line of sight. The [SIII] 18.7 microns line was detected in nine galactic HII regions (Orion, M17, M8, NGC 6357, NGC 2024, W3, W33, W49, and W51) and mapped in M17. Comparison with the data shows good agreement for Orion, M17, and M8. In NGC 6357 the observed flux is higher than expected, perhaps because of an overabundance of sulfur. In all other cases, the observed flux is lower than expected, and dust extinction is the most plausible explanation for the discrepancy. Dissert. Abstr.

HI SHELLS IN THE GALAXY Ph.D. Thesis
Esther Ming Hu 1980 76 p
Avail: Univ. Microfilms Order No. 8015122

A search was made for HI shells in the 21 cm maps for the absolute value of b > 10 degrees. A filter in the velocity dimension was used to enhance shell features over background gas. Positions, expansion velocities, column densities, and angular extents were measured for the 50 shells that were discovered. Incorporating distance estimated, masses, and kinetic energies were estimated for the shells. The distribution of HI shells was compared with the distribution of other large scale features in the galaxy: HI shell structures are found to correlate with the positions of radio continuum loops, I, II, and III and to show little relation to the distribution of O and B stars. It is concluded that HI shells correspond to supernova events in the gaseous disk. The shells may be modeled in three ways: (1) supernova remnants occurring in clouds; (2) imploded clouds in the over pressured cavities of remnants; and (3) swept out clouds within more extended supernova remnants. Dissert. Abstr.

A 346 GHz HETERODYNE RECEIVER AND ITS USE IN OBSERVATIONS OF CARBON MONOXIDE IN INTERSTELLAR CLOUDS Ph.D. Thesis
Neal Rider Erickson 1979 166 p
Avail: Univ. Microfilms Order No. 8014666

The design and construction of a receiver for use at a frequency of 346 GHz is described. The mixer's frequency response extends from 260-350 GHz with nearly constant sensitivity, with a system noise temperature of 3400 K at 318 GHz. When used on the 60 inch telescope on Mt. Lemmon, the J = 3 yields 2 line of CO at 346 GHz was detected in 9 sources, but pointing and baseline problems caused much of the data to be unreliable. A 14 point map was obtained of Orion A and is compared to the 1 yields 0 spectra. In the case of the central region of Orion A the similarity of the spectra is quite striking. This receiver is used to make observations in the 260-282 GHz retion using a 4.9 m telescope. Molecules observed included HCN, HCO(+), N2H(+), SO2, HC3N, H2CO and HNC. These observations established that the 1mm region is very rich in spectral lines of moderate strength, and that further observations in the submillimeter range should be quite productive. Dissert. Abstr.

INFRARED FINE-STRUCTURE LINE EMISSION FROM THE GALACTIC CENTER Ph.D. Thesis
John Howard Lacy 1979 156 p
Avail: Univ. Microfilms Order No. 8014767

A spectrometer optimized for detection of single emission and absorption lines from astronomical sources, in the 8 to 13 micron atmospheric window is described. Observations have been made from the galactic center source Sgr A West. These observations show a complex array of small ionized gas clouds in the central few pc of the Galaxy. Ne II (12.8 microns) emission from these sources has been both spatially and spectrally resolved. Sensitive searches were made for Ar III, S IV, and Ar V emission to determine the level of ionization of the clouds. The velocities

of the clouds indicate the presence of approximately 6 million solar mass within 1 pc of the galactic center and suggest that about half of that may be in the form of a massive central black hole. Consideration of possible means of binding individual clouds leads to the conclusion that they are freely expanding and so must be generated at a rate of approximately 1 cloud/1000 yr. Models are proposed to explain the creation, ionization, and ultimate fate of the clouds. Possible further observations which may prove or disprove the existence of a black hole are discussed. Dissert. Abstr.

N80-28270 Princeton Univ., N. J.
BROADBAND PHOTOMETRY OF GALAXIES IN TWO DISTANT CLUSTERS WITH A CHARGE-COUPLED DEVICE CAMERA Ph.D. Thesis
Marshall William Bautz 1980 142 p
Avail: Univ. Microfilms Order No. 8016163

Observations from the direct imaging channel of the Princeton Charge Coupled Device spectrometer directed toward four color broadband photometry of two distant clusters of galaxies are discussed. Data reduction techniques were developed to extract photometric information from small images of low surface brightness. These techniques were applied to obtain broadband colors in the spectral range between 5000 and 9000 Angstroms down to a limiting apparent visual magnitude of about 21.5. The observed colors show no evidence for the presence of substantial numbers of young blue stars. There is some evidence for an anomalously broad distribution of color in the spectral range between 7000 and 9000 Angstroms. Dissert. Abstr.

OBSERVATIONS OF EMISSION LINES IN M SUPERGIANTS Final Report
David L. Lambert 1 Aug. 1979 5 p refs
(Grant NsG-5005)
(NASA-CR-163359) Avail: NTIS HC A02/MF A01 CSCL 03A

Copernicus observations of Mg 2 h and k emission lines from M giants and supergiants are described. Supergiants with extensive circumstellar gas shells show an asymmetric k line. The asymmetry is ascribed to superimposed lines of Fe 1 and Mn 1. The Mg 2 line width fit the Wilson-Bappu relation derived from observations of G and K Stars. Results of correlated ground-based observations include (1) the discovery of K 1 fluorescent emission from the Betelgeuse shell; (2) extimates of the mass-loss rates; and (3) the proposal that silicate dust grains must account for the major fraction of the Si atoms in the Betelgeuse shell. A SOLAR EXTREME ULTRAVIOLET TELESCOPE AND SPECTROGRAPH FOR SPACE SHUTTLE. VOLUME 1: INVESTIGATION AND TECHNICAL PLAN
Werner M. Neupert Nov. 1978 58 p refs
(NASA-TM-80643) Avail: NTIS HC A04/MF A01 CSCL 03A

A scientific investigation of heating and mass transport in the solar corona that is currently planned for a future Shuttle/Spacelab flight is outlined. The instrument to be used is a near-normal incidence grating spectrograph fed by a grazing incidence Wolter Type 2 telescope. A toroidal grating design provides stigmatic images of the corona up to 8 arc min in extent over the spectral region from 225 A to 370 A. Spatial resolution of at least 2 arc sec and spectral resolution of 0.050 A is achievable throughout the central 4 arc min field or view. Primary scientific data are recorded on Schumann-type film. An H-alpha slit jaw monitor and zero order extreme ultraviolet monitor are also planned to support instrument operation. M.G.

IUE OBSERVATIONS OF A LUMINOUS M SUPERGIANT THAT EXHIBITS INTENSE CONTINUUM IN THE FAR ULTRAVIOLET
A. G. Michalitsianos, M. Kafatos, and R. W. Hobbs Apr. 1980 21 p refs Submitted for publication
(NASA-TM-80681) Avail: NTIS HC A02/MF A01 CSCL 03A

Observations of the late type M supergiant TV Gem (M1 Iab) reveal strong UV continuum between 1200 A and 3200 A. The continuum is essentially featureless with the exception of a number of broad absorption features in the short wavelength spectra range. An absorption feature centered around 1400 A could be due to Si IV absorption found typically in spectra of middle B type stars. UV emission from this star is unexpected because earlier ground-based observations give no indication of a possible association with an early companion or circumstellar ionized nebulosity. A B9 or A1 III - IV type star approximately 2 to 3 magnitudes fainter than the M star could explain the level of UV continuum observed, but a fully self consistent explanation that includes the B-V color index of TV Gem is not as yet possible. The continuum flux dependence with wavelength in the UV spectral range could be attributed to a high energy source such as an accretion disc. It is suggested TV Gem is a good candidate for HEAO-2 (Einstein) satellite observations because a high energy object in close proximity to the M star would likely be a source of soft X-ray emission. STAR CLUSTERS CONTAINING MASSIVE, CENTRAL BLACK HOLES: EVOLUTION CALCULATIONS Ph.D. Thesis
Alan Bruce Marchant 1980 84 p
Avail: Univ. Microfilms Order No. 8015709

Detailed, two dimensional simulations of star cluster evolution are discussed. A Monte-Carlo method is adapted to simulate the development with time of isolated star clusters. Clusters which evolve on relaxation timescales are treated with and without central black holes. The method is applied to follow the development and core collapse of an initial Plummer-model cluster without a central black hole. By extending this calculation to later dynamical stages, it is shown that core collapse occurs in a smooth, homological fashion with continual 'evaporation' of stars from the core into the developing halo. Three calculations of cluster re-expansion are presented each begining with the

insertion of a black hole at the center of a highly collapsed cluster core. Each case is characterized by a different value of initial black hole mass or black hole accretion efficiency for the consumption of debris from disrupted stars. The various re-expansion behaviors are interpreted in terms of simple quasi-static balance between cusp heating are interpreted and conduction of the heat through the core and into the halo. It is found that for the special cases examined here substantial, but not catastrophic, growth of the central black hole may accompany core re-expansion. Dissert. Abstr.

THE DISTRIBUTION OF G5-K5 STARS IN A REGION AT THE SOUTH GALACTIC POLE Ph.D. Thesis
Raymond Charles McNeil 1980 250 p
Avail: Univ. Microfilms Order No. 8015908

An objective prism survey (dispersion 580 A/mm at H gamma) of more than 2200 late type stars is documented for an 81 square degree region at the south galactic pole (SGP). The limiting magnitude of the survey is V = 13(m)5. The objective prism classifications, photographic apparent visual magnitudes, and plate positions determined for the program stars are presented in the form of a catalog. The data are then used to discuss the distribution of the G5-M dwarfs and to derive, analytically, the space density distribution of the G5-M giants to a z-distance of 2000 parsecs. The percentage of dwarfs observed in the survey is about the same or slightly higher than the percentage found for magnitudes brighter than V approximates 11(m)5. The rate of increase in the number of dwarfs per half-magnitude interval with increasing magnitude is not great enough to be consistent with a uniform density distribution at the SGP, however. Dissert. Abstr.

ON THE STABILITY AND DYNAMICS OF DISK GALAXIES: CONSIDERATIONS ON THE AXISYMMETRIC BACKGROUND Ph.D Thesis
Robert Grant Hohlfield 1980 141 p
Avail: Univ. Microfilms Order No. 8015678

The stability and dynamics of the axisymmetric mass profile of disk galaxies are considered. A detailed treatment fo flat disk equilibria supported principally by rotation is given. The theory of the integral equations relating rotation curves and mass surface densities is extended. Computer programs are developed which treat the computational difficulties or relating mass surface densities and rotation curves for these galaxies. An analytic family of rotation curves and corresponding mass surface density profiles is derived which is appropriate for the representation of the flat rotation curves. The hypothesis that the dark matter at large galactocentric distances (implied by the existence of flat rotation curves) is in the form of late spectral-type stars is studied and tested. The Nyquist stability technique is generalized to a global stability technique for the study of galactic stability problems. The axisymmetric global stability problem of a flat disk of stars is reduced to the character of an eigenvalue problem, and the nature of the nonaxisymmetric global stability problem is indicated. Finally, the negative mass instability of flat galactic disks is studied in detail. Dissert. Abstr.

A NEUTRAL HYDROGEN SURVEY OF BLUE COMPACT GALAXIES Ph.D. Thesis
David Gordon 1979 157 p
Avail: Univ. Microfilms Order No. 8016535

The 21 cm neutral hydrogen line observations of 99 compact galaxies, most of the blue or very blue, are reported. Of these, 72 are detected in HI. These systems are found to be richer in HI than late type galaxies of the Hubble sequence and also to have higher surface luninosities. Approximately half of these blue compact systems are bluer than the bluest late type galaxies. Their HI velocity profiles are often narrow and single peaked, most often for the lower luminosity systems. However, the evidence suggests that the compact galaxies are rotating disk systems, perhaps with a strong central concentration of HI. The observations also indicate that at least some of these systems are quite extensive in their overall HI dimensions. It is possible that these HI rich, blue compact galaxies are old systems which have not yet completed their collapse out of the intergalactic medium. Primordial gas may be condensing into their central regions and could be the source of gas for intermittent, brief bursts of star formation. Dissert. Abstr.

The nature of type 1 supernovae (SN 1) is discussed through a comparison of observational evidence and theoretical perspectives relating to both type 1 and 2 supernovae. In particular two hypotheses relating to SN 1 phenomenon are examined: the first proposing that SN 1 are components of binary systems in which, at a comparatively late stage of evolution, overflow of the mass occurs; the second considers pre-SN 1 to be recently evolved stars with a mass greater than 1.4 solar mass (white dwarfs). In addition, an explanation of the reduced frequency of flares of SN 1 in spiral galaxies as related to that in elliptical galaxies is presented. M.G.

AN ANALYTICAL INTEGRATION OF THE AVERAGED EQUATIONS OF VARIATION DUE TO SUN-MOON PERTURBATIONS AND ITS APPLICATION Final Report, Oct. 1978 - Mar. 1979
C. C. Chao Oct. 1979 46 p refs
(Contract F04701-79-C-0080)
(AD-A083231; TR-0080(5473-03)-1; SD-TR-80-12) Avail: NTIS HC A03/MF A01 CSCL 20/3

The perturbed variations of the motion of Earth satellites due to the Sun and the moon are derived from a singlely averaged disturbing function. A first-order solution is obtained by analytically integrating the equations of variation including J2, J2-squared, J3, and J4. The literal expansions are carried out by computer in terms of classical elements. The secular part of the first order solution is included in the reference orbit. The orbits of the Sun and the Moon are assumed circular, and the motion of the moon is converted to the earth equatorial system with certain approximations. Results based on the GPS (Global Positioning System) satellites compare favorably with numerical integration for time spans of up to three years. An algorithm applying the first order solution has been developed to achieve the desired strategy of orbit maintenance for the GPS Phase 3 system. The analytical solutions provide insight into the long term (10 yr) variations of the orbit elements of GPS satellites. GRA

ON THE PERIODICITIES OF SATURN'S REFLECTIVITY IN THE VISIBLE Ph.D. Thesis
James Robert Johnson 1979 113 p
Avail: Univ. Microfilms Order No. 8011960

Periodogram analysis of Saturn images from 1924 to 1965 revealed an 11 year periodicity in Saturn's yellow reflectivity. A periodicity of 7 years was also seen which may be evidence of seasonal variations. Trends in the 11 year peak over the various latitude regions support evidence that a fundamental difference existed in 1977 in the absorbing particle layer, between the south polar region and equatorial zone. It is proposed that the aerospace layers are chiefly responsible for the periodic changes in the yellow reflectivity. The most urgent problem, requiring a solution for Saturn studies, is the identity of the absorbing particles and their photochemical products. Dissert. Abstr.

PHOTOMETRIC PROPERTIES OF CARBONACEOUS CHONDRITES AND RELATED MATERIALS Ph.D. Thesis
Linda Susan French 1980 265 p
Avail: Univ. Microfilms Order No. 8015668

Absolute reflectance spectra and limb darkening parameters were measured for one member of each of the three major petrologic types of carbonaceous chondrites: Orgueil (C1), Murchison (C2), and Allende (C3) over the wavelength range from 0.25 to 1.15 microns. The spectra of carbonaceous chondrites are flat throughout the visible and near-infrared. At some critical wavelength the reflectance begins decreasing rapidly into the ultraviolet. The limb darkening behavior of all three meteorites was analyzed according to Minnaert's law. All show some limb darkening, with values of k = 0.55-0.58 near opposition. Viking Orbiter images taken near opposition indicate the satellites are limb darkened; after correction for smearing, limb darkening parameters of 0.55-0.65 for the satellites are derived which are consistent with those of carbonaceous chondrites. The bright patches on Deimos are approximately 30% brighter than the surrounding material, a value consistent with the reflectances measured for different particle sizes of Murchison. Dissert. Abstr.

LIGHT SCATTERING IN A SPHERICAL PLANETARY ATMOSPHERE, WITH APPLICATIONS TO VENUS Ph.D. Thesis
David Lee Wallach 1979 114 p
Avail: Univ. Microfilms Order No. 8015333

The single-scattering reflectance was derived for a planet with a spherically uniform distribution of scatterers whose density decreases exponentially with altitude with a scale height small compared with the radius of the planet. Using a power series expansion and retaining terms to second order one can integrate the resulting expression on a programmable calculator. The planar atmosphere was found to apply for angles of incidence and exit smaller than 84. When the angles are larger than 84, it was shown that the single scattering solution could be reduced to an equivalent Lommel-Seeliger problem by using effective values of incidence and exit angles. The active zone, where most of the contribution to the brightness occurs was found to be a small region of the atmosphere in that the atmosphere can be approximated as locally planar. First-order corrections for multiple-scattering and non-isotropic scattering can then be made using the palnar expressions with an adjusted geometry. The results were applied to some of the Marinar 10 pictures of the terminator and limb of Venus. Dissert. Abstr.

SYNOPTIC OBSERVATIONS OF JUPITER'S RADIO EMISSIONS: AVERAGE STATISTICAL PROPERTIES OBSERVED BY VOYAGER
J. K. Alexander, T. D. Carr (Florida Univ., Gainesville), J. R. Thieman (ORI, Inc., Silver Spring, Md.), J. J. Schauble (Florida Univ. Graduate Center, Eglin AFB), and A. C. Riddle (Cooperative Inst. for Research in Environmental Science, Boulder, Colo.) Jun. 1980 43 p refs Submitted for publication
(NASA-TM-80717) Avail: NTIS HC A03/MF A01 CSCL 03B

Observations of Jupiter's low frequency radio emissions collected over one month intervals before and after each Voyager encounter were analyzed. Compilations of occurrence probability, average power flux density and average sense of circular polarization are presented as a function of central meridian longitude, phase of Io, and frequency. The results are compared with ground based observations. The necessary geometrical conditions are preferred polarization sense for Io-related decametric emission observed by Voyager from above both the dayside and nightside hemispheres are found to be essentially the same as are observed in Earth based studies. On the other hand, there is a clear local time dependence in the Io-independent decametric emission. Io appears to have an influence on average flux density of the emission down to below 2 MHz. The average power flux density spectrum of Jupiter's emission has a broad peak near 9 MHz. Integration of the average spectrum over all frequencies gives a total radiated power for an isotropic source of 4 x 10 to the 11th power W. A.R.H.

CORONAL HEATING BY STOCHASTIC MAGNETIC PUMPING
P. A. Sturrock and Y. Uchida (Tokyo Astronomical Observatory) Jun. 1980 19 p refs Submitted for publication
(Grant NGL-05-020-272; Contract N00014-75-C-0673)
(NASA-CR-163356; SU-SUIPR-809) Avail: NTIS HC A02/MF A01 CSCL 03B

Recent observational data cast serious doubt on the widely held view that the Sun's corona is heated by traveling waves (acoustic or magnetohydrodynamic). It is proposed that the energy responsible for heating the corona is derived from the free energy of the coronal magnetic field derived from motion of the 'feet' of magnetic field lines in the photosphere. Stochastic motion of the feet of magnetic field lines leads, on the average, to a linear increase of magnetic free energy with time. This rate of energy input is calculated for a simple model of a single thin flux tube. The model appears to agree well with observational data if the magnetic flux originates in small regions of high magnetic field strength. On combining this energy input with estimates of energy loss by radiation and of energy redistribution by thermal conduction, we obtain scaling laws for density and

temperature in terms of length and coronal magnetic field strength. Author

(NASA-CR-160001) Avail: NTIS HC A04/MF A01 CSCL 03B

The XSST (X-Ray Spectrometer/Spectrograph Telescope) rocket payload launched by a Nike Boosted Black Brant was designed to provide high spectral resolution coronal soft X-ray line information on a spectrographic plate, as well as time resolved photo-electric records of pre-selected lines and spectral regions. This spectral data is obtained from a 1 x 10 arc second solar region defined by the paraboloidal telescope of the XSST. The transition region camera provided full disc images in selected spectral intervals originating in lower temperature zones than the emitting regions accessible to the XSST. A H-alpha camera system allowed referencing the measurements to the chromospheric temperatures and altitudes. Payload flight and recovery information is provided along with X-ray photoelectric and UV flight data, transition camera results and a summary of the anomalies encountered. Instrument mechanical stability and spectrometer pointing direction are also examined. A.R.H.

THE X-RAY SPECTRUM OF QSO 0241+622
D. M. Worrall, E. A. Boldt, S. S. Holt, and P. J. Serlemitsos Feb. 1980 27 p refs Submitted for publication
(NASA-TM-80645) Avail: NTIS HC A03/MF A01 CSCL 03B

Proportional counters on the OsO-8 spacecraft measured the X-ray spectrum of QSR 0241+622 in the range 2-50 keV. The best power law fit has a proton spectral index and 90 percent errors gamma = 1.93 (+0.5, -0.3) and low energy absorption consistent with reported gas column densities, but a thermal bremsstrahlung form with temperature 13.1 keV cannot be excluded. No indication of spectral variability is found in three observations of the source with HEAO-A2, although a possible 15-30 percent intensity change over a period of 6 months was observed. The quasar is similar to 3C 273 in the proportion of energy emitted in various bands, excluding the radio, if reported radiation above 50 keV from its direction is indeed associated with QSO 0241+622. The two quasars are compared and possible energy generation scenarios are discussed. Implications concerning quasar contributions to the diffuse background are discussed. A.R.H.

THE HEAO A-2 SURVEY OF ABELL CLUSTERS AND THE X-RAY LUMINOSITY FUNCTION
J. D. McKee, R. F. Mushotzky, E. A. Boldt, S. S. Holt, F. E. Marshall, S. H. Pravdo, and P. J. Serlemitsos Apr. 1980 42 p refs Submitted for publication
(Contract NAS8-33346)
(NASA-TM-80680) Avail: NTIS HC A03/MF A01 CSCL 03B

The HEAO A-2 all sky data base was surveyed for 2-10 KeV X-ray emission from the 225 Abell clusters og galaxies listed in Abell's (1958) catalof which are of distance class four or less, and are within the fraction of the sky surveyed completely by Abell. Thirty-two identifications of clusters with X-ray sources were made, for which 2-10 KeV fluxes and 90% error boxes are presented. Twelve of these identification are new. The X-ray luminosity function was derived for this statistically complete sample and the best exponential fit was found to be f(L) = 20.2 x 10 to the minus 8 power exp (-l(44)/1.9) per cu Mpc 2-10 KeV. The relationship between X-ray luminosity and richness was examined and a correlation was found for richness classes 0, 1, and 2. The relationship of X-rau luminosity, Bautz-Morgan type, and Rood-Sastry type was examined. It was found that BM type I's and RS type cD and B have the greatest average luminosity. The contribution of clusters to the X-ray background was calculated from the luminosity function and was found to be 5%, and with 90% certainty, less than 8% in the 2-10 KeV band pass. A.R.H.

[ACTIVITIES OF THE KLOPPENHEIM SATELLITE OBSERVATION STATION]
Hansdieter Grosse and Gerhard Soltau 1979 10 p refs In GERMAN; ENGLISH summary
(Ser-B-230) Avail: NTIS HC A04/MF A01

The activities of the Kloppenheim satellite observation station are described. The determination of the station's position in longitude, latitude, and astronomical azimuth subsequent to its participation in the West European Satellite Triangulation Network and the verification of the measurement constancy of a circumzenithal astrolabe relative to the determination of astronomical coordinates, are discussed. For individual titles, see N80-28293 through N80-28294.

THE KLOPPENHEIM SATELLITE OBSERVATION STATION: DETERMINATION OF LONGITUDE, LATITUDE, AND ASTRONOMICAL AZIMUTH WITH THE PASSAGE INSTRUMENT Ap 70 [SATELLITENBEOBACHTUNGSSTATION KLOPPENHEIM BESTIMMUNG VON LAENGE, BREITE UND AZIMUTH MIT DEM PASSAGEINSTRUMENT Ap 70] c43
Hansdieter Grosse *In its* Activities of the Kloppenheim Satellite Obs. Station 1979 p 5-19 refs In GERMAN; ENGLISH summary (For primary document see N80-28292 18-99)
Avail: NTIS HC A04/MF A01

The Kloppenheim satellite observation station is a participant in the activities of the West European Satellite Triangulation Network. As such its astronomical coordinates had to be determined. The determination of the longitude and latitude as well as of the astronomical azimuth of the reference station are described. The procedure of automatic registration of the time contacts was used for the longitude and azimuth. Author (ESA)

DETERMINATION OF ASTRONOMICAL COORDINATES AT THE KLOPPENHEIM SATELLITE OBSERVATION STATION USING THE CIRCUMZENITHAL ASTROLABE VUGTK; FOR THE PERIOD 1972 TO 1975 [ASTRONOMISCHE KOORDINATENBESTIMMUNGEN AUF DER SATELLITENBEOBACHTUNGSSTATION KLOPPENHEIM MIT DEM ZIRKUMZENITAL VUGTK IN DEN JAHREN 1972 BIS 1975] c89

Gerhard Soltau *In its* Activities of the Kloppenheim Satellite Obs. Station 1979 p 19-27 refs In GERMAN; ENGLISH summary (For primary document see N80-28292 18-99)

Avail: NTIS HC A04/MF A01

The verification of the astronomical system of longitudes of the Federal Republic of Germany, performed in 1973/74, at the Kloppenheim station is described. Longitudes and latitudes were determined in measurement sets for a period of several years by means of the circumzenithal astrolabe VUGTK-CSSR. The results are shown. The coordinate values, obtained at different external conditions, do not show ascertainable systematics. They provide an excellent constancy for the measuring system.

SUBJECT INDEX

Typical Subject Index Listing

The subject heading is the key to the subject content of the document. Titles, report numbers, and accession numbers of pertinent documents are provided under each subject heading. When the title is insufficiently descriptive of the document content, a title extension has been added, separated from the title by three hyphens. The report number helps to indicate the type of document cited (e.g., NASA report, NASA translation, NASA contractor report). The NASA accession number is the number by which the document abstracts are arranged in this journal and by which the document is sold or requested. The titles, with title extensions, if present, are arranged under each subject heading in ascending accession number order. The subject headings have been selected from the latest revision of the *NASA Thesaurus* (NASA SP-7050).

[AD-A081159] N80-27838
Noise Abatement Economic Policy Analysis Model NAEPAM, volume 1
[AD-A081190] N80-27839
Integrated Noise Model (INM). Version 2. User's guide
[AD-A079493] N80-27840
FAA integrated noise model validation. Phase 1: Analysis of integrated noise model calculations for air carrier flyovers
[AD-A081426] N80-27842
Assessment of the environmental compatibility of differing helicopter noise certification standards
[AD-A080525] N80-28153
Correction procedures for aircraft noise data. Volume 1: Pseudotones
[AD-A081962] N80-28157
Correction procedures for aircraft noise data. Volume 2: Background noise considerations
[AD-A082011] N80-28158

AIRCRAFT PERFORMANCE
General aviation pilot and aircraft activity survey, conducted in 1978
[AD-A081726] N80-27276

AIRCRAFT PILOTS
The 1976 accident experience of civilian pilots with static physical defects
[AD-A077189] N80-27304
Vertebral pain in helicopter pilots
[NASA-TM-75792] N80-28043

AIRCRAFT STRUCTURES
The F-4 service life tracking program crack growth gages
[AD-A083978] N80-27353
Costs and benefits of requiring new production of older aircraft types to meet amended noise standards
[AD-A080130] N80-27356

AIRCRAFT TIRES
Tire stiffness and damping determined from static and free-vibration tests --- aircraft tires
[NASA-TP-1671] N80-27302

AIRCRAFT WAKES
FAA/NASA Proceedings Workshop on Wake Vortex Alleviation and Avoidance
[NASA-CR-163317] N80-27285
Chicago monostatic acoustic vortex sensing system. Volume 1: Data collection and reduction
[AD-A076929] N80-27306

AIRFIELD SURFACE MOVEMENTS
Tests of an ATCRBS based trilateration sensor at Logan International Airport
[AD-A078979] N80-27316

AIRFOIL PROFILES
Airfoils at sonic velocity --- Tricomi equation N80-27278
Experimental studies of scale effects on oscillating airfoils at transonic speeds
[NASA-TM-81216] N80-27287

AIRFOILS
A numerical and experimental study of the turbulent wakes of turbomachinery rotor blades, isolated airfoils, and a cascade of airfoils N80-27277
Time-variant aerodynamics for torsional motion of large-turning airfoils
[AD-A083766] N80-27289
Numerical optimization of circulation control airfoils
[AD-A084129] N80-27293
Coupled bending-torsion flutter in cascades with applications to fan and compressor blades N80-27396
Modelling requirements for the calculation of the turbulent flow around airfoils, wings and bodies of revolution N80-27663
Comparison of elastic and elastic-plastic structural analyses for cooled turbine blade airfoils
[NASA-TP-1679] N80-27719

AIRLINE OPERATIONS
Effects of ozone on exercising and sedentary adult men and women representative of the flight attendant population
[AD-A080045] N80-28049

AIRPORT SURFACE DETECTION EQUIPMENT
Introduction on LORADS and ASDE N80-27340

AIRPORTS
Current aviation statistics: Air traffic activity terminal area relationships, fiscal years 1977 and 1978
[AD-A078617] N80-27305
ATARS/ATC simulation tests with site adaptation logic in the Philadelphia terminal area
[AD-A083718] N80-27308
Integrated Noise Model (INM). Version 2. User's guide
[AD-A079493] N80-27840
FAA integrated noise model validation. Phase 1: Analysis of integrated noise model calculations for air carrier flyovers
[AD-A081426] N80-27842

AIRSHIPS
Lighter than air vehicles. Citations from the NTIS data base
[PB80-808066] N80-27298
Lighter than air vehicles. Citations from the Engineering Index data base
[PB80-808074] N80-27299
The development of the zepplin dirigible for long distance transportation
[NASA-TM-76143] N80-27303
Measures for improving the zeppelin airships for long distance transportation
[NASA-TM-76142] N80-27351

AIRSPACE
Air traffic in NATO Europe: Its characteristics and its needs N80-27325

ALASKA
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

ALGORITHMS
Finite element analysis of transonic flows
[AD-A084636] N80-27295
Coalescence/dispersion modelling of gas turbine combustors N80-27384
Analysis of algorithms for advection in discontinuous flows N80-27629
Research on numerical algorithms for the three dimensional Navier-Stokes equations. 1: Accuracy, convergence and efficiency
[AD-A083664] N80-27633
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27859
Experiments in the determination of seismic wave absorption N80-27894
Complexity and computability of solutions to linear programming systems
[AD-A084682] N80-28076
Evaluation of projection algorithms
[PB80-163702] N80-28081
New algorithms for nonlinear least squares and Bayesian parameter estimation
[AD-A083819] N80-28110
Algorithms for solving some undiscounted stochastic games N80-28142
A primal simplex variant for the maximum flow problem
[AD-A084282] N80-28145

ALLOYS
A multitechnique approach to surface studies of metals and alloys using X-ray photoelectron spectroscopy and secondary ion mass spectroscopy N80-27443
Surface properties of antiferromagnetic metals and alloys N80-28217

ALLUVIUM
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona --- Picacho Basin
[PB80-159908] N80-27788

ALPINE METEOROLOGY
Mountain overflow phenomena in satellite imagery
N80-27754

ALTIMETERS
Assessment of atmospheric height uncertainties for high precision satellite altimeter missions to monitor ocean currents
[NASA-CR-156866] N80-27873

ALTITUDE TOLERANCE
Altitude hypoxia. Citations from the NTIS data base
[PB80-807696] N80-28052

ALUMINUM
The sulfidation behavior of nickel-chromium, nickel-aluminum, and nickel-chromium-aluminum alloys with and without yttrium N80-27468
Ultrasonically activated diffusion bonding for fluidic control assembly
[AD-A084658] N80-27702

ALUMINUM ALLOYS
The effect of microstructure on the properties of high strength aluminum alloys
[AD-A083768] N80-27474

ALUMINUM CHLORIDES
Structure of complexes between aluminum chloride and other chlorides, 2: Alkali-(chloroaluminates). Gaseous complexes
[NASA-TM-75762] N80-27452

ALUMINUM COMPOUNDS
Residual stress measurements on aluminum–graphite composite using X-ray diffraction techniques
[AD-A083795] N80-27437

ALUMINUM GALLIUM ARSENIDES
High resistivity molecular beam epitaxial AlGaAs for device applications
[AD-A083778] N80-28221

AMINO ACIDS
State of human bone tissue protein fraction after space flights N80-28018

AMMONIA
X-ray absorption studies of graphite intercalates and metal-ammonia solutions — arsenic fluorocomplexes and rubidium-ammonia N80-28213

AMORPHOUS MATERIALS
Amorphous thin films for solar cell application
[DOE/ET-23040-3] N80-27819

AMORPHOUS SEMICONDUCTORS
Incoherent detection of ultrasonic using thin film amorphous semiconductors
[AD-A083285] N80-28222

AMPLITUDE DISTRIBUTION ANALYSIS
Investigation of amplitude and frequency in seismic reflections: Study of the absorption of reflected seismic studies N80-27893

ANALOG SIMULATION
Distributed sensor systems and electromechanical analog facility
[AD-A084656] N80-28060

ANALOG TO DIGITAL CONVERTERS
Distributed sensor systems and electromechanical analog facility
[AD-A084656] N80-28060

ANALYSIS (MATHEMATICS)
Mathematical Theory of Laminar Combustion. Chapter 5: Unsteady burning of a linear condensate
[AD-A083738] N80-27458

ANIONS
Reaction pathways for electrochemically generated radical anions N80-27447

ANISOTROPIC PLATES
A boundary layer theory for the anisotropic plate
[AD-A083265] N80-27726

ANISOTROPY
Vibration of composite structures
[AD-A084069] N80-27435
Cosmic Rays. Citations from the NTIS data base
[PB80-807647] N80-28291

ANNUAL VARIATIONS
The interannual variability of the stratosphere
N80-27750
Simple seasonal climate models — seasonal temperature field N80-27941
The performance of a seasonal global climatic model — seasonal cycle of the temperature N80-27944
Zonal and seasonal radiative effects of a doubling of atmospheric carbon dioxide concentration — heating of the surface and troposphere N80-27952
Harmonic analysis of feedbacks: A transfer function climate model N80-27954

ANOMALIES
An anomaly in the Pearson product-moment correlation coefficient
[AD-A084354] N80-28138

ANOMALOUS TEMPERATURE ZONES
Stochastic processes in the atmosphere-ocean system — and modeling sea surface temperature anomalies N80-27741
The interannual variability of the stratosphere
N80-27750
Response of the NCAR general circulation model to changed ocean surface temperature N80-27930
Statistical assessments of sea temperature anormaly experiments — effects of sea surface temperature anomalies on the atmosphere
N80-27931
Effect of a Pacific sea-surface temperature anomaly on the circulation over North America: A numerical experiment with the CLAS model N80-27932
A simple model of the atmospheric response to a tropical sea-surface temperature anomaly
N80-27933

ANTARCTIC REGIONS
The composition, sources and sink of South Polar aerosols N80-27830

ANTENNA ARRAYS
Chicago monostatic acoustic vortex sensing system. Volume 1: Data collection and reduction
[AD-A076929] N80-27306
Feedback nulling demonstration system hardware
[AD-A084013] N80-27561
Broadband metallic radome
[AD-A084663] N80-27574
Communication application of adaptive arrays
[AD-A084402] N80-27576

ANTENNA DESIGN
Very lightweight air traffic management system using an electronic scan antenna N80-27335
Theoretical studies of microstrip antennas. Volume 2: Analysis and synthesis of multi-frequency elements
[AD-A075540] N80-27589
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs — antenna design N80-27597

ANTENNA RADIATION PATTERNS
Theoretical and experimental study of the characteristics of a thin circular loop antenna above a homogeneous, dissipative half-space N80-27553
Computer prediction of large reflector antenna radiation properties
[NASA-CR-163253] N80-27556
Radiation by sources on perfectly conducting convex cylinders with an impedance surface patch
[AD-A084345] N80-27573

ANTIFERROMAGNETISM
Surface properties of antiferromagnetic metals and alloys N80-28217

ANTIREFLECTION COATINGS
Chemical, structural and optical characterization of a black chrome solar selective absorber
N80-27797

APERTURES
Adaptive techniques for large space apertures
[AD-A084631] N80-27581
SAR object changes detection study
[AD-A084630] N80-27582

APPALACHIAN MOUNTAINS (NORTH AMERICA)
The paleomagnetism of the Carboniferous strata in the northern Appalachian basin with applications toward magnetostratigraphy N80-27956

APPROACH
Study of optical techniques for indirect generation of runway approach lights
[AD-A080434] N80-27398

APPROACH CONTROL
SINTAC-C TMA: Application of SINTAC-C in the terminal area, during landing and ground taxiing — integrated navigation, traffic control, collision evoidance and communication system N80-27339

APPROACH INDICATORS
An investigation of laser lighting systems to assist aircraft landing
[AD-A077722] N80-27315
SSILS initial evaluation report. Davis-Monthan AFB, Arizona, 16-20 November 1979
[AD-A084635] N80-27320

APPROPRIATIONS
Authorizing appropriations ot the National Aeronautics and Space Administration
[HR-REPT-96-1142] N80-28242
NASA authorization, 1981, volume 4
[GPO-61-147] N80-28243

APPROXIMATION
Approximate solutions of queueing network models of computer systems N80-28086
Convergent approximations in parabolic variationally inequalities. 1: One phase Stefan problems
[AD-A083814] N80-28105
A point mapping study of dynamical systems
N80-28140

AQUICULTURE
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 — ocean farming
[PB80-157662] N80-27795

AQUIFERS
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787

ARC WELDING
Control of physical agent hazards of arc welding and cutting
[PB80-164866] N80-27705

ARCHITECTURE
Performance prediction from a computer hardware description
[AD-A083842] N80-28058

ARCHITECTURE (COMPUTERS)
A microprocessor based high speed packet switch for satellite communications
[NASA-CR-163357] N80-27557
A microprocessor based high speed packet switch for satellite communications, executive summary
[NASA-CR-163357] N80-27558
The homogeneous machine N80-27593
Computing the Euler number of image from its quadtree
[AD-A084289] N80-28113
A distance transform for images represented by quadtrees
[AD-A084290] N80-28114
A systematic approach for the design and analysis of distributed computer systems N80-28141

ARCTIC REGIONS
A discussion of artic ionograms
[AD-A083550] N80-27898

AREA NAVIGATION
The integration of area navigation and the microwave landing system N80-27337

ARGENTINA
Analysis of scanner data for crop inventories — Brazil and Argentina
[E80-10191] N80-27767

ARID LANDS
Application of geomorphic principles to environmental management in semiarid regions
[PB80-169303] N80-27908

ARIZONA
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona — Picacho Basin
[PB80-159908] N80-27788

ARMED FORCES (UNITED STATES)
US Army users outlook on air traffic management
N80-27333

ARSENIC COMPOUNDS
X-ray absorption studies of graphite intercalates and metal-ammonia solutions — arsenic fluorocomplexes and rubidium-ammonia N80-28213

ARTERIOSCLEROSIS
Experimental coronary sclerosis induced by immobilization of rabbits: A new model of arteriosclerosis
[NASA-TM-76196] N80-27990

ARTIFICIAL GRAVITY
Effect of weightlessness and artificial gravity on ion-regulating function of rat kidneys N80-27999
Semicircular canal function in rats after flight aboard the Cosmos-936 biosatellite N80-28021

ARTIFICIAL INTELLIGENCE
Procedural attachment
[AD-A084637] N80-28092
Using parallel processing for problem solving
[AD-A084638] N80-28093
Satellite and missile data generation for AIS
[AD-A084326] N80-28143

Programmable assembly research technology transfer to industry, phase 2
[PB80-164809] N80-28261

ASCENT TRAJECTORIES
STS-1 operational flight profile. Volume 3: Ascent, cycle 3
[NASA-TM-81096] N80-27411
SSV Generic OFT first stage ascent base convective heating environments
[NASA-CR-161499] N80-27630
Addendum to SSV generic OFT first stage ascent base convective heating environments
[NASA-CR-161497] N80-27631

ASTRONOMICAL COORDINATES
Activities of the Kloppenheim satellite observation station
[SER-B-230] N80-28292
The Kloppenheim satellite observation station: Determination of longitude, latitude, and astronomical azimuth with the passage instrument ap 70
N80-28293
Determination of astronomical coordinates at the Kloppenheim satellite observation station using the circumzenithal astrolabe VUGTK; for the period 1972 to 1975 N80-28294

ASTRONOMICAL PHOTOMETRY
Low surface brightness spiral galaxies
N80-28264
Broadband photometry of galaxies in two distant clusters with a charge-coupled device camera
N80-28270

ASTRONOMICAL SPECTROSCOPY
Stellar extreme ultraviolet spectroscopy
N80-28265
Airborne infrared spectroscopy of ionized hydrogen regions and the galactic center N80-28266

ASTROPHYSICS
HI shells in the galaxy N80-28267
On the stability and dynamics of disk galaxies: Considerations on the axisymmetric background
N80-28277

ASYMPTOTES
Doubly-asymptotic, boundary-element analysis of nonlinear soil structure interaction
[AD-A083330] N80-27529

ASYMPTOTIC METHODS
CHEMEQ: A subroutine for solving stiff ordinary differential equations
[AD-A083545] N80-28097
Singularly perturbed equations in the critical case --- asymptotic expansions of solutions of boundary value problems
[AD-A083821] N80-28133

ATLANTIC OCEAN
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794
Bottom-water temperature trends in the Middle Atlantic Bight during spring and autumn, 1964-76
[PB80-166200] N80-27977

ATMOSPHERIC BOUNDARY LAYER
Marine boundary layer sampling, flight no. 2
[AD-A083158] N80-27900

ATMOSPHERIC CHEMISTRY
Effects of impulsive heating events on F-region chemistry and electron density
[AD-A083333] N80-27902

ATMOSPHERIC CIRCULATION
Atmospheric models --- data requirements
N80-27740
Global wind determination by interferometric techniques in the troposphere stratosphere and mesosphere N80-27759
The kinetic energy climatology of tropospheric and lower stratospheric flow regimes associated with 500 MB intermediate and short waves over North America N80-27863
Overview of the climate modeling program
N80-27918
Review of atmospheric general circulation models
N80-27919
Preliminary atmospheric simulation with the third-generation NCAR general circulation model: January and July N80-27922
Performance of the Oregon State University two-level atmospheric general circulation model
N80-27923
Comparisons of observed seasonal climate features with a winter and summer numerical simulation produced with the GLAS general circulation model
N80-27924
The Meteorological Office 5-layer general circulation model --- sea surface parameters N80-27925
A simulation of the January global circulation using a spectral model N80-27926
Numerical simulation of the global circulation of the atmosphere --- hydrodynamics N80-27927
Simulation of January climate with a general circulation model --- realization of baroclinic instability as well as interaction between the oceans and the atmosphere N80-27928
The atmospheric general circulation model
N80-27929
Response of the NCAR general circulation model to changed ocean surface temperature N80-27930
Statistical assessments of sea temperature anormaly experiments --- effects of sea surface temperature anomalies on the atmosphere
N80-27931
Effect of a Pacific sea-surface temperature anomaly on the circulation over North America: A numerical experiment with the GLAS model N80-27932
A simple model of the atmospheric response to a tropical sea-surface temperature anomaly
N80-27933
General circulation model experiments using glacial period and related boundary conditions N80-27934
The response of the Goddard general circulation model to sea ice boundary conditions N80-27935
Response of the NCAR general circulation model to changed land surface albedo N80-27936
Sampling considerations in estimating second moment climate quantities N80-27937
Verification of parameterizations in climate modeling N80-27942
Experiments with some simple zonal average and long wave atmospheric models N80-27946
Performance of the Lawrence Livermore Laboratory zonal atmospheric model --- a general circulation model N80-27947
A severely truncated spectral model N80-27948
Transports by nonlinear baroclinic waves
N80-27949
Views of the future development, application and validation of general circulation models N80-27957
Some personal views on the use of general circulation models N80-27958

ATMOSPHERIC COMPOSITION
Atmospheric structure and composition --- stratosphere/troposphere interactions N80-27737
Composition of the middle atmosphere: Status and priorities --- for research using satellites N80-27751
Remote measurements of air pollutants
[PB80-164791] N80-27852
Rocket borne composition measurements of the lower thermosphere with a new type of instrumentation: Auroral secondary electron energy spectra measured with a new form of cylindrical analyzer N80-27865
High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements
[NASA-CP-2134] N80-27866
Executive summary of the Workshop on High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements N80-27867
The influence of NO and ClO variations at twilight on the interpretation of solar occultation measurements N80-27868
An experiment concept to measure stratospheric trace constituents by laser heterodyne spectroscopy
N80-27869
Review of spectroscopic data for measurement of stratospheric species N80-27870

ATMOSPHERIC DIFFUSION
Atmospheric structure and composition --- stratosphere/troposphere interactions N80-27737

ATMOSPHERIC HEAT BUDGET
Radiation balance and radiation processes
N80-27735
Radiative transfer in the cloudy and dusty atmosphere N80-27743
Energy transport in the Earth-atmosphere system and the radiation balance N80-27744
Sampling problems and radiation budgets: Data requirements N80-27746
Models of the ocean circulation and the global heat balance N80-27920

ATMOSPHERIC MODELS
Atmospheric models --- data requirements
N80-27740
Air Resources Laboratories Atmospheric Transport And Dispersion model (ARL-ATAD)
[PB80-163652] N80-27853
Numerical simulation of hurricanes using radar and satellite-derived rainfall N80-27910
Climate Models: Performance, intercomparison and sensitivity studies, volume 1 --- conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-1] N80-27917
Overview of the climate modeling program
N80-27918
Review of atmospheric general circulation models
N80-27919
Climate simulations with spectral models of the atmosphere: Effect of spectral truncation
N80-27921
Preliminary atmospheric simulation with the third-generation NCAR general circulation model: January and July N80-27922
Performance of the Oregon State University two-level atmospheric general circulation model
N80-27923
Comparisons of observed seasonal climate features with a winter and summer numerical simulation produced with the GLAS general circulation model
N80-27924
The Meteorological Office 5-layer general circulation model --- sea surface parameters N80-27925
A simulation of the January global circulation using a spectral model N80-27926
Numerical simulation of the global circulation of the atmosphere --- hydrodynamics N80-27927
Simulation of January climate with a general circulation model --- realization of baroclinic instability as well as interaction between the oceans and the atmosphere N80-27928
The atmospheric general circulation model
N80-27929
Response of the NCAR general circulation model to changed ocean surface temperature N80-27930
Statistical assessments of sea temperature anormaly experiments --- effects of sea surface temperature anomalies on the atmosphere
N80-27931
Effect of a Pacific sea-surface temperature anomaly on the circulation over North America: A numerical experiment with the GLAS model N80-27932
A simple model of the atmospheric response to a tropical sea-surface temperature anomaly
N80-27933
General circulation model experiments using glacial period and related boundary conditions N80-27934
The response of the Goddard general circulation model to sea ice boundary conditions N80-27935
Response of the NCAR general circulation model to changed land surface albedo N80-27936
Sampling considerations in estimating second moment climate quantities N80-27937
Climate models: Performance, intercomparison and sensitivity studies, Volume 2 --- conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-2] N80-27938
Simple seasonal climate models --- seasonal temperature field N80-27941
Verification of parameterizations in climate modeling N80-27942
The performance of a seasonal global climatic model --- seasonal cycle of the temperature N80-27944
Equilibrium climatic zonation deduced from a statistical-dynamical model N80-27945
Experiments with some simple zonal average and long wave atmospheric models N80-27946
Performance of the Lawrence Livermore Laboratory zonal atmospheric model --- a general circulation model N80-27947
A severely truncated spectral model N80-27948
Transports by nonlinear baroclinic waves
N80-27949
An energy-balance model of glaciation cycles
N80-27950
A simple sea-ice/ocean-temperature oscillator model N80-27951
Influence of airborne particles on the earth's radiation balance N80-27953
Harmonic analysis of feedbacks: A transfer function climate model N80-27954

Climate experiments: Albedo experiments with a zonal atmospheric model N80-27955
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models --- latitudinal variation N80-27956
Views of the future development, application and validation of general circulation models N80-27957
Some personal views on the use of general circulation models N80-27958
Some comments on the design of model response experiments for multi-time-scale systems N80-27959

ATMOSPHERIC PRESSURE
A microwave pressure sounder for the remote measurement of atmospheric surface pressure N80-27758

ATMOSPHERIC RADIATION
Influence of airborne particles on the earth's radiation balance N80-27953

ATMOSPHERIC SCATTERING
Radiative transfer in the cloudy and dusty atmosphere N80-27743
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
Light scattering in a spherical planetary atmospheres, with applications to Venus N80-28284

ATMOSPHERIC TEMPERATURE
Satellite measurements of atmospheric temperature N80-27749
The interannual variability of the stratosphere N80-27750
Methods and problems in satellite temperature profiles and winds --- vertical temperature and wind profiles N80-27756

ATMOSPHERIC TURBULENCE
Accuracy of aircraft velocities from inertial navigation systems for application to airborne wind measurements
[NASA-TM-81826] N80-27913

ATOMIC COLLISIONS
Inelastic collisions of excited atoms
[AD-A084524] N80-28172
Photochemical consequences of interchromophoric interactions
[AD-A084712] N80-28173
Crossed molecular beam study of the reactions of oxygen and fluorine atoms
[AD-A084255] N80-28174

ATOMIC EXCITATIONS
Inelastic collisions of excited atoms
[AD-A084524] N80-28172
Photochemical consequences of interchromophoric interactions
[AD-A084712] N80-28173

ATOMIC STRUCTURE
Conformation, electronic structure and reactivity as probed by photoelectron spectroscopy N80-27444
Determination of morphology and electronic structure in solids with 20-1000 eV radiation N80-28206

ATOMS
Multiphoton processes in isolated atoms and molecules N80-28164

ATTITUDE (INCLINATION)
An attitude acquisition technique for dual-spin spacecraft --- spacecraft rotor alignment N80-27417

ATTITUDE CONTROL
The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419

AUDITORY PERCEPTION
The effects of high level infrasound
[AD-A081792] N80-28159

AUDITORY STIMULI
Nonlinearities in auditory-nerve fiber responses to bandlimited noise: An experimental study and a model N80-28037

AUGER SPECTROSCOPY
Electron spectroscopy studies of clean oxide surfaces, chemisorbed molecules and photo-assisted surface processes N80-28211

AURORAL ECHOES
Spectra from 50 MHz auroral radar echoes N80-27547

AURORAL IONIZATION
Low-energy plasma in the dayside auroral zone N80-27861

AURORAL SPECTROSCOPY
Spectra from 50 MHz auroral radar echoes N80-27547

AURORAL ZONES
Low-energy plasma in the dayside auroral zone N80-27861
A discussion of artic ionograms
[AD-A083550] N80-27898
A method for direct determination of real height from virtual height data for the auroral region of the ionosphere
[AD-A083139] N80-27899

AUSTENITE
The microstructural behavior of austenite due to hot rolling N80-27471

AUSTRIA
Noise levels near streets, effectiveness and cost abatement measures
[NASA-TM-75814] N80-27834

AUTOMATIC CONTROL
Air traffic control automation: Its impact and use in the selection and screening of air traffic controllers N80-27329
Midair conflicts and their potential avoidance by progressive implementation of automation N80-27331

AUTOMATIC FLIGHT CONTROL
Shuttle program. MCC level C formulation requirements: Shuttle TAEM guidance and flight control
[NASA-TM-81094] N80-27409

AUTOMATIC PILOTS
Shuttle program. MCC Level C formulation requirements: Entry guidance and entry autopilot
[NASA-TM-81093] N80-27408

AUTOMOBILE ACCIDENTS
National crash severity study statistics
[PB80-16040] N80-28258

AUTOMOBILE ENGINES
Effect of ambient temperature on vehicle emissions and performance factors
[PB80-162753] N80-27704

AUTOMOBILES
Phase 1 of the near term hybrid passenger vehicle development program
[NASA-CR-163219] N80-28245
Phase 1 of the near term hybrid passenger vehicles development program. Appendix A: Mission analysis and performance specification studies, volume 1
[NASA-CR-163220] N80-28246
Phase 1 of the near term hybrid passenger vehicle development program, appendix A. Mission analysis and performance specification studies. Volume 2: Appendices
[NASA-CR-163221] N80-28247
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies, volume 1
[NASA-CR-163222] N80-28248
Phase 1 of the near team hybrid passenger vehicle development program. Appendix C: Preliminary design data package, volume 1
[NASA-CR-163223] N80-28249
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies. Volume 2: Appendices
[NASA-CR-163224] N80-28250
Phase 1 of the near team hybrid passenger vehicle development program. Appendic C: Preliminary design data package. Volume 2: Appendices
[NASA-CR-163225] N80-28251
Phase 1 of the near term hybrid passenger vehicle development program. Appendix D: Sensitivity analysis
[NASA-CR-163226] N80-28252

AUXILIARY POWER SOURCES
Solar energy system performance evaluation-seasonal report for Elcam San Diego, San Diego, California
[NASA-CR-161481] N80-27806

AVALANCHE DIODES
IC Ku-Band impatt amplifier --- solid state spacecraft transmitter
[NASA-CR-160004] N80-27601
The 140 GHz pulsed impatt combiner high power source
[AD-A083450] N80-27606

AVIONICS
General aviation pilot and aircraft activity survey, conducted in 1978
[AD-A081726] N80-27276
The development and test of a tactical self-contained landing system --- landing military helicopters when the safe corridor is unknown N80-27334
Evolution and transition of today's military landing system to compatibility with present and future civil military systems --- multimode receivers and the marine remote area approach landing system N80-27339
Some aspects of application of the systemic approach to aviation engineering psychology N80-28002

AXES OF ROTATION
An attitude acquisition technique for dual-spin spacecraft --- spacecraft rotor alignment N80-27417

AXIAL FLOW
Documentation of cascade unsteady pressure difference program
[AD-A083987] N80-27368

AXIAL FLOW TURBINES
Numerical calculation of transonic axial turbomachinery flows
[NASA-TM-81544] N80-27363

AXIAL LOADS
Axial and radial compression of ion beams
[AD-A083702] N80-28171

AXISYMMETRIC BODIES
An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390
On the stability and dynamics of disk galaxies: Considerations on the axisymmetric background N80-28277

AXISYMMETRIC FLOW
Three-dimensional turbulent boundary layer: Restructuration of an axisymetric flow subjected to a discontinuity of the wall peripheral velocity N80-27666

AZULENE
Synthesis and characterization of metallo-organic conducting materials with tetraazaannulenes
[AD-A083765] N80-27454

B

BACKGROUND NOISE
Correction procedures for aircraft noise data. Volume 2: Background noise considerations
[AD-A082011] N80-28158

BACKSCATTERING
Backscattering of electromagnetic waves from a layer of vegetation
[AD-A083922] N80-27565
Gradient scattering theory demonstrates that VHF, spread-F radar backscatter reveals streaming instabilities
[AD-A084644] N80-27571

BALANCE
Force balancing machines and optimization of dynamic relations for planar mechanisms N80-27693

BALL BEARINGS
Stresses and deformations in elliptical contacts
[NASA-TM-81535] N80-27697

BALLISTIC TRAJECTORIES
Muzzle blast overpressure levels on the AH-1S helicopter tow sight unit
[AD-A084027] N80-27352

BALLISTICS
Conceptual design study for Coherent Anti-Stokes Raman Spectroscopy (CARS) diagnostics in the AMMRC ballistic compressor facility
[AD-A083492] N80-27453

BALLOONS
Lighter than air vehicles. Citations from the NTIS data base
[PB80-808066] N80-27298
Lighter than air vehicles. Citations from the Engineering Index data base
[PB80-808074] N80-27299

BALTIC SEA
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

BANDPASS FILTERS
Broadband metallic radome
[AD-A084663] N80-27574
BANDWIDTH
Nonlinearities in auditory-nerve fiber responses to bandlimited noise: An experimental study and a model N80-28037
BAROCLINIC WAVES
Simulation of January climate with a general circulation model — realization of baroclinic instability as well as interaction between the oceans and the atmosphere N80-27928
Experiments with some simple zonal average and long wave atmospheric models N80-27946
Transports by nonlinear baroclinic waves N80-27949
BAROTROPIC FLOW
A simple model of the atmospheric response to a tropical sea-surface temperature anomaly N80-27933
Transports by nonlinear baroclinic waves N80-27949
BAYES THEOREM
New algorithms for nonlinear least squares and Bayesian parameter estimation
[AD-A[illegible]] N80-28110
BEAMS (RADIATION)
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170
BEAMS (SUPPORTS)
Serviceability and reliability analysis of partially prestressed concrete beams N80-27716
Instructions for the use of the CIVM-Jet 4C finite-strain computer code to calculate the transient structural responses of partial and/or complete arbitrarily-curved rings subjected to fragment impact
[NASA-CR-159873] N80-27720
Free vibrations of a concentric circular conical beam with a concentric circular cylindrical bore
[AD-A083292] N80-27724
BEDS (PROCESS ENGINEERING)
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Startup and initial feasibility testing on the Salem Harbor COM demonstration N80-27499
Operation of a central preparation plant for coal-oil-water mixtures N80-27500
Investigations of coal-oil mixtures as a utility boiler light-off fuel N80-27501
Pilot plant test on coarse COM system. Tests on transportation, de-oiling and combustion of coarse COM N80-27508
Coal gasification technology. Citations from the NTIS data center
[PB80-808082] N80-27527
BENDING FATIGUE
Bending stress and frequency calculations for the bearing-pack shaft — drills
[SAND-80-7030] N80-27729
BIBLIOGRAPHIES
Lighter than air vehicles. Citations from the NTIS data base
[PB80-808066] N80-27298
Lighter than air vehicles. Citations from the Engineering Index data base
[PB80-808074] N80-27299
Discrete address beacon system. Citations from the NTIS data base
[PB80-807522] N80-27322
Ablation and ablative materials. Citations from the NTIS data base
[PB80-807837] N80-27438
Coal gasification technology. Citations from the NTIS data base
[PB80-808090] N80-27525
Coal liquefaction technology. Citations from the NTIS data base
[PB80-808106] N80-27526
Coal gasification technology. Citations from the NTIS data center
[PB80-808082] N80-27527
Microwave oscillators. Citations from the NTIS data base
[PB80-808280] N80-27616
Microwave oscillators. Citations from the Engineering Index data base
[PB80-808298] N80-27617
Holographic flow visualization. Citations from the NTIS data base
[PB80-808199] N80-27681
Stress crack phenomena. Citations from the NTIS data base
[PB80-807886] N80-27730
Stress crack phenomena. Citations from the NTIS data base
[PB80-807878] N80-27731
Solar process heat. Citations from the NTIS data base
[PB80-807936] N80-27823
Biological effects of microwaves. Citations from the NTIS data base
[PB80-808256] N80-28050
Toxicity of vinyl chloride. Citations from the NTIS data base
[PB80-807662] N80-28051
Altitude hypoxia. Citations from the NTIS data base
[PB80-807696] N80-28052
Interactive computer graphics. Citations from the NTIS data base

Cosmic Rays. Citations from the NTIS data base
[PB80-807647] N80-28291
BINARY ALLOYS
The critical points of alloys of iron and cobalt during rapid heating
[NASA-TM-75825] N80-27473
Iron-based alloys strengthened by ternary Laves phases — precipitation hardening
[PB80-157233] N80-27480
BINARY CODES
A path-length distance transform for quadtrees
[AD-A084293] N80-28072
BIOASSAY
Isolation and gas chromatographic demonstration of volatile organic substances in thin-layer biological samples N80-28014
BIOCHEMISTRY
Biochemical bases of pathogenesis of hypokinesia N80-27995
BIOELECTRICITY
Bioelectric activity of the human brain during and after 182-day anitorthostatic hypokinesia N80-28027
BIOLOGICAL EFFECTS
USSR Report: Space Biology and Aerospace Medicine, volume 14, no. 3, 1980
[JPRS-75956] N80-27994
USSR Report. Space Biology and Aerospace Medicine, volume 14, no.2, 1980
[JPRS-75654] N80-28015
Research hardware and habitat of animals used in experiment aboard Cosmos-936 biosatellite N80-28019
Biological effects of microwaves. Citations from the NTIS data base
[PB80-808256] N80-28050
BIOMASS
Catalytic liquefaction of biomass
[LBL-10091] N80-27520
Study of compatilibity of certain higher plants and chlorella as related to a bioregenerative human life support system N80-28033
BIOMASS ENERGY PRODUCTION
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T2] N80-27514
Hydrolyzed wood slurry flow modeling — hydrocarbon fuel production
[LBL-10090] N80-27703
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 — ocean farming
[PB80-157662] N80-27795
BIOMETRICS
Effect of immobilization on the EEG of the baboon. Comparison with telemetry results from unrestricted animals
[NASA-TM-76137] N80-27987
BIOSYNTHESIS
The biosynthesis of natural rubber and other hydrocarbon polymers N80-27482
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9909] N80-27521
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9220] N80-27522
BIRDS
The growth of birdwings
[NASA-TM-75821] N80-27986
BIREFRINGENCE
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
BIVARIATE ANALYSIS
Multicharacteristic quality control: A survey
[AD-A083894] N80-27708
Generalized network approaches for solving least absolute value and Tchebycheff regression problems
[AD-A084284] N80-28121
A general mixture-truncation method for generating bivariate random variables from univariate generators
[AD-A084474] N80-28138
BLACK HOLES (ASTRONOMY)
Star clusters containing massive, central black holes: Evolution calculations N80-28275
BLOOD CIRCULATION
Circulation in exercising crew members of the first main expedition aboard Salyut-6 N80-27997
Hemodynamics and phase structure of the cardiac cycle in members of the first crew of Salyut-5 at rest — effects of hypokinesia and weightlessness N80-27996
Effect of prolonged +Gz accelerations on human performance N80-28003
Studies of prognostic significance of antiorthostatic position N80-28006
Regional redistribution of rat blood after 7 and 30 days of hypokinesia N80-28009
Method for assessing hemodynamics and detecting latent insufficiency of cerebral circulation in cosmonaut candidates N80-28012
Circulation at rest in crew members of the first main expedition aboard Salyut 6 N80-28017
BLOOD COAGULATION
Effects of hypodynamia on the hemocoagulative properties of the vascular wall and myocardium
[NASA-TM-76199] N80-27992
BLOOD FLOW
Results of studies of pulsed blood flow and regional vascular tonus during flights in the first and second expeditions aboard the Salyut-6-Soyuz orbital complex — effects of weightlessness N80-27996
BLOOD VESSELS
Displacement of plasma protein and conduction velocity in rats under action of acceleration forces and hypokinesia
[NASA-TM-76195] N80-27989
Effects of hypodynamia on the hemocoagulative properties of the vascular wall and myocardium
[NASA-TM-76199] N80-27992
BLOOD VOLUME
Regional redistribution of rat blood after 7 and 30 days of hypokinesia N80-28009
BODIES OF REVOLUTION
Modelling requirements for the calculation of the turbulent flow around airfoils, wings and bodies of revolution N80-27663
BODY FLUIDS
Instrumentation for the measurement of viscosity and flow of biological fluids — neuclear magnetic resonance N80-27980
Mechanisms of water-salt metabolism disturbances in dogs subjected to six month hypokinesia
[NASA-TM-76170] N80-27984
BODY KINEMATICS
The stress reaction to hypokinesia and its effect on general resistance N80-28008
BODY MEASUREMENT (BIOLOGY)
The growth of birdwings
[NASA-TM-75821] N80-27986

BODY-WING AND TAIL CONFIGURATIONS
Exploratory studies of the cruise performance of upper surface blown configurations --- wind tunnel tests
[NASA-CR-3193] N80-27281
BOILERS
Mathematical modeling of boiler operations
N80-27391
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Investigations of coal-oil mixtures as a utility boiler light-off fuel N80-27501
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
BOLTZMANN TRANSPORT EQUATION
The Boltzman equation with a soft potential. Part 2: Nonlinear, spatially-periodic
[AD-A083613] N80-28099
BONDING
Development of a rebar dowel anchorage system for attaching the California type 25 concrete barrier to existing bridges
[PB80-161722] N80-27534
BONE MINERAL CONTENT
State of human bone tissue protein fraction after space flights N80-28018
BOUNDARIES
Doubly-asymptotic, boundary-element analysis of nonlinear soil structure interaction
[AD-A083330] N80-27529
BOUNDARY LAYER FLOW
A second order accurate numerical method for supersonic boundary layer flow past a compression corner
[AD-A084550] N80-27294
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction
[AD-A083703] N80-27639
An investigation of the structure of equilibrium turbulent boundary layers N80-27653
Equilibrium boundary layers over very rough surfaces N80-27654
Turbulence behavior in a shock wave/boundary layer interaction N80-27655
Boundary layer measurements on a two-dimensional wing with flap and a comparison with calculations
N80-27665
Experimental results concerning the influence of transition processes on the initial structure of a turbulent boundary layer N80-27668
Some measurements in synthetic turbulent boundary layers N80-27669
Flow visualization of turbulent boundary layer structure N80-27671
Some observations of the structure of the turbulent boundary layer N80-27672
BOUNDARY LAYER SEPARATION
Colloquim on flow separation
[AD-A083741] N80-27636
BOUNDARY LAYER TRANSITION
Numerical solutions for laminar boundary layer behind blast waves
[AD-A084435] N80-27644
Experimental results concerning the influence of transition processes on the initial structure of a turbulent boundary layer N80-27668
BOUNDARY LAYERS
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
Finite element analysis of transonic flows
[AD-A084636] N80-27295
Longitudinal vortices in concave surface boundary layer N80-27656
Boundary layer measurements on a two-dimensional wing with flap and a comparison with calculations
N80-27665
A boundary layer theory for the anisotropic plate
[AD-A083265] N80-27726
Response to subtropical marine boundary-layer cloudiness to large-scale forcing N80-27909
A model of a suspended sediment induced, stably stratified oceanic bottom boundary layer
N80-27974
BOUNDARY VALUE PROBLEMS
Exterior-interior aperture coupling of a rectangular cavity with wire obstacle
[AD-A084258] N80-27586
The solution of boundary value problems in diffusive heat and mass transfer with convection: Functional analytic methods N80-27627
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083871] N80-27723
The boundary integral equation method applied to free surface flow problems in porous media
N80-27762
High order difference methods for quasilinear elliptic boundary value problems on general regions
[AD-A083824] N80-28102
Analysis of computational methods for nonlinear parabolic differential systems
[AD-A084236] N80-28122
Singularly perturbed equations in the critical case --- asymptotic expansions of solutions of boundary value problems
[AD-A083821] N80-28133
BRAIN
Studies of prognostic significance of antiorthostatic position N80-28006
BRAIN CIRCULATION
Method for assessing hemodynamics and detecting latent insufficiency of cerebral circulation in cosmonaut candidates N80-28012
BRANCHING (MATHEMATICS)
A point mapping study of dynamical systems
N80-28140
BRANCHING (PHYSICS)
Tables of transition probabilities and branching ratios for electric dipole transmissions between arbitrary levels of hydrogen-like atoms
[NASA-TM-80682] N80-28167
BRAZIL
Analysis of scanner data for crop inventories --- Brazil and Argentina
[E80-10191] N80-27767
BRIDGES (STRUCTURES)
Development of a rebar dowel anchorage system for attaching the California type 25 concrete barrier to existing bridges
[PB80-161722] N80-27534
BRIGHTNESS TEMPERATURE
Snowpack monitoring in North America and Eurasia using passive microwave satellite data
[NASA-TM-80706] N80-27779
Remote sensing of soil moisture content over bare fields at 1.4 GHz frequency
[NASA-TM-80711] N80-27780
BRILLOUIN EFFECT
Wavefront reproduction by stimulated Brillouin and Raman scattering N80-27685
BROADBAND
Broadband metallic radome
[AD-A084663] N80-27574
BROADCASTING
High capacity low delay packet broadcasting multiaccess schemes for satellite repeater systems
N80-27548
Sharing of the band 12.2-12.7 GHz between the braodcasting-satellite and fixed services
[PB80-157423] N80-27590
BUILDINGS
Analysis of code related responses from the solar demonstration program
[PB80-153968] N80-27827
BUOYS
Analysis of meteorological observations from an array of buoys during JASIN
[AD-A084034] N80-27960
BURNING RATE
Rocket research at Georgia Tech.
[AD-A083764] N80-27425

C

CADMIUM
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170
CADMIUM SELENIDES
Investigation of cadmium selenide photoelectrochemical cells
[AD-A083690] N80-27815
CALCIUM METABOLISM
State of rat thyroid C cells following flights on the Cosmos type of biosatellites (according to results of a morphological study) --- effects of weightlessness
N80-28001
CALCULUS
Contingent derivatives of set-valued maps and solutions to nonlinear inclusions and differential inclusions
[AD-A083826] N80-28108
CALCULUS OF VARIATIONS
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083871] N80-27723
CALIFORNIA
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 --- ocean farming
[PB80-157662] N80-27795
CAMBER
The low-speed characteristics of a 15-percent quasi-elliptical circulation control airfoil with distributed camber
[AD-A084176] N80-27292
CANADA
Current status of the Canadian coal-oil mixture program N80-27496
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 --- ocean farming
[PB80-157662] N80-27795
CAP CLOUDS
Mountain overflow phenomena in satellite imagery
N80-27754
CAPE KENNEDY LAUNCH COMPLEX
A continuation of base-line studies for environmentally monitoring space transportation systems at John F. Kennedy Space Center. Executive summary
[NASA-CR-163122] N80-27836
CARBOHYDRATE METABOLISM
Effect of hypokinesia on changes in carbohydrate and lipid metabolism in the heart and liver
N80-28029
CARBON
The combustion of carbon, coal and coal related fuels in an opposed flow diffusion flame burner
N80-27493
Carbon slurry fuels for volume limited missiles
[AD-A084710] N80-27512
CARBON DIOXIDE
Zonal and seasonal radiative effects of a doubling of atmospheric carbon dioxide concentration --- heating of the surface and troposphere N80-27952
CARBON DIOXIDE LASERS
Optical performance analysis of CO2 laser fusion systems N80-27684
A multiple pulse CO2 tea laser for use in thermal blooming studies
[AD-A083930] N80-27687
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
CARBON MONOXIDE
A 346 GHz heterodyne receiver and its use in observations of carbon monoxide in interstellar clouds N80-28268
CARBON MONOXIDE LASERS
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
CARBON-CARBON COMPOSITES
Shape change of Galileo probe models in free-flight tests
[NASA-TM-81209] N80-27418
CARBONACEOUS CHONDRITES
Photometric properties of carbonaceous chondrites and related materials N80-28283
CARDIOVASCULAR SYSTEM
Circulation at rest in crew members of the first main expedition aboard Salyut 6 N80-28017
Functional state of the cardiovascular system under the combined effect of 28 day immersion, rotation on a short-arm centrifuge and exercise on a bicycle ergometer N80-28025

Cardiovascular and respiratory physiopathological aspects of hypokinesia
[NASA-TM-76198] N80-28048

CARGO AIRCRAFT
Lighter than air vehicles. Citations from the NTIS data base
[PB80-808066] N80-27298
Lighter than air vehicles. Citations from the Engineering Index data base
[PB80-808074] N80-27299
The development of the zepplin dirigible for long distance transportation
[NASA-TM-76143] N80-27303
Measures for improving the zeppelin airships for long distance transportation
[NASA-TM-76142] N80-27351

CARRIER WAVES
Feasibility of offset carrier systems for air traffic control
[AD-A084044] N80-27309

CASCADE FLOW
CAS2D: FORTRAN program for nonrotating blade-to-blade, steady, potential transonic cascade flows
[NASA-TP-1705] N80-27284
Time-variant aerodynamics for torsional motion of large-turning airfoils
[AD-A083766] N80-27289

CASTING
Fatigue behavior of Hercules 3501-6 epoxy resin
[AD-A083494] N80-27487

CATALYSIS
Catalytic liquefaction of biomass
[LBL-10091] N80-27520

CATECHOLAMINE
The content of catecholamines in the adrenal glands and sections of the brain under hypokinesia and injection of some neurotropic agents
[NASA-TM-76010] N80-28044

CATEGORIES
Contingency tables
[AD-A084262] N80-28134

CATHODES
Contiguous gridded gun development program
[AD-A084046] N80-27608

CATTLE
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774

CAVITATION CORROSION
Cavitation damage mechanisms: Review of literature
[AD-A083805] N80-27638

CELESTIAL MECHANICS
Shuttle program. Onorbit navigation integrator results for typical shuttle orbits
[NASA-TM-81092] N80-27407

CELLULOSE
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9909] N80-27521
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9220] N80-27522

CENTRAL NERVOUS SYSTEM
Bioelectric activity of the human brain during and after 182-day anitorthosatic hypokinesia N80-28027

CENTRAL NERVOUS SYSTEM DEPRESSANTS
Effect of central neurotropic substances on the hypophysisadrenal cortex system during immobilization of animals
[NASA-TM-76158] N80-27982

CENTRAL PROCESSING UNITS
Hybrid image processing system
[AD-A084563] N80-28070

CENTRIFUGING STRESS
Functional state of the cardiovascular system under the combined effect of 28 day immersion, rotation on a short-arm centrifuge and exercise on a bicycle ergometer N80-28025

CERAMIC COATINGS
Composite wall concept for high temperature turbine shrouds: Heat transfer analysis
[NASA-TM-81539] N80-27362
Effect on combined cycle efficiency of stack gas temperature constraints to avoid acid corrosion
[NASA-TM-81531] N80-27804

CERAMICS
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N48w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484

CHANNEL CAPACITY
On the spatial capacity of packet radio networks N80-27549

CHANNEL FLOW
Evidence for instability-waves in the velocity-field of a fully developed turbulent channel-flow N80-27667

CHANNELS
Communication over a quantum channel with feedback N80-27552

CHARGE COUPLED DEVICES
Development of test structures for characterization of the fabrication and performance of radiation-hardened Charge-Coupled Device (CCD) imagers
[PB80-160708] N80-27613
Broadband photometry of galaxies in two distant clusters with a charge-coupled device camera N80-28270

CHEMICAL ANALYSIS
Structure of complexes between aluminum chloride and other chlorides, 2: Alkali-(chloroaluminates). Gaseous complexes
[NASA-TM-75762] N80-27452
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N48w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484

CHEMICAL CLOUDS
A 346 GHz heterodyne receiver and its use in observations of carbon monoxide in interstellar clouds N80-28268

CHEMICAL COMPOSITION
Saturated atomic fluorescence as a diagnostic tool for flames and plasmas N80-27439
Adsorption of trace metals by hydrous ferric oxide in sea water
[PB80-152804] N80-27463
The embrittlement of alloys under impulse thermal, pressure and chemical conditions
[AD-A083743] N80-27476

CHEMICAL LASERS
Computer modeling of pulsed chemical lasers
[AD-A083648] N80-27686

CHEMICAL PROPERTIES
Chemical, structural and optical characterization of a black chrome solar selective absorber N80-27797
The effects of surface phenomena on the spreading of oil on water
[PB80-163629] N80-27850

CHEMICAL REACTIONS
Theoretical study of a reaction-diffusion model for flame propagation in a gas N80-27440
Conformation, electronic structure and reactivity as probed by photoelectron spectroscopy N80-27444
The kinetics and mechanism of the formation of ozone by the anodic oxidation of water N80-27445
Low energy ion molecule reactions in chemical ionization by mass-analyzed ion kinetic energy spectrometry N80-27448
Structure of complexes between aluminum chloride and other chlorides, 2: Alkali-(chloroaluminates). Gaseous complexes
[NASA-TM-75762] N80-27452
Synthesis and characterization of metallo-organic conducting materials with tetraazaannulenes
[AD-A083765] N80-27454

CHEMICAL REACTORS
Coalescence/dispersion modelling of gas turbine combustors N80-27384
A chemical reactor model and its application to a practical combustor N80-27392
Coal gasification technology. Citations from the NTIS data base
[PB80-808090] N80-27525

CHEMISORPTION
Infrared study of hydrogen chemisorbed on W(100) by surface electrommagnetic wave spectroscopy N80-27554
Electron spectroscopy studies of clean oxide surfaces, chemisorbed molecules and photo-assisted surface processes N80-28211

CHINA
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497

CHLORELLA
Study of compatilibity of certain higher plants and chlorella as related to a bioregenerative human life support system N80-28033

CHLORINE OXIDES
The influence of NO and ClO variations at twilight on the interpretation of solar occultation measurements N80-27868

CHROMIUM
The sulfidation behavior of nickel-chromium, nickel-aluminum, and nickel-chromium-aluminum alloys with and without yttrium N80-27466
Chemical, structural and optical characterization of a black chrome solar selective absorber N80-27797

CHROMIUM ALLOYS
Beta decomposition in binary Ti-Cr alloys N80-27469

CHROMIUM COMPOUNDS
Photochemical consequences of interchromophoric interactions
[AD-A084712] N80-28173

CHROMIUM STEELS
An investigation of the microstructure and mechanical properties of thick section Cr-Mo steels N80-27467

CHROMOSPHERE
Rocket studies of solar corona and transition region --- X-Ray spectrometer/spectrograph telescope
[NASA-CR-160001] N80-28288

CIRCLES (GEOMETRY)
Random coverage of a circle with application to a shadowing problem
[AD-A084357] N80-28139

CIRCULATION CONTROL AIRFOILS
The low-speed characteristics of a 15-percent quasi-elliptical circulation control airfoil with distributed camber
[AD-A084176] N80-27292

CIRCULATORY SYSTEM
Circulation at rest in crew members of the first main expedition aboard Salyut 6 N80-28017

CITIES
The contribution of ozone aloft to surface ozone maxima N80-27857

CIVIL AVIATION
The general aviation dynamics model. Volume 1: Executive summary
[AD-A073543] N80-27273
The general aviation dynamic model. Volume 2: Technical report
[AD-A073544] N80-27274
FAA aviation forecastings, fiscal years 1980 - 1991
[AD-A075382] N80-27275
Current aviation statistics: Air traffic activity terminal area relationships, fiscal years 1977 and 1978
[AD-A078617] N80-27305
Air Traffic Management: Civil/Military System and Technologies --- conference
[AGARD-CP-273] N80-27324
Data link: The key to improvements in civil/military air traffic management? N80-27330
Midair conflicts and their potential avoidance by progressive implementation of automation N80-27331
Energy conservation potential of general aviation activity
[AD-A081182] N80-27355
Influence of noise reduction on weight and cost of general aviation propellers
[AD-A082120] N80-27366

CLIMATE
On Climatology, Hydrology, Atmospheric Research and Meteorology (CHARM) from Space --- conference proceedings, Ajaccio, France, 12-16 Nov. 1979
[ESA-SP-150] N80-27733
Climate and climate modeling N80-27734
Atmospheric models --- data requirements N80-27740
Climate Models: Performance, intercomparison and sensitivity studies, volume 1 --- conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-1] N80-27917
Overview of the climate modeling program N80-27918

Climate simulations with spectral models of the atmosphere: Effect of spectral truncation N80-27921
Preliminary atmospheric simulation with the third-generation NCAR general circulation model: January and July N80-27922
Performance of the Oregon State University two-level atmospheric general circulation model N80-27923
Comparisons of observed seasonal climate features with a winter and summer numerical simulation produced with the GLAS general circulation model N80-27924
The Meteorological Office 5-layer general circulation model --- sea surface parameters N80-27925
General circulation model experiments using glacial period and related boundary conditions N80-27934
The response of the Goddard general circulation model to sea ice boundary conditions N80-27935
Response of the NCAR general circulation model to changed land surface albedo N80-27936
Climate models: Performance, intercomparison and sensitivity studies, Volume 2 --- conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-2] N80-27938
Simple seasonal climate models --- seasonal temperature field N80-27941
Verification of parameterizations in climate modeling N80-27942
Recent work on heat-balance models N80-27943
The performance of a seasonal global climatic model --- seasonal cycle of the temperature N80-27944
Equilibrium climatic zonation deduced from a statistical-dynamical model N80-27945
Performance of the Lawrence Livermore Laboratory zonal atmospheric model --- a general circulation model N80-27947
A severely truncated spectral model N80-27948
Zonal and seasonal radiative effects of a doubling of atmospheric carbon dioxide concentration --- heating of the surface and troposphere N80-27952
Influence of airborne particles on the earth's radiation balance N80-27953
Harmonic analysis of feedbacks: A transfer function climate model N80-27954
Climate experiments: Albedo experiments with a zonal atmospheric model N80-27955
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models --- latitudinal variation N80-27956
Some personal views on the use of general circulation models N80-27958
Some comments on the design of model response experiments for multi-time-scale systems N80-27959

CLIMATOLOGY
Space techniques --- for measuring meteorological parameters N80-27739
Ice sheets, glaciers, and climate N80-27742
The solar constant and its spectrum --- relationship to Earth's climate N80-27745
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757
Empirical studies of the relationships between emissions and visibility in the Southwest
[PB80-156136] N80-27904
Review of atmospheric general circulation models N80-27919

CLINICAL MEDICINE
Vertebral pain in helicopter pilots
[NASA-TM-75792] N80-28043

CLOSED ECOLOGICAL SYSTEMS
Study of compatibility of certain higher plants and chlorella as related to a bioregenerative human life support system N80-28033

CLOSURE LAW
The turbulent boundary layer and the closure problem N80-27664

CLOUD COVER
Radiative transfer in the cloudy and dusty atmosphere N80-27743
A cylindrical cloud model for microwave and infrared radiative transfer-applications to defense meteorological satellite program microwave sounders N80-27912

CLOUD PHOTOGRAPHY
Meteorological research and cloud parameter derivation from satellite data N80-27755
The University of Oklahoma severe storms intercept project-1979
[PB80-166010] N80-27972

CLOUD PHYSICS
Marine boundary layer sampling, flight no. 2
[AD-A083158] N80-27900
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964

CLOUDS (METEOROLOGY)
Meteorological research and cloud parameter derivation from satellite data N80-27755
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
Response to subtropical marine boundary-layer cloudiness to large-scale forcing N80-27909

COAL
Coal gasification technology. Citations from the NTIS data base
[PB80-808090] N80-27525
Dewatering systems for surface coal mines
[PB80-160153] N80-27789

COAL GASIFICATION
Coal gasification technology. Citations from the NTIS data base
[PB80-808090] N80-27525
Coal gasification technology. Citations from the NTIS data center
[PB80-808082] N80-27527
Criteria for a recommended standard: Occupational exposures in coal gasification plants
[PB80-164874] N80-27535
Recommended health and safety guidelines for coal gasification pilot plants
[PB80-164890] N80-27536

COAL LIQUEFACTION
Use of petroleum-based correlations and estimation methods for synthetic fuels
[NASA-TM-81533] N80-27509
Coal liquefaction technology. Citations from the NTIS data base
[PB80-808108] N80-27526

COAL UTILIZATION
The combustion of carbon, coal and coal related fuels in an opposed flow diffusion flame burner N80-27493
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Overview of R&D status on COM technology in Japan N80-27495
Current status of the Canadian coal-oil mixture program N80-27496
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498
Startup and initial feasibility testing on the Salem Harbor COM demonstration N80-27499
Operation of a central preparation plant for coal-oil-water mixtures N80-27500
Investigations of coal-oil mixtures as a utility boiler light-off fuel N80-27501
Coal/oil/water mixture stability, appendix A N80-27502
Stable coal/fuel oil dispersions N80-27503
Combustion of coal-oil mixtures in a 700 HP watertube boiler N80-27504
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
Design consideration of fine COM storage N80-27506
Report on pumping characteristic tests and piping pressure loss measurement tests for fine COM N80-27507
Pilot plant test on coarse COM system. Tests on transportation, de-oiling and combustion of coarse COM N80-27508
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-58] N80-27515
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-55] N80-27516
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-50] N80-27517
Coal: An alternate fuel for thermal enhanced oil recovery steam generation
[SAN-2418-1] N80-27524

COALESCING
Coalescence/dispersion modelling of gas turbine combustors N80-27364

COASTAL WATER
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

COBALT
The magnetic properties of amorphous (Fe-Ni-Co): Metalloid alloys N80-27472

COBALT ALLOYS
The critical points of alloys of iron and cobalt during rapid heating
[NASA-TM-75825] N80-27473

CODING
Image Coding: Report of a Workshop
[PB80-164817] N80-28240

COEFFICIENT OF FRICTION
The response of turbine engine rotors to interference rubs
[NASA-TM-81518] N80-27696

COHERENT LIGHT
Phase conjugate optics: On the theory, observation, and utilization of temporally-reversed wavefronts as generated via nonlinear optical parametric interactions N80-28178

COLLISION AVOIDANCE
ATARS/ATC simulation tests with site adaptation logic in the Philadelphia terminal area
[AD-A083718] N80-27308
An evaluation of aircraft separation assurance concepts using airline flight simulators. Volume 1: Study report
[AD-A083986] N80-27310
An evaluation of aircraft separation assurance concepts using airline flight simulators. Volume 2: Appendices
[AD-A083897] N80-27311
Precision navigation for air traffic management
[AD-A083947] N80-27317
Midair conflicts and their potential avoidance by progressive implementation of automation N80-27331
Determination of the safety in a North Atlantic organized track system with reduced lateral separation --- statistical tests N80-27332
Flight investigation of cockpit-displayed traffic information utilizing coded symbology in an advanced operational environment
[NASA-TP-1684] N80-27360

COLLISIONLESS PLASMAS
Experimental investigation of the anomalous skin effect and computer simulation of the collisionless interchange instability N80-28184
Equilibrium and stability in strongly inhomogeneous plasmas --- confinement schemes including field-reversed mirrors and tokamak sheaths N80-28188

COLLOCATION
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27859
Collocation methods for elliptic partial differential equations N80-28094

COLOR
Multicolor inversion diagnostic for tactical motor plumes
[AD-A083904] N80-27426

COLOR VISION
Human color discriminating function with muscular tension during exposure to vestibular stimuli N80-28004

COLORADO
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

COMBUSTION
AFOSR Contractors Meeting on Air-Breathing Combustion Dynamics and Kinetics, 1979 Abstracts
[AD-A083651] N80-27367
Development and verification of radiation models N80-27380
Shock tube studies of the N20/CH4/CO/Ar systems
[AD-A083722] N80-27455
The combustion of carbon, coal and coal related fuels in an opposed flow diffusion flame burner N80-27493

COMBUSTION CHAMBERS
Combustor Modelling --- conference
[AGARD-CP-275] N80-27371
Modeling the combustion chamber of a gas turbine: A mechanics viewpoint N80-27372
Fundamental modelling of mixing, evaporation and kinetics in gas turbine combustors N80-27373
Mathematical modelling of gas-turbine combustion chambers N80-27374
On the prediction of temperature profiles at the exit of annular combustors N80-27377
Coalescence/dispersion modelling of gas turbine combustors N80-27384
Numerical analysis and experimental data in a continuous flow combustion chamber: A comparison N80-27385
Modeling furnances fed with oxygen-enriched air N80-27389
A chemical reactor model and its application to a practical combustor N80-27392
Aerodynamic study of a combustion chamber with a view to its semi-empirical modelling N80-27395
Fuel property effects on combustor performance
[AD-A084017] N80-27511

COMBUSTION EFFICIENCY
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498
Combustion of coal-oil mixtures in a 700 HP watertube boiler N80-27504

COMBUSTION PHYSICS
Second-order closure modeling of turbulent mixing and reacting flows N80-27378
Combustor modelling for scramjet engines N80-27379
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
Combustion zone modeling in unsteady regime N80-27385
Numerical analysis and experimental data in a continuous flow combustion chamber: A comparison N80-27388
An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390
Mathematical modeling of boiler operations N80-27391
Combustion modelling within gas turbine engines, some applications and limitations N80-27394
Ignition, combustion, detonation, and quenching of reactive mixtures
[AD-A083737] N80-27456

COMBUSTION PRODUCTS
Performance, emissions, and physical characteristics of a rotating combustion aircraft engine, supplement A
[NASA-CR-135119] N80-27361
Fundamental characterization of alternative fuel effects in continuous combustion systems N80-27382

COMBUSTION STABILITY
Analysis of low-frequency disturbances in afterburners N80-27386
Rocket research at Georgia Tech.
[AD-A083764] N80-27425
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498

COMETS
Problems and strategy of the first flight to the comets
[NASA-TM-76241] N80-27402

COMMERCIAL AIRCRAFT
Noise Abatement Economic Policy Analysis Model NAEPAM. Volume 2: User's guide
[AD-A081159] N80-27838
Noise Abatement Economic Policy Analysis Model NAEPAM, volume 1
[AD-A081190] N80-27839

COMMERCIAL ENERGY
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Overview of R&D status on COM technology in Japan N80-27495

COMMUNICATION EQUIPMENT
Orbiter S-band direct link system verification test report
[NASA-TM-81110] N80-27414

COMMUNICATION NETWORKS
On the spatial capacity of packet radio networks N80-27549
Protocol constructions for communication networks N80-27550
Information processing techniques program. Volume 1. Packet speech systems technology
[AD-A083195] N80-27559
Modeling and analysis of switched interconnection networks N80-27594

COMMUNICATION SATELLITES
Space construction system analysis study: Project systems and missions descriptions
[NASA-CR-160748] N80-27400
High capacity low delay packet broadcasting multiaccess schemes for satellite repeater systems N80-27548
Feedback nulling demonstration system hardware
[AD-A084013] N80-27561
Sharing of the band 12.2-12.7 GHz between the broadcasting-satellite and fixed services
[PB80-157423] N80-27590

COMMUNICATION THEORY
Comments on the special issue of Communications in Statistics (Volume A8, No. 10) concerned with weather modification experiments
[AD-A083628] N80-27963

COMMUNICATIONS TECHNOLOGY SATELLITE
Digital transmission experiment over CTS (Communication Technology Satellite) audio channels
[PB80-159544] N80-27589

COMMUNITIES
Community noise exposure resulting from aircraft operations. Volume 7: Acoustic data on aircraft ground runup noise suppressors
[AD-A083701] N80-27837

COMPARATORS
Analytical plotters in Defense Mapping Agency
[AD-A083794] N80-27783

COMPOSITE MATERIALS
Moisture determination in composite materials using positron lifetime techniques
[NASA-TP-1681] N80-27428
Feasibility of Kevlar 49/PMR-15 polyimide for high temperature applications
[NASA-TM-81560] N80-27429
Investigation of application parameters and testing of rain erosion coatings
[AD-A083578] N80-27430
Elasticity theory of composites
[AD-A083173] N80-27431
Cylindrical shells of bimodulus composite material
[AD-A083974] N80-27432
Composite materials for structural design
[AD-A083721] N80-27433
Composite pyroeletric materials
[AD-A083726] N80-27434
Large deflection and large-amplitude free vibrations of laminated composite-material plates
[AD-A084070] N80-27436
Residual stress measurements on aluminum--graphite composite using X-ray diffraction techniques
[AD-A083795] N80-27437
Optical properties and solar selectivity of metal-insulator composite films N80-28177

COMPOSITE STRUCTURES
Composite materials for structural design
[AD-A083721] N80-27433
Vibration of composite structures
[AD-A084069] N80-27435

COMPRESSIBLE FLOW
A second order accurate numerical method for supersonic boundary layer flow past a compression corner
[AD-A084550] N80-27294
Analytical models for the compressive heating ignition of high explosives
[AD-A083889] N80-27460
Predictor-corrector methods for time dependent compressible flows N80-27619
Turbulent Boundary Layers: Experiments, Theory and Modeling --- conference
[AGARD-CP-271] N80-27647

COMPRESSION LOADS
Inelastic analysis and design of cold-formed steel beams with stiffened compression flanges N80-27715

COMPRESSION TESTS
Axial and radial compression of ion beams
[AD-A083702] N80-28171

COMPRESSIVE STRENGTH
Inelastic analysis and design of cold-formed steel beams with stiffened compression flanges N80-27715

COMPRESSOR ROTORS
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288

COMPRESSORS
Conceptual design study for Coherent Anti-Stokes Raman Spectroscopy (CARS) diagnostics in the AMMRC ballistic compressor facility
[AD-A083492] N80-27453

COMPTON EFFECT
Studies in the ionization of atoms and ions by photons N80-28162
Comptomization and radiation spectra of X-ray sources. Calculation of the Monte Carlo method
[NASA-TM-76181] N80-28193

COMPUTATION
Programming language facilities for numerical computation
[AD-A083815] N80-28069
Complexity and computability of solutions to linear programming systems
[AD-A084682] N80-28076

COMPUTATIONAL FLUID DYNAMICS
Analysis of computational methods for nonlinear parabolic differential systems
[AD-A084236] N80-28122

COMPUTER GRAPHICS
A 16 level color display system for two dimensional ultrasonic data
[AD-A083854] N80-27678
Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10219] N80-27770
Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10221] N80-27771
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
A study of the use of meteorological satellite, weather radar, and integrated graphics products in the flight service station system
[AD-A084012] N80-27961
A computer graphics system for macromolecular model building N80-28068
BMG reference manual
[AD-A084454] N80-28074
Interactive computer graphics. Citations from the NTIS data base
[PB80-807738] N80-28079
Interactive computer graphics. Citations from the Engineering Index data base
[PB80-807746] N80-28080
Region representation: Quadtree-to-raster conversion
[AD-A084288] N80-28112
Region representation: Quadtrees from binary arrays
[AD-A084287] N80-28117
Spatial data management system
[AD-A083948] N80-28236

COMPUTER INFORMATION SECURITY
Security in data base management systems N80-28232

COMPUTER NETWORKS

Formal techniques for fault-tolerance in Distributed Data Processing (DDP)
[AD-A084537] N80-28059

Computer networks: A martingale approach
N80-28083

Report of the Advisory Committee on Information Network Structure and Functions for the Executive Office of the President
[PB80-165673] N80-28241

COMPUTER PROGRAMMING

Air to air helicopter fire control equations and software generation
[AD-A084115] N80-27359

Computer science and technology: Validation verification, and testing for the individual programmer
[PB80-168960] N80-28061

Program checking N80-28066

CHEMEQ: A subroutine for solving stiff ordinary differential equations
[AD-A083545] N80-28097

COMPUTER PROGRAMS

CAS2D: FORTRAN program for nonrotating blade-to-blade, steady, potential transonic cascade flows
[NASA-TP-1705] N80-27284

Documentation of cascade unsteady pressure difference program
[AD-A083987] N80-27368

Combustor modelling for scramjet engines
N80-27379

A chemical reactor model and its application to a practical combustor N80-27392

Shuttle program. MCC Level C formulation requirements: Entry guidance and entry autopilot
[NASA-TM-81093] N80-27408

Shuttle program. MCC level C formulation requirements: Shuttle TAEM guidance and flight control
[NASA-TM-81094] N80-27409

The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419

A computer program for thermal radiation from gaseous rocket exhaust plumes (GASRAD)
[NASA-CR-161496] N80-27423

Program documentation for the gas chromatography automation system N80-27464

Computer prediction of large reflector antenna radiation properties
[NASA-CR-163253] N80-27556

Computer programs for electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness
[AD-A084352] N80-27570

Finite Element Analysis Program (FEAP) for conduction heat transfer
[AD-A084522] N80-27645

Optical performance analysis of CO2 laser fusion systems N80-27684

A unified numerical approach for thermally induced stress waves N80-27714

Instructions for the use of the CIVM-Jet 4C finite-strain computer code to calculate the transient structural responses of partial and/or complete arbitrarily-curved rings subjected to fragment impact
[NASA-CR-159873] N80-27720

As-built specification for the ERIM tape conversion to LARSYS 2 program (ECTL2)
[E80-10202] N80-27768

Final design specification for LARSYS/ISOCLS modification for LACIE phase 3
[E80-10212] N80-27769

Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10219] N80-27770

Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10221] N80-27771

PDP 11/45 LACIE phase 11/111 automatic status and tracking system functional design specification
[E80-10222] N80-27772

Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 1-12)
[E80-10226] N80-27775

Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 13-23)
[E80-10227] N80-27776

ASHMET: A computer code for estimating insolation incident on tilted surfaces
[NASA-TM-78286] N80-27807

Noise Abatement Economic Policy Analysis Model NAEPAM. Volume 2: User's guide
[AD-A081159] N80-27838

Noise Abatement Economic Policy Analysis Model NAEPAM, volume 1
[AD-A081190] N80-27839

FAA integrated noise model validation. Phase 1: Analysis of integrated noise model calculations for air carrier flyovers
[AD-A081426] N80-27842

Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27859

Computer science and technology: Validation verification, and testing for the individual programmer
[PB80-168960] N80-28061

A software design system N80-28065

The Electric Simulator Program (ESP) usage guide
[AD-A084676] N80-28075

Complexity and computability of solutions to linear programming systems
[AD-A084582] N80-28076

Performance ripple effect analysis for large-scale software maintenance
[AD-A084351] N80-28078

Interactive computer graphics. Citations from the NTIS data base
[PB80-807738] N80-28079

Interactive computer graphics. Citations from the Engineering Index data base
[PB80-807746] N80-28080

Using ANS FORTRAN
[PB80-168545] N80-28082

Using parallel processing for problem solving
[AD-A084638] N80-28093

Computer calculation of mechanisms involving intermittent motions
[AD-A083809] N80-28098

A simple derivation of Glassman's general N fast Fourier transform
[AD-A083811] N80-28104

True-integrating environmental noise monitor and sound-exposure level meter. Volume 3: Microprocessor program and data interface description
[AD-A083320] N80-28156

Measurement of strongly refracting, three-dimensional index distributions N80-28176

Data base management. Citations from the Engineering Index data base
[PB80-808173] N80-28229

COMPUTER SYSTEMS DESIGN

Analysis of expandability and modifiability of computer configuration concepts for ATC. Volume 1: Distributed concept
[AD-A084045] N80-27314

A microprocessor based high speed packet switch for satellite communications
[NASA-CR-163357] N80-27557

A microprocessor based high speed packet switch for satellite communications, executive summary
[NASA-CR-163357] N80-27558

A systematic approach for the design and analysis of distributed computer systems N80-28141

COMPUTER SYSTEMS PROGRAMS

Protocol constructions for communication networks N80-27550

COMPUTER TECHNIQUES

The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700

Analytical plotters in Defense Mapping Agency
[AD-A083794] N80-27783

Computer-oriented methods for assessing reliability of complex systems N80-27860

COMPUTERIZED DESIGN

Optimum inelastic design of seismic-resistant reinforced concrete frame structures
[PB80-164635] N80-27532

Printed circuits. Citations from the NTIS data base
[PB80-807563] N80-27615

Force balancing machines and optimization of dynamic relations for planar mechanisms
N80-27693

Performance prediction from a computer hardware description
[AD-A083842] N80-28058

COMPUTERIZED SIMULATION

The general aviation dynamics model. Volume 1: Executive summary
[AD-A073543] N80-27273

The general aviation dynamic model. Volume 2: Technical report
[AD-A073544] N80-27274

An alternative approach to the numerical simulation
[NASA-TM-81542] N80-27286

Quaternion utilization in a missile model
[AD-A084263] N80-27358

Air to air helicopter fire control equations and software generation
[AD-A084115] N80-27359

Chemical kinetic modelling for combustion application N80-27383

Space shuttle main engine plume radiation model
[NASA-CR-161498] N80-27415

Cost/benefit analysis of reentry vehicle hardness testing using the FAST methodology. Volume 2: Methods
[AD-A083336] N80-27420

Computer modeling of pulsed chemical lasers
[AD-A083648] N80-27686

Development and application of a computational shear band model
[AD-A084029] N80-27721

Computer simulation of a magnetospheric substorm N80-27862

The application of regression methods to the initial transient problem in computer simulations
N80-28067

Approximate solutions of queueing network models of computer systems N80-28086

Variance reduction techniques for the simulation of queueing networks N80-28088

Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175

Experimental investigation of the anomalous skin effect and computer simulation of the collisionless interchange instability N80-28184

COMPUTERS

Protocol constructions for communication networks N80-27550

Printed circuits. Citations from the Engineering Index data base
[PB80-807571] N80-27614

BMG reference manual
[AD-A084454] N80-28074

CONCAVITY

Longitudinal vortices in concave surface boundary layer N80-27656

CONCENTRIC CYLINDERS

Free vibrations of a concentric circular conical beam with a concentric circular cylindrical bore
[AD-A083292] N80-27724

CONCRETES

Hysteric behavior of reinforced concrete structural walls
[PB80-165905] N80-27533

Development of a rebar dowel anchorage system for attaching the California type 25 concrete barrier to existing bridges
[PB80-161722] N80-27534

Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543

Serviceability and reliability analysis of partially prestressed concrete beams N80-27716

Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels N80-27717

CONDENSATION

Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation N80-27442

CONDENSING

Heat and mass transfer from a rotating disk with phase change N80-27825

CONDUCTIVE HEAT TRANSFER
Numerical methods for inverse transient heat conduction problems N80-27624
Finite Element Analysis Program (FEAP) for conduction heat transfer
[AD-A084522] N80-27645
CONFERENCES
FAA/NASA Proceedings Workshop on Wake Vortex Alleviation and Avoidance
[NASA-CR-163317] N80-27285
Air Traffic Management: Civil/Military System and Technologies — conference
[AGARD-CP-273] N80-27324
AFOSR Contractors Meeting on Air-Breathing Combustion Dynamics and Kinetics, 1979 Abstracts
[AD-A083651] N80-27367
Combustor Modelling — conference
[AGARD-CP-275] N80-27371
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Colloquim on flow separation
[AD-A083741] N80-27636
Summary of the AFOSR/MSU Research Specialists Workshop on Coherent Structure in Turbulent Boundary Layers
[AD-A083717] N80-27637
Turbulent Boundary Layers: Experiments, Theory and Modeling — conference
[AGARD-CP-271] N80-27647
On Climatology, Hydrology, Atmospheric Research and Meteorology (CHARM) from Space — conference proceedings, Ajaccio, France, 12-16 Nov. 1979
[ESA-SP-150] N80-27733
Control of Particulate Emissions in the Primary Nonferrous Metals Industries — conference
[PB80-151822] N80-27847
High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements
[NASA-CP-2134] N80-27866
European earthquake prediction program — conference proceedings, Strasbourg, 31 Jan. - 1 Feb. 1980
[ESA-SP-156] N80-27874
Climate Models: Performance, intercomparison and sensitivity studies, volume 1 — conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-1] N80-27917
Climate models: Performance, intercomparison and sensitivity studies, Volume 2 — conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-2] N80-27936
Time-of-Day Corrections to Aircraft Noise Metrics
[NASA-CP-2135] N80-28150
Image Coding: Report of a Workshop
[PB80-164817] N80-28240
CONFIDENCE LIMITS
An investigation of a statistical procedure for monitoring two-sample life tests
[AD-A084041] N80-27710
CONGRESSIONAL REPORTS
Report of the Advisory Committee on Information Network Strucuture and Functions for the Executive Office of the President
[PB80-165673] N80-28241
Authorizing appropriations of the National Aeronautics and Space Administration
[HR-REPT-96-1142] N80-28242
NASA authorization, 1981, volume 4
[GPO-61-147] N80-28243
US energy assistance to developing countries: Clarification and coordination needed
[PB80-162720] N80-28244
CONICAL BODIES
Free vibrations of a concentric circular conical beam with a concentric circular cylindrical bore
[AD-A083292] N80-27724
CONNECTICUT
Solar heating system installed at Stamford, Connecticut
[NASA-CR-161436] N80-27800
CONSERVATION EQUATIONS
An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390
CONSTRUCTION INDUSTRY
Analysis of code related responses from the solar demonstration program
[PB80-153968] N80-27827
CONSULTING
User need in documentation and information. Citations from the NTIS data base
[PB80-807910] N80-28239
CONTACT LENSES
Transient diffusion in multi-layer biological tissue N80-27979
CONTINENTAL SHELVES
Propagation and generation of internal tides on the continental margin N80-27973
Bottom-water temperature trends in the Middle Atlantic Bight during spring and autumn, 1964-76
[PB80-166200] N80-27977
CONTINGENCY
Contingency tables
[AD-A084262] N80-28134
CONTINUOUS RADIATION
IUE observations of a luminous M supergiant that exhibits intense continuum in the far ultraviolet
[NASA-TM-80681] N80-28273
CONTINUUM FLOW
Numerical analysis and experimental data in a continuous flow combustion chamber: A comparison N80-27388
CONTINUUM MECHANICS
Energy transport in harmonic lattices N80-28219
CONTRACT NEGOTIATION
Statistical methods in sole source contract negotiation
[AD-A083983] N80-28227
CONTROL THEORY
Control of nonlinear systems
[AD-A083963] N80-28089
Optimal stationary linear control of the Wiener process
[AD-A084350] N80-28135
CONVECTION
The solution of boundary value problems in diffusive heat and mass transfer with convection: Functional analytic methods N80-27627
A power model for plasma convection — f region scenarios
[AD-A084653] N80-28203
CONVECTION CLOUDS
Desert convection clouds
[AD-A083965] N80-27962
CONVECTIVE HEAT TRANSFER
SSV Generic OFT first stage ascent base convective heating environments
[NASA-CR-161499] N80-27630
Addendum to SSV generic OFT first stage ascent base convective heating environments
[NASA-CR-161497] N80-27631
Magma migration — applied to thermal evolution N80-27855
CONVERGENCE
Research on numerical algorithms for the three dimensional Navier-Stokes equations. 1: Accuracy, convergence and efficiency
[AD-A083664] N80-27833
CHEMEQ: A subroutine for solving stiff ordinary differential equations
[AD-A083545] N80-28097
Rates of convergence for estimation and testing in multinomial distributions N80-28125
COPPER ALLOYS
The effect of ion plating and ion implantation on the cyclic response and fatigue crack initiation of metals and alloys
[AD-A083643] N80-27478
CORN
Analysis of scanner data for crop inventories — Brazil and Argentina
[E80-10191] N80-27767
CORONARY ARTERY DISEASE
Experimental coronary sclerosis induced by immobilization of rabbits: A new model of arteriosclerosis
[NASA-TM-76196] N80-27990
Morphofunctional correlations in the experimental study of myocardiopathies under the stress of forced restraint. Note 2: The influence of adrenal imbalance
[NASA-TM-76138] N80-28040
Mechanism of selective lesion of the cardiovascular system in psycho-emotional stress
[NASA-TM-76035] N80-28045
CORRELATION
Semi-empirical correlations for gas turbine emissions, ignition, and flame stabilization N80-27393
Use of petroleum-based correlations and estimation methods for synthetic fuels
[NASA-TM-81533] N80-27509
Structural parameter identification of member characteristics in a finite element model N80-28095
Modern empirical statistical spectral analysis
[AD-A084142] N80-28120
CORRELATION COEFFICIENTS
An anomaly in the Pearson product-moment correlation coefficient
[AD-A084354] N80-28136
COSMIC RAYS
Cosmic Rays. Citations from the NTIS data base
[PB80-807647] N80-28291
COSMONAUTS
Method for assessing hemodynamics and detecting latent insufficiency of cerebral circulation in cosmonaut candidates N80-28012
COST ANALYSIS
Study of cost/benefit tradeoffs available in helicopter noise technology applications
[AD-A083955] N80-27354
CF6-6D engine performance deterioration
[NASA-CR-159786] N80-27364
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498
Impact of propulsion system R and D on electric vehicle performance and cost
[NASA-TM-81548] N80-27805
Comparative study of energy accounting for heavy ion fusion with various driver accelerators
[IPPJ-454] N80-28195
COST REDUCTION
General aviation dynamics: The impact of cost recovery N80-27300
COSTS
Costs and benefits of requiring new production of older aircraft types to meet amended noise standards
[AD-A080130] N80-27356
COUPLING
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs — antenna design N80-27597
CRACK PROPAGATION
The F-4 service life tracking program crack growth gages
[AD-A083978] N80-27353
Stress crack phenomena. Citations from the NTIS data base
[PB80-807886] N80-27730
Stress crack phenomena. Citations from the NTIS data base
[PB80-807879] N80-27731
CRACKS
Defect characterization and dimensioning of cracks in welds by the ultrasonic diffraction method
[PB80-161755] N80-27713
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083671] N80-27723
CRASH INJURIES
National crash severity study statistics
[PB80-16040] N80-28258
CRASHES
National crash severity study statistics
[PB80-16040] N80-28258
CREEP RUPTURE STRENGTH
Investigation into adaptive control of a slip-cast, reaction-bonded silicon-nitride process via adaptive learning network modeling
[AD-A083730] N80-28091
CRITICAL POINT
The critical points of alloys of iron and cobalt during rapid heating
[NASA-TM-75825] N80-27473
CROP INVENTORIES
On the accuracy of pixel relaxation labeling
[E80-10185] N80-27765
Analysis of scanner data for crop inventories — Brazil and Argentina
[E80-10191] N80-27767
Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10219] N80-27770

Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10221] N80-27771

CROSSED FIELDS
Crossed molecular beam study of the reactions of oxygen and fluorine atoms
[AD-A084255] N80-28174

CRUCIFORM WINGS
Effect of Reynolds number on stability characteristics of a cruciform wind-body
[NASA-TP-1683] N80-27293

CRUDE OIL
Startup and initial feasibility testing on the Salem Harbor COM demonstration N80-27499
Investigations of coal-oil mixtures as a utility boiler light-off fuel N80-27501
Coal: An alternate fuel for thermal enhanced oil recovery steam generation
[SAN-2418-1] N80-27524

CRUISE MISSILES
Quaternion utilization in a missile model
[AD-A084263] N80-27356
Carbon slurry fuels for volume limited missiles
[AD-A084710] N80-27512

CRYOGENIC EQUIPMENT
Gas replenishment techniques for use in high-altitude, long-duration scientific balloon flights
[AD-A084486] N80-27297

CRYSTAL GROWTH
Processing of materials in space — using the molecular shield and space shuttle
[ISRO-SN-04-78] N80-27401

CRYSTAL LATTICES
Raman scattering studies of solid-phase species — diagnosing spacecraft contaminants
[AD-A083926] N80-27459
Dynamical symmetry breaking in lattice gauge theories N80-28210

CRYSTALLIZATION
A Monte Carlo study of crystallization and crystalline order in simple two-dimensional systems
N80-28209

CRYSTALS
Dynamical symmetry breaking in lattice gauge theories N80-28210

CURIE TEMPERATURE
The critical points of alloys of iron and cobalt during rapid heating
[NASA-TM-75825] N80-27473

CURRENT CONVERTERS (AC TO DC)
Transient stability analysis of ac-dc power systems
N80-27595

CURRENT REGULATORS
Analysis and modelling of a current-fed force-commutated power converter N80-27589

CURVE FITTING
ONESAM, a computer program for nonparametric data analysis and density quantile estimation
[AD-A084259] N80-28077
Equilibria of the curvature functional and manifolds of nonlinear interpolating spline curves
[AD-A083607] N80-28106

CYCLIC LOADS
Bending stress and frequency calculations for the bearing-pack shaft — drills
[SAND-80-7030] N80-27729

CYLINDRICAL BODIES
Cylindrical shells of bimodulus composite material
[AD-A083974] N80-27432

CYLINDRICAL SHELLS
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
Dynamic instability of an elastic cylindrical shell excited by a transient acoustic wave — underwater structures
[AD-A083338] N80-27727

D

D REGION
Development of a small rocket system for conductivity measurements in the high latitude disturbed D-region in support of ELF/VLF propagation studies
[AD-A083331] N80-27997

DAMPING
Tire stiffness and damping determined from static and free-vibration tests — aircraft tires
[NASA-TP-1671] N80-27302

DATA
Experiments in the determination of seismic wave absorption N80-27994

DATA BASES
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
The European-Mediterranean Seismological Centre (EMSC) N80-27991
Interactive nonlinear structural analysis. A review of the GIFTS-STAGS union
[AD-A084209] N80-28073
The optimization of query processing on distributed database systems N80-28087
Satellite and missile data generation for AIS
[AD-A084326] N80-28143
Data base management. Citations from the NTIS data base
[PB80-808165] N80-28228
Data base management. Citations from the Engineering Index data base
[PB80-808173] N80-28229
Data base management. Citations from the NTIS data base
[PB80-808157] N80-28230
Applying behavioral abstraction to information system design and integrity N80-28231
Security in data base management systems
N80-28232
Evaluation and enhancement of the performance of relational database management systems
N80-28233
Access path optimization in multidimensionally accessed database files N80-28234
Mechanical properties data center
[AD-A083123] N80-28237

DATA COLLECTION PLATFORMS
Applications of satellite data relay to problems of field seismology
[NASA-TM-80673] N80-27871
A first European joint effort in earthquake prediction research N80-27984
Earthquake prediction research for the northern Anatolian fault zone (Turkey) N80-27985
The Meteosat data collection system and its potential as a data relay for geophysical measurements
N80-27990

DATA CONVERSION ROUTINES
Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 1-12)
[E80-10228] N80-27775
Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 13-23)
[E80-10227] N80-27776

DATA LINKS
Potential use of high frequency data transmission for oceanic air traffic control improvement
[AD-A075810] N80-27313
Enhanced Terminal Information Services (ETIS) utilizing the Discrete Address Beacon System (DABS) data link-concept description
[AD-A073205] N80-27319
Data link: The key to improvements in civil/military air traffic management? N80-27330
Interactive nonlinear structural analysis. A review of the GIFTS-STAGS union
[AD-A084209] N80-28073

DATA MANAGEMENT
Geomagnetic observations 1978 — station locations, instruments, and data management
[PB80-148087] N80-27907
Spatial data management system
[AD-A083729] N80-28057

Security in data base management systems
N80-28232
Evaluation and enhancement of the performance of relational database management systems
N80-28233
A systematic approach to the management of data on distributed data bases N80-28235
Spatial data management system
[AD-A083948] N80-28236

DATA PROCESSING
Applications of microprocessors in air traffic
N80-27341
As-built specification for the ERIM tape conversion to LARSYS 2 program (ECTLZ)
[E80-10202] N80-27788
Final design specification for LARSYS/ISOCLS modification for LACIE phase 3
[E80-10212] N80-27789
Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10219] N80-27770
Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10221] N80-27771
PDP 11/45 LACIE phase 11/111 automatic status and tracking system functional design specification
[E80-10222] N80-27772
Interactive nonlinear structural analysis. A review of the GIFTS-STAGS union
[AD-A084209] N80-28073

DATA PROCESSING EQUIPMENT
Approach to sounding on the VAS processor
[NASA-TM-80713] N80-28056

DATA RECORDING
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700

DATA REDUCTION
Meteorological research — optimization of processing techniques applied to satellite sounding data N80-27739
A note on the generation of Poisson-distributed random numbers with large mean
[E80-10234] N80-27773
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy — Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
Approach to sounding on the VAS processor
[NASA-TM-80713] N80-28056
ONESAM, a computer program for nonparametric data analysis and density quantile estimation
[AD-A084259] N80-28077
Fitting mosaic models to textures
[AD-A084291] N80-28115

DATA RETRIEVAL
User need in documentation and information. Citations from the NTIS data base
[PB80-807910] N80-28239

DATA SAMPLING
Sampling problems and radiation budgets: Data requirements N80-27740

DATA SMOOTHING
Data resolution versus forestry classification — Sam Houston National Forest, Texas
[E80-10189] N80-27790
Moving weighted average smoothing extended to the extremities of the data, revision
[AD-A083608] N80-28111

DATA STORAGE
Spatial data management system
[AD-A083729] N80-28057
Access path optimization in multidimensionally accessed database files N80-28234

DATA SYSTEMS
Screwworm Eradication Data System, phase 2 project plan: Field tests — Mexico
[E80-10225] N80-27774
Spatial data management system
[AD-A083729] N80-28057
Formal techniques for fault-tolerance in Distributed Data Processing (DDP)
[AD-A084537] N80-28059
Evaluation and enhancement of the performance of relational database management systems
N80-28233

DATA TRANSMISSION
Digital transmission experiment over CTS (Communication Technology Satellite) audio channels
[PB80-158544] N80-27589
Feasibility study for the telemetransmission of data from geophysical network installed in a seismic area to an operational center N80-27878
DECISION MAKING
Solution approaches for network flow problems with multiple criteria
[AD-A084283] N80-28146
DECISION THEORY
Representation of physics knowledge by experts and novices
[AD-A084452] N80-28148
DECODING
A study of real time signal processing methods for decoding spread spectrum systems
[AD A084349] N80-27589
DECONDITIONING
Dynamics of human external respiration and blood gases under the combined effect of hypercapnia and hypoxia N80-28024
DEFLAGRATION
Ignition, combustion, detonation, and quenching of reactive mixtures
[AD-A083737] N80-27456
Evolution of deflagration in a cold combustible subjected to a uniform energy flux
[AD-A083822] N80-27461
DEFLECTION
Road rater and Benkelman beam pavement deflections
[PB80-158439] N80-27530
Flexible pavement deflection equation using elastic moduli and field measurements
[PB80-158247] N80-27542
DEFORESTATION
Climate experiments: Albedo experiments with a zonal atmospheric model N80-27955
DEHYDRATED FOOD
The question of using dehydrated foods during long-term space flights N80-28031
DELTA FUNCTION
Second-order closure modeling of turbulent mixing and reacting flows N80-27378
DELTA MODULATION
Voice transmission at 6000 bits per second using delta modulation
[AD-A084375] N80-27577
DENMARK
Inventory of snow cover and sea ice data — Northern and Southern Hemispheres
[PB80-164007] N80-27794
DENSITY DISTRIBUTION
A power model for plasma convection — f region scenarios
[AD-A084653] N80-28203
DEPTH
Correlations of seismic velocity with depth in southern California
[PB80-164060] N80-27906
DESCENT TRAJECTORIES
STS-1 operational flight profile. Volume 5: Descent, cycle 3. Appendix C: Monte Carlo dispersion analysis
[NASA-TM-81087] N80-27412
DESERTS
Climate experiments: Albedo experiments with a zonal atmospheric model N80-27955
Desert convection clouds
[AD-A083965] N80-27962
DESIGN ANALYSIS
Composite wall concept for high temperature turbine shrouds: Heat transfer analysis
[NASA-TM-81539] N80-27362
Optimum inelastic design of seismic-resistant reinforced concrete frame structures
[PB80-164635] N80-27532
A systematic approach for the design and analysis of distributed computer systems N80-28141
DETONATION
Ignition, combustion, detonation, and quenching of reactive mixtures
[AD-A083737] N80-27456
DETONATION WAVES
Evolution of deflagration in a cold combustible subjected to a uniform energy flux
[AD-A083822] N80-27461
DEVELOPING NATIONS
US energy assistance to developing countries: Clarification and coordination needed
[PB80-152720] N80-28244
DIAMAGNETISM
Measurements of the temperature dependent diamagnetism of liquids N80-28147
DIELECTRICS
Effect of various dielectrics on the design of millimeter-wave line scanning antennas
[AD-A083791] N80-27566
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs — antenna design N80-27597
Development of flammability criteria for transformer dielectric fluids
[PB80-163777] N80-27612
Determination of the optical constants of highly absorbing materials in the infrared region
[AD-A083883] N80-28181
DIESEL ENGINES
DRAFT recommended practice for measurement of gaseous and particulate emissions from heavy-duty diesel engines under transient conditions
[PB80-153943] N80-27844
DIETS
The question of using dehydrated foods during long-term space flights N80-28031
DIFFERENCE EQUATIONS
High order difference methods for quasilinear elliptic boundary value problems on general regions
[AD-A083824] N80-28102
DIFFERENTIAL EQUATIONS
Combustion zone modeling in unsteady regime N80-27385
The Electric Simulator Program (ESP) usage guide
[AD-A084676] N80-28075
Contingent derivatives of set-valued maps and solutions to nonlinear inclusions and differential inclusions
[AD-A083826] N80-28108
Optimal stationary linear control of the Wiener process
[AD-A084350] N80-28135
DIFFUSION
Theoretical study of a reaction-diffusion model for flame propagation in a gas N80-27440
The effects of surface phenomena on the spreading of oil on water
[PB80-163629] N80-27850
DIFFUSION FLAMES
A prediction model for turbulent diffusion flames including NO-formation N80-27375
The combustion of carbon, coal and coal related fuels in an opposed flow diffusion flame burner N80-27493
DIFFUSION WELDING
Ultrasonically activated diffusion bonding for fluidic control assembly
[AD-A084658] N80-27702
DIGITAL DATA
Digital transmission experiment over CTS (Communication Technology Satellite) audio channels
[PB80-158544] N80-27589
DIGITAL FILTERS
A study of the Sequential Regression (SER) algorithm and its applications N80-28063
DIGITAL SIMULATION
Digital image analysis of two phase flow data
[AD-A084187] N80-27646
DIGITAL SYSTEMS
Probability transforms of digital pictures
[AD-A084286] N80-28071
A path-length distance transform for quadtrees
[AD-A084293] N80-28072
DIGITAL TECHNIQUES
The evaluation of a methodology to measure manual digitizing error in cartographic data bases N80-27761
Formal techniques for fault-tolerance in Distributed Data Processing (DDP)
[AD-A084537] N80-28059
DIMENSIONAL ANALYSIS
Defect characterization and dimensioning of cracks in welds by the ultrasonic diffraction method
[PB80-161755] N80-27713
DIPOLE MOMENTS
Tables of transition probabilities and branching ratios for electric dipole transmissions between arbitrary levels of hydrogen-like atoms
[NASA-TM-80682] N80-28167
DIRAC EQUATION
A fiber bundle approach to unified field theory N80-28224
A mathematical study of the non-relativistic limit in quantum mechanics N80-28226
DIRECT CURRENT
Transient stability analysis of ac-dc power systems N80-27595
DIRECTIONAL ANTENNAS
Effect of various dielectrics on the design of millimeter-wave line scanning antennas
[AD-A083791] N80-27566
DISASTERS
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
DISCRETE ADDRESS BEACON SYSTEM
Enhanced Terminal Information Services (ETIS) utilizing the Discrete Address Beacon System (DABS) data link-concept description
[AD-A073205] N80-27319
Discrete address beacon system. Citations from the NTIS data base
[PB80-807522] N80-27322
Discrete address beacon system — air traffic control N80-27344
Surveillance performance measurements of the SSR mode of the discrete address beacon system N80-27346
DISCRETE FUNCTIONS
Contingency tables
[AD-A084262] N80-28134
DISLOCATIONS (MATERIALS)
A study of abrasive wear N80-27692
DISPERSING
Coalescence/dispersion modelling of gas turbine combustors N80-27384
DISPERSIONS
Stable coal/fuel oil dispersions N80-27503
DISPLAY DEVICES
Flight investigation of cockpit-displayed traffic information utilizing coded symbology in an advanced operational environment
[NASA-TP-1684] N80-27360
System description and analysis. Part 1: Feasibility study for helicopter/VTOL wide-angle simulation image generation display system
[NASA-CR-152376] N80-27397
A 16 level color display system for two dimensional ultrasonic data
[AD-A083854] N80-27678
Probability transforms of digital pictures
[AD-A084286] N80-28071
DISSOCIATION
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation N80-27442
DISTANCE
A path-length distance transform for quadtrees
[AD-A084293] N80-28072
DISTRIBUTION FUNCTIONS
Sampling representations and approximations for certain functions and stochastic processes N80-28128
Measurement of strongly refracting, three-dimensional index distributions N80-28176
DIVING (UNDERWATER)
Respiration and gas exchange under hyperbaric conditions N80-28016
DOPPLER EFFECT
Global wind determination by interferometric techniques in the troposphere stratosphere and mesosphere N80-27759
DOPPLER RADAR
The development and test of a tactical self-contained landing system — landing military helicopters when the safe corridor is unknown N80-27334
DRAINAGE
Dewatering systems for surface coal mines
[PB80-160153] N80-27789
Application of geomorphic principles to environmental management in semiarid regions
[PB80-169303] N80-27908

DRAINAGE PATTERNS
Performance of open-graded friction courses
[PB80-162985] N80-27531
DRILLS
Bending stress and frequency calculations for the bearing-pack shaft --- drills
[SAND-80-7030] N80-27729
DROPS (LIQUIDS)
A numerical investigation of the efficiency with which aerosol particles collide with cloud and small rain drops N80-27831
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964
DRUGS
Effect of psychotropic drugs on gastric ulcers induced by immobilization: Increased protective effect of amitriptyline caused by chlordiazepoxide
[NASA-TM-76197] N80-27991
DRY FRICTION
A study of abrasive wear N80-27692
DUAL SPIN SPACECRAFT
An attitude acquisition technique for dual-spin spacecraft --- spacecraft rotor alignment
N80-27417
DUCTILITY
Inelastic seismic response of a torsionally unbalanced single-story building model
[PB80-164197] N80-27538
DYNAMIC CHARACTERISTICS
Computer calculation of mechanisms involving intermittent motions
[AD-A083809] N80-28098
Studies in intramolecular motion N80-28161
DYNAMIC CONTROL
The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419
DYNAMIC MODELS
General aviation dynamics: The impact of cost recovery N80-27300
A dynamic model of the air transport industry
N80-27301
Climate and climate modeling N80-27734
Investigation of precursors around the Azores archipelago and the seismogenetic capacity of that area: Models of the earthquake process along the boundary between the African and Eurasian plates, affecting the Portuguese territory N80-27877
Climate simulations with spectral models of the atmosphere: Effect of spectral truncation
N80-27921
Simple seasonal climate models --- seasonal temperature field N80-27941
Verification of parameterizations in climate modeling N80-27942
Recent work on heat-balance models N80-27943
Equilibrium climatic zonation deduced from a statistical-dynamical model N80-27945
Performance of the Lawrence Livermore Laboratory zonal atmospheric model --- a general circulation model N80-27947
A severely truncated spectral model N80-27948
Some comments on the design of model response experiments for multi-time-scale systems
N80-27959
DYNAMIC RESPONSE
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543
DYNAMIC STABILITY
The theory and effects of neglecting stator and network transients N80-27592
Dynamic instability of an elastic cylindrical shell excited by a transient acoustic wave --- underwater structures
[AD-A083338] N80-27727
DYNAMIC STRUCTURAL ANALYSIS
Inelastic seismic response of a torsionally unbalanced single-story building model
[PB80-164197] N80-27538
DYNAMIC TESTS
Tire stiffness and damping determined from static and free-vibration tests --- aircraft tires
[NASA-TP-1671] N80-27302

E

E REGION
Numerical simulation and theory of strong ionospheric gradient-drift turbulence N80-27864
A discussion of artic ionograms
[AD-A083550] N80-27898
EARTH ALBEDO
Response of the NCAR general circulation model to changed land surface albedo N80-27936
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models --- latitudinal variation N80-27956
EARTH ATMOSPHERE
On Climatology, Hydrology, Atmospheric Research and Meteorology (CHARM) from Space --- conference proceedings, Ajaccio, France, 12-16 Nov. 1979
[ESA-SP-150] N80-27733
EARTH CORE
Magsat scientific investigations
[NASA-TM-80698] N80-27778
EARTH CRUST
Crustal stress and heat flow measurement in northern Anatolia N80-27883
EARTH HYDROSPHERE
The Earth's hydrosphere and cryosphere --- role of ocean circulation in models of climatic changes with emphasis on ocean surface temperature
N80-27736
Models of the ocean circulation and the global heat balance N80-27920
EARTH MOVEMENTS
Finite element modelling of torsional eigenvibrations of the Earth N80-27854
EARTH OBSERVATIONS (FROM SPACE)
The High Visible Resolution (HVR) instrument of the spot ground observation satellite
[NASA-TM-75830] N80-27781
EARTH RESOURCES
Energy programs at the Johns Hopkins University Applied Physics Laboratory
[PB80-163686] N80-27825
EARTH SURFACE
A microwave pressure sounder for the remote measurement of atmospheric surface pressure
N80-27758
Zonal and seasonal radiative effects of a doubling of atmospheric carbon dioxide concentration --- heating of the surface and troposphere N80-27952
EARTHQUAKE RESISTANCE
Hysteric behavior of reinforced concrete structural walls
[PB80-165905] N80-27533
Inelastic seismic response of a torsionally unbalanced single-story building model
[PB80-164197] N80-27538
EARTHQUAKE RESISTANT STRUCTURES
Optimum inelastic design of seismic-resistant reinforced concrete frame structures
[PB80-164635] N80-27532
EARTHQUAKES
European earthquake prediction program --- conference proceedings, Strasbourg, 31 Jan. - 1 Feb. 1980
[ESA-SP-156] N80-27874
A brief summary of a proposed program for earthquake prediction and the study of plate dynamics in southwest Europe N80-27875
Proposed program for earthquake prediction in southern Spain --- and study of the influence of large plate motions N80-27876
Investigation of precursors around the Azores archipelago and the seismogenetic capacity of that area: Models of the earthquake process along the boundary between the African and Eurasian plates, affecting the Portuguese territory N80-27877
The feasibility study for absolute measurement monitoring of gravity field variations, connected with internal mass variation N80-27879
Proposal for an earthquake prediction project in northern Greece N80-27881
In situ measurements of constraints to be made in Greece N80-27882
A first European joint effort in earthquake prediction research N80-27884
Earthquake prediction research for the northern Anatolian fault zone (Turkey) N80-27885
An outline proposal of some aims, strategies and objectives --- in earthquake prediction N80-27886
Research on specific models for the occurrence of significant earthquakes in Europe N80-27888
Future aspects of earthquake prediction research
N80-27889
ECOLOGY
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
The growth of birdwings
[NASA-TM-75821] N80-27986
ECONOMIC ANALYSIS
FAA aviation forecastings, fiscal years 1980 - 1991
[AD-A075382] N80-27275
Noise Abatement Economic Policy Analysis Model NAEPAM. Volume 2: User's guide
[AD-A081159] N80-27838
Noise Abatement Economic Policy Analysis Model NAEPAM, volume 1
[AD-A081190] N80-27839
ECONOMIC IMPACT
General aviation dynamics: The impact of cost recovery N80-27300
A dynamic model of the air transport industry
N80-27301
EDDY CURRENTS
Interdisciplinary study on advanced NDI techniques
[AD-A084242] N80-27712
Turbulent diffusion from a point source in stratified and neutral flows around a three dimensional hill. Part 1: Diffusion equation analysis
[PB80-163058] N80-27957
EDDY VISCOSITY
Large eddy simulation of turbulent channel flow: ILLIAC 5 calculation N80-27661
On the simulation of the oceanic general circulation N80-27939
EFFLUENTS
Future US phosphorus loadings to the Great Lakes: An integration of water quality management planning information
[PB80-160336] N80-27791
Coordinated aircraft and ship surveys for determining impact of river inputs on great lakes waters. Remote sensing results
[NASA-TP-1694] N80-27832
EIGENVECTORS
Finite element modelling of torsional eigenvibrations of the Earth N80-27854
EJECTORS
Computation of the turbulent mixing in curved ejectors --- V/STOL aircraft
[AD-A083905] N80-27634
ELASTIC PROPERTIES
Effect of some structural parameters on elastic rotor loads by an iterative harmonic balance N80-27348
Inelastic analysis and design of cold-formed steel beams with stiffened compression flanges
N80-27715
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083871] N80-27723
A boundary layer theory for the anisotropic plate
[AD-A083265] N80-27726
ELASTIC SHELLS
Dynamic instability of an elastic cylindrical shell excited by a transient acoustic wave --- underwater structures
[AD-A083338] N80-27727
ELASTIC WAVES
Elasticity theory of composites
[AD-A083173] N80-27431
ELASTOHYDRODYNAMICS
Fully flooded elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81543] N80-27696
Starved elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81549] N80-27699
ELASTOMERS
Tear strength and tensile strength of model filled elastomers
[AD-A083168] N80-27485
Preformed elastomeric joint sealers for bridges. Phase 2: Executive summary report
[PB80-162845] N80-27540
ELASTOPLASTICITY
Comparison of elastic and elastic-plastic structural analyses for cooled turbine blade airfoils
[NASA-TP-1679] N80-27719

ELECTRIC AUTOMOBILES
Impact of propulsion system R and D on electric vehicle performance and cost
[NASA-TM-81548] N80-27805
Small passenger car transmission test-Chevrolet 200 transmission
[NASA-CR-159835] N80-28255
ELECTRIC BRIDGES
Properties of superconductor-normal metal-superconductor microbridges N80-28215
ELECTRIC CHARGE
Composite pyroeletric materials
[AD-A083726] N80-27434
ELECTRIC CONTACTS
Non-linear junction characterization
[AD-A083898] N80-27602
ELECTRIC CURRENT
Current conduction mechanism and design optimization study of MIS solar cells N80-27796
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27798
ELECTRIC DIPOLES
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs --- antenna design N80-27597
ELECTRIC DISCHARGES
A field investigation of electric currents associated with severe local storms
[PB80-165632] N80-27971
ELECTRIC ENERGY STORAGE
Analysis and modelling of a current-fed force-commutated power converter N80-27599
ELECTRIC FIELDS
Preliminary investigations of the electrical response of water surfaces during marine thunderstorms N80-27911
ELECTRIC GENERATORS
Analysis and modelling of a current-fed force-commutated power converter N80-27599
Analysis of a two-fluid EHD power generator including effects of compressibility
[AD-A084125] N80-27610
Engineering test facility design definition
[NASA-TM-81499] N80-27799
ELECTRIC HYBRID VEHICLES
Phase 1 of the near term hybrid passenger vehicle development program
[NASA-CR-163219] N80-28245
Phase 1 of the near term hybrid passenger vehicles development program. Appendix A: Mission analysis and performance specification studies, volume 1
[NASA-CR-163220] N80-28246
Phase 1 of the near term hybrid passenger vehicle development program, appendix A. Mission analysis and performance specification studies. Volume 2: Appendices
[NASA-CR-163221] N80-28247
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies, volume 1
[NASA-CR-163222] N80-28248
Phase 1 of the near team hybrid passenger vehicle development program. Appendix C: Preliminary design data package, volume 1
[NASA-CR-163223] N80-28249
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies. Volume 2: Appendices
[NASA-CR-163224] N80-28250
Phase 1 of the near team hybrid passenger vehicle development program. Appendic C: Preliminary design data package. Volume 2: Appendices
[NASA-CR-163225] N80-28251
Phase 1 of the near term hybrid passenger vehicle development program. Appendix D: Sensitivity analysis
[NASA-CR-163226] N80-28252
ELECTRIC MOMENTS
Tables of transition probabilities and branching ratios for electric dipole transmissions between arbitrary levels of hydrogen-like atoms
[NASA-TM-80682] N80-28167
ELECTRIC MOTOR VEHICLES
Impact of propulsion system R and D on electric vehicle performance and cost
[NASA-TM-81548] N80-27805
Preliminary results of steady state characterization of near term electric vehicle breadboard propulsion system
[NASA-TM-81546] N80-28254
ELECTRIC MOTORS
Theory and design of electrical rotating machinery
[AD-A083499] N80-27604
Preliminary results of steady state characterization of near term electric vehicle breadboard propulsion system
[NASA-TM-81546] N80-28254
ELECTRIC POWER TRANSMISSION
Model for the ready definition and approximate comparison of alternative high voltage transmission systems
[DOE/ET-5916-1] N80-27611
ELECTRICAL GROUNDING
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs --- antenna design N80-27597
ELECTRICAL INSULATION
Development of flammability criteria for transformer dielectric fluids
[PB80-163777] N80-27612
Surveys of high-pressure effects in solids
[AD-A083728] N80-27722
ELECTRICAL PROPERTIES
Particle size effects on electrical properties of thick film resistors N80-27596
ELECTRICAL RESISTIVITY
Development of a small rocket system for conductivity measurements in the high latitude disturbed D-region in support of ELF/VLF propagation studies
[AD-A083331] N80-27897
Steady state magnetic diffusion from resistive interchange modes
[AD-A083915] N80-28199
High resistivity molecular beam epitaxial AlGaAs for device applications
[AD-A083778] N80-28221
ELECTROCHEMISTRY
Investigation of cadmium selenide photoelectrochemical cells
[AD-A083690] N80-27815
ELECTROHYDRODYNAMICS
Analysis of a two-fluid EHD power generator including effects of compressibility
[AD-A084125] N80-27610
ELECTROLYSIS
Hydrogen production using solid-polymer-electrolyte technology for water electrolysis and hybrid sulfur cycle
[EPRI-EM-1185] N80-27518
ELECTROLYTE METABOLISM
Effect of weightlessness and artificial gravity on ion-regulating function of rat kidneys N80-27999
Morphometric analysis of glomerules and juxtaglomerula system of the rat kidney in the course of experimental hypokinesia N80-28028
ELECTROMAGNETIC FIELDS
Exterior-interior aperture coupling of a rectangular cavity with wire obstacle
[AD-A084258] N80-27586
ELECTROMAGNETIC INTERACTIONS
Interactions in solids N80-28218
ELECTROMAGNETIC INTERFERENCE
HF direction finding by waterfront testing
[AD-A084549] N80-27584
ELECTROMAGNETIC RADIATION
Loran-C signal analysis
[AD-A084239] N80-27321
Infrared study of hydrogen chemisorbed on W(100) by surface electrommagnetic wave spectroscopy N80-27554
Statistical behavior of signals from the wideband signal
[AD-A084646] N80-27572
Loran-C signal analysis propagation model evaluation
[AD-A084338] N80-27583
An analytical study of wave propagation through foliage
[AD-A084348] N80-27587
ELECTROMAGNETIC SCATTERING
Electromagnetic scattering patterns from sinusoidal surfaces: Vertical polarization
[AD-A083919] N80-27580
Backscattering of electromagnetic waves from a layer of vegetation
[AD-A083922] N80-27585
Gradient scattering theory demonstrates that VHF, spread-F radar backscatter reveals streaming instabilities
[AD-A084844] N80-27571
Statistical behavior of signals from the wideband signal
[AD-A084646] N80-27572
Electromagnetic scattering by surfaces of arbitrary shape
[AD-A084347] N80-27580
ELECTROMAGNETIC WAVE TRANSMISSION
Backscattering of electromagnetic waves from a layer of vegetation
[AD-A083922] N80-27585
Computer programs for electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness
[AD-A084352] N80-27570
Wave propagation in particulate media
[AD-A083742] N80-28179
ELECTROMECHANICAL DEVICES
Distributed sensor systems and electromechanical analog facility
[AD-A084656] N80-28060
ELECTRON DENSITY PROFILES
A method for direct determination of real height from virtual height data for the auroral region of the ionosphere
[AD-A083139] N80-27899
ELECTRON ENERGY
Free electron lasers with variable parameter wigglers
[AD-A084323] N80-27669
Photochemical consequences of interchromophoric interactions
[AD-A084712] N80-28173
ELECTRON GUNS
Contiguous gridded gun development program
[AD-A084048] N80-27608
ELECTRON PLASMA
A study of the general plasma characteristics of a high power, multifilament ion source N80-28187
ELECTRON SCATTERING
Electron energy dissipation in layered media N80-27600
Low energy X-ray and electron interactions within matter
[AD-A083962] N80-28168
Reflection of oblique electron thermal modes in an inhomogenous plasma
[IPPJ-457] N80-28192
ELECTRON SPECTROSCOPY
Electron spectroscopic studies of surfaces and intersurfaces for adhesive bonding
[AD-A084254] N80-27492
ELECTRON TRANSITIONS
Electrons on the surface of liquid helium N80-28212
ELECTRONIC CONTROL
Remote optical control and switching in optical fiber links
[AD-A083859] N80-28180
ELECTRONIC EQUIPMENT
Procedural attachment
[AD-A084637] N80-28092
ELECTRONIC EQUIPMENT TESTS
Orbiter S-band direct link system verification test report
[NASA-TM-81110] N80-27414
ELECTRONYSTAGMOGRAPHY
Generalized nystagmometric characteristics for diagnostic purposes N80-28034
ELECTROPHYSIOLOGY
Effect of immobilization on the EEG of the baboon. Comparison with telemetry results from unrestricted animals
[NASA-TM-78137] N80-27987
ELEMENTARY EXCITATIONS
Superconductor insulator superconductor quasiparticle tunnel junctions as microwave receivers N80-28214
ELLIPTIC DIFFERENTIAL EQUATIONS
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
Collocation methods for elliptic partial differential equations N80-28094
Direct elliptic equation solvers with low memory requirements
[AD-A084557] N80-28123

ELLIPTIC FUNCTIONS
High order difference methods for quasilinear elliptic boundary value problems on general regions
[AD-A083824] N80-28102
Direct elliptic equation solvers with low memory requirements
[AD-A084557] N80-28123
New method for determining the distances to certain extragalactic radio sources
[NASA-TM-76209] N80-28280
EMBRITTLEMENT
The embrittlement of alloys under impulse thermal, pressure and chemical conditions
[AD-A083743] N80-27476
Electronic effects of sulfur in nickel: A model for grain boundary embrittlement
[AD-A083649] N80-27477
EMISSION SPECTRA
Multicolor inversion diagnostic for tactical motor plumes
[AD-A083904] N80-27426
ENERGETIC PARTICLES
Results of an ISEE-1 experiment to study the interactions between energetic particles and discrete VLF waves in the magnetosphere
[NASA-CR-160006] N80-27421
ENERGY ABSORPTION
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-195269] N80-28262
Identification of superior energy-absorbing materials for school bus interiors. Volume 2: Technical report
[PB80-195277] N80-28263
ENERGY CONSERVATION
Effectiveness of advanced fuel-conservative procedures in the transitional ATC environment N80-27347
Energy conservation potential of general aviation activity
[AD-A081182] N80-27355
CF6-6D engine performance deterioration
[NASA-CR-159786] N80-27364
Solar energy system performance evaluation-seasonal report for Elcam San Diego, San Diego, California
[NASA-CR-161481] N80-27806
ENERGY CONSUMPTION
Coal/oil/water mixture stability, appendix A N80-27502
ENERGY CONVERSION
HYCSOS: Hydride conversion and storage system sensitivity analysis
[ANL/EES-TM-63] N80-27523
Wind characteristics for design of wind turbines: Research in the USA
[PNL-SA-7967] N80-27817
Energy programs at the Johns Hopkins University Applied Physics Laboratory
[PB80-163686] N80-27825
ENERGY DISSIPATION
Radiation coupled dynamics of rem confined radio sources N80-27551
Electron energy dissipation in layered media N80-27600
ENERGY POLICY
CF6-6D engine performance deterioration
[NASA-CR-159786] N80-27364
Satellite Power Systems(SPS): Concept development and evaluation program, preliminary assessment
[DOE/ER-0041] N80-27404
Current status of the Canadian coal-oil mixture program N80-27496
Use of petroleum-based correlations and estimation methods for synthetic fuels
[NASA-TM-81533] N80-27509
Hydrolyzed wood slurry flow modeling — hydrocarbon fuel production
[LBL-10090] N80-27703
Solar heating system installed at Stamford, Connecticut
[NASA-CR-161436] N80-27800
Solar energy system performance evaluation: Seasonal report for Contemporary-Manchester, Manchester, New Hampshire
[NASA-CR-161471] N80-27802
Feasibility study of aileron and spoiler control systems for large horizontal axis wind turbines
[NASA-CR-159656] N80-27803
Impact of propulsion system R and D on electric vehicle performance and cost
[NASA-TM-81548] N80-27805
Solar energy system performance evaluation-seasonal report for Elcam San Diego, San Diego, California
[NASA-CR-161481] N80-27806
ASHMET: A computer code for estimating insolation incident on tilted surfaces
[NASA-TM-78286] N80-27807
Solar power satellite system definition study. Volume 1: Executive summary, phase 3
[NASA-CR-160742] N80-27809
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
Solar power satellite system definition study. Volume 4: Solid states SPS Analysis, phase 3
[NASA-CR-160745] N80-27812
Solar power satellite system definition study. Volume 5: Space transportation analysis, phase 3
[NASA-CR-160746] N80-27813
Evaluation of the vertical axis wind turbine at DREO
[AD-A083961] N80-27814
Investigation of heat storages with salt hydrate as storage medium based on the extra water principle
[EUR-6646-PT-2] N80-27816
Community impediments to implementation of solar energy
[DOE/EV-0059] N80-27821
Solar process heat. Citations from the NTIS data base
[PB80-807936] N80-27823
Energy programs at the Johns Hopkins University Applied Physics Laboratory
[PB80-163686] N80-27825
Comparative study of energy accounting for heavy ion fusion with various driver accelerators
[IPPJ-454] N80-28195
US energy assistance to developing countries: Clarification and coordination needed
[PB80-162720] N80-28244
Phase 1 of the near term hybrid passenger vehicle development program
[NASA-CR-163219] N80-28245
Phase 1 of the near term hybrid passenger vehicles development program. Appendix A: Mission analysis and performance specification studies, volume 1
[NASA-CR-163220] N80-28246
Phase 1 of the near term hybrid passenger vehicle development program, appendix A: Mission analysis and performance specification studies. Volume 2: Appendices
[NASA-CR-163221] N80-28247
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies, volume 1
[NASA-CR-163222] N80-28248
Phase 1 of the near term hybrid passenger vehicle development program. Appendix C: Preliminary design data package, volume 1
[NASA-CR-163223] N80-28249
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies. Volume 2: Appendices
[NASA-CR-163224] N80-28250
Phase 1 of the near term hybrid passenger vehicle development program. Appendix C: Preliminary design data package. Volume 2: Appendices
[NASA-CR-163225] N80-28251
Phase 1 of the near term hybrid passenger vehicle development program. Appendix D: Sensitivity analysis
[NASA-CR-163226] N80-28252
Small passenger car transmission test-Chevrolet 200 transmission
[NASA-CR-159835] N80-28255
ENERGY SOURCES
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T2] N80-27514
ENERGY SPECTRA
The X-ray spectrum of QSO 0241+622 — OSO-8 observations
[NASA-TM-80645] N80-28289
ENERGY STORAGE
HYCSOS: Hydride conversion and storage system sensitivity analysis
[ANL/EES-TM-63] N80-27523
Solid polymer electrolyte fuel cell technology program
[NASA-CR-160734] N80-27801
Evaluation of the vertical axis wind turbine at DREO
[AD-A083961] N80-27814
Investigation of cadmium selenide photoelectrochemical cells
[AD-A083690] N80-27815
Hydrogen technology: Foreign, change 1
[AD-A083885] N80-27816
Hydrogen compatibility of structural materials for energy storage and transmission
[SAND-80-8202] N80-27820
ENERGY TECHNOLOGY
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Overview of R&D status on COM technology in Japan N80-27495
Current status of the Canadian coal-oil mixture program N80-27496
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498
Combustion of coal-oil mixtures in a 700 HP watertube boiler N80-27504
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
Design consideration of fine COM storage N80-27506
Coal gasification technology. Citations from the NTIS data center
[PB80-808062] N80-27527
Hydrogen technology: Foreign, change 1
[AD-A083885] N80-27816
Community impediments to implementation of solar energy
[DOE/EV-0059] N80-27821
Undeveloped hydropower as a potential energy source in Idaho
[PB80-157399] N80-27824
Energy programs at the Johns Hopkins University Applied Physics Laboratory
[PB80-163686] N80-27825
Analysis of code related responses from the solar demonstration program
[PB80-153968] N80-27827
ENERGY TRANSFER
Energy transport in the Earth-atmosphere system and the radiation balance N80-27744
Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28169
Energy transport in harmonic lattices N80-28219
ENGINE DESIGN
Loss model for off-design performance analysis of radial turbines with pivoting-vane, variable-area stators
[NASA-TM-81532] N80-27365
ENGINE TESTS
Inert gas ion thruster development
[NASA-CR-159805] N80-27424
ENTRY GUIDANCE (STS)
Shuttle program. MCC Level C formulation requirements: Entry guidance and entry autopilot
[NASA-TM-81093] N80-27408
Shuttle program. MCC level C formulation requirements: Shuttle TAEM guidance and flight control
[NASA-TM-81094] N80-27409
ENVIRONMENT EFFECTS
Annoyance due to noise and air pollution to the residents of heavily frequented streets
[NASA-TM-75496] N80-27833
A continuation of base-line studies for environmentally monitoring space transportation systems at John F. Kennedy Space Center. Executive summary
[NASA-CR-163122] N80-27836
Land use and environmental impacts of decentralized solar energy use
[DOE/EV-0067] N80-27843
Research perspective: Time-of-day effects on noise annoyance N80-28152

ENVIRONMENTAL CONTROL
Research hardware and habitat of animals used in experiment aboard Cosmos-936 biosatellite N80-28019
Principal results of physiological experiments with mammals aboard the Cosmos-936 biosatellite N80-28020
Semicircular canal function in rats after flight aboard the Cosmos-936 biosatellite N80-28021
ENVIRONMENTAL ENGINEERING
Construction and application of a questionnaire for the social scientific investigation of environmental noise effects
[NASA-TM-75492] N80-27835
ENVIRONMENTAL MONITORING
The GSFC Mark-2 three band hand-held radiometer --- thematic mapper for ground truth data collection
[NASA-TM-80641] N80-27674
Large Antenna Multifrequency Microwave Radiometer (LAMMR) system design
[NASA-TM-80685] N80-27675
Ozone monitoring from space N80-27752
Snowpack monitoring in North America and Eurasia using passive microwave satellite data
[NASA-TM-80706] N80-27779
Annoyance due to noise and air pollution to the residents of heavily frequented streets
[NASA-TM-75496] N80-27833
A continuation of base-line studies for environmentally monitoring space transportation systems at John F. Kennedy Space Center. Executive summary
[NASA-CR-163122] N80-27836
A preliminary look at AVE-SESAME 2 conducted on 19-20 April 1979
[NASA-TM-78280] N80-27916
True-integrating environmental noise monitor and sound-exposure level meter. Volume 4: Mechanical construction and electrical check out
[AD-A083321] N80-28155
True-integrating environmental noise monitor and sound-exposure level meter. Volume 3: Microprocessor program and data interface description
[AD-A083320] N80-28156
ENVIRONMENTAL QUALITY
Time-of-Day Corrections to Aircraft Noise Metrics
[NASA-CP-2135] N80-28150
ENVIRONMENTAL SURVEYS
A continuation of base-line studies for environmentally monitoring space transportation systems at John F. Kennedy Space Center. Executive summary
[NASA-CR-163122] N80-27836
ENVIRONMENTAL TESTS
Evaluation of a proposed ASTM (American Society for Testing and Materials) standard guide to assess the compatibility of metal-heat transfer liquid pairs in solar heating and cooling systems
[PB80-161748] N80-27826
ENZYME ACTIVITY
Activity of some hepatic enzymes and lipogenetic processes in rat aipose tissue after space flight --- effects of weightlessness N80-28000
Secretion, incretion and resecretion of pancreatic lipase during prolonged restriction of motor activity N80-28010
Effect of hypokinesia on invertase activity of the mucosa of the small intestine
[NASA-TM-76191] N80-28039
Characteristics of enzymatic induction provoked by chlordane
[NASA-TM-76194] N80-28047
EPINEPHRINE
Calorigenic effect of adrenaline in rats under conditions of restricted motor activity
[NASA-TM-76192] N80-27988
EPITAXY
High resistivity molecular beam epitaxial AlGaAs for device applications
[AD-A083778] N80-28221
EPOXY RESINS
Fatigue behavior of Hercules 3501-6 epoxy resin
[AD-A083494] N80-27487
EQUATIONS OF MOTION
Effect of some structural parameters on elastic rotor loads by an iterative harmonic balance N80-27348
Air to air helicopter fire control equations and software generation
[AD-A084115] N80-27359
The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419
Free vibrations of a concentric circular conical beam with a concentric circular cylindrical bore
[AD-A083292] N80-27724
The primer vector in linear, relative-motion equations --- spacecraft trajectory optimization
[NASA-TM-81111] N80-28096
EQUATIONS OF STATE
Surveys of high-pressure effects in solids
[AD-A083728] N80-27722
Phase equilibrium of light gases and heavy hydrocarbons at elevated temperatures and pressures N80-28225
EQUATORIAL ATMOSPHERE
Nonlinear equatorial spread F: Spatially large bubbles resulting from large horizontal scale initial perturbations
[AD-A083393] N80-27903
EQUATORIAL ELECTROJET
Numerical simulation and theory of strong ionospheric gradient-drift turbulence N80-27864
EQUILIBRIUM EQUATIONS
Coincident bifurcation of equilibrium and periodic solutions of evolution equations
[AD-A083810] N80-28101
EQUILIBRIUM FLOW
An investigation of the structure of equilibrium turbulent boundary layers N80-27653
Equilibrium boundary layers over very rough surfaces N80-27654
Steady state magnetic diffusion from resistive interchange modes
[AD-A083915] N80-28199
EROSION
Liquid impact erosion mechanisms in transparent materials
[AD-A084267] N80-27491
EROSIVE BURNING
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498
ERROR ANALYSIS
The evaluation of a methodology to measure manual digitizing error in cartographic data bases N80-27761
Reducing the error of geoid undulation computations by modifying Stokes' function
[NASA-CR-163316] N80-27872
ERROR CORRECTING CODES
Potential use of high frequency data transmission for oceanic air traffic control improvement
[AD-A075810] N80-27313
Correction procedures for aircraft noise data. Volume 1: Pseudotones
[AD-A081962] N80-28157
Correction procedures for aircraft noise data. Volume 2: Background noise considerations
[AD-A082011] N80-28158
ERROR DETECTION CODES
Formal techniques for fault-tolerance in Distributed Data Processing (DDP)
[AD-A084537] N80-28059
ERROR FUNCTIONS
A Monte Carlo approach to the sampling error of estimates of the generalizability statistics from a two facet completely crossed generalizability study N80-28127
ERRORS
Statistical investigation of the propagation of random and non-random errors in block aerotriangulation systems N80-27763
ESTIMATING
Remote sensing of soil moisture content over bare fields at 1.4 GHz frequency
[NASA-TM-80711] N80-27780
Rates of convergence for estimation and testing in multinomial distributions N80-28125
Recursive estimation in time series models N80-28131
ETHYL ALCOHOL
Rapid ethanol production via fermentation
[LBL-10219] N80-27519
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9909] N80-27521
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9220] N80-27522
EULER-LAGRANGE EQUATION
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
EUROPE
Air traffic in NATO Europe: Its characteristics and its needs N80-27325
Data link: The key to improvements in civil/military air traffic management? N80-27330
Seismotectonic evaluation of Europe, excluding the Balkans N80-27887
The European-Mediterranean Seismological Centre (EMSC) N80-27891
EVAPORATORS
Heat and mass transfer from a rotating disk with phase change N80-27625
EXCIMER LASERS
Computer program for the kinetics and populations in a xenon fluoride laser
[AD-A084459] N80-27690
EXCITATION
Multiphoton dissociation of polyatomic molecules N80-28163
Experimental studies of excited metallic phases in stressed germanium N80-28205
EXHAUST EMISSION
Effect of ambient temperature on vehicle emissions and performance factors
[PB80-162753] N80-27704
Federal Aviation Administration high altitude pollution program, second biennial report, prepared in accordance with the Ozone Protection provision, section 153g, of the Clean Air Act Amendments of 1977
[AD-A081520] N80-27841
DRAFT recommended practice for measurement of gaseous and particulate emissions from heavy-duty diesel engines under transient conditions
[PB80-153943] N80-27844
Study of New England utilities' particulate air pollution control facilities to determine relative viability of approaches to upgrade and retrofit
[PB80-154073] N80-27849
Empirical studies of the relationships between emissions and visibility in the Southwest
[PB80-156136] N80-27904
EXHAUST GASES
Semi-empirical correlations for gas turbine emissions, ignition, and flame stabiliztion N80-27393
EXOBIOLOGY
USSR Report: Space Biology and Aerospace Medicine, volume 14, no. 3, 1980
[JPRS-75956] N80-27994
USSR Report. Space Biology and Aerospace Medicine, volume 14, no.2, 1980
[JPRS-75654] N80-28015
EXPERIMENTAL DESIGN
Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403
EXPLOSIONS
Muzzle blast overpressure levels on the AH-1S heliocopter tow sight unit
[AD-A084027] N80-27352
EXPLOSIVES
Analytical models for the compressive heating ignition of high explosives
[AD-A083889] N80-27460
EXTERNAL STORE SEPARATION
Data report for an extensive store separation test program conducted at supersonic speeds
[AD-A083848] N80-27290
EXTERNAL STORES
Mutual interference of multiple bodies in the flow field of the F-4C aircraft in the transonic speed range --- wind tunnel tests
[AD-A084704] N80-27296
EXTRAGALACTIC RADIO SOURCES
Radiation coupled dynamics of ram confined radio sources N80-27551
New method for determining the distances to certain extragalactic radio sources
[NASA-TM-76209] N80-28280
EXTREMUM VALUES
Extreme value theory for continuous parameter stationary processes
[AD-A083802] N80-28103
EYE (ANATOMY)
Transient diffusion in multi-layer biological tissue N80-27979

EYE MOVEMENTS
Generalized nystagmometric characteristics for diagnostic purposes N80-28034

F

F REGION
Gradient scattering theory demonstrates that VHF, spread-F radar backscatter reveals streaming instabilities
[AD-A084644] N80-27571
A discussion of artic ionograms
[AD-A083550] N80-27898
Effects of impulsive heating events on F-region chemistry and electron density
[AD-A083333] N80-27902
A power model for plasma convection — f region scenarios
[AD-A084653] N80-28203

F 2 REGION
HF (High-Frequency) radio noise in the topside ionosphere
[PB80-162670] N80-27591

F-4 AIRCRAFT
Mutual interference of multiple bodies in the flow field of the F-4C aircraft in the transonic speed range --- wind tunnel tests
[AD-A084704] N80-27296
The F-4 service life tracking program crack growth gages
[AD-A083978] N80-27353

FABRICATION
Screen printing technology applied to silicon solar cell fabrication
[NASA-CR-159789] N80-27808

FABRY-PEROT INTERFEROMETERS
Global wind determination by interferometric techniques in the troposphere stratosphere and mesosphere N80-27759

FAILURE ANALYSIS
Graphical techniques in reliability theory N80-27707

FAILURE MODES
Reynolds stress closures: Status and prospects N80-27660

FAR INFRARED RADIATION
Tunable far-infrared radiation generated by a Josephson junction N80-28207

FAR ULTRAVIOLET RADIATION
Stellar extreme ultraviolet spectroscopy N80-28265
IUE observations of a luminous M supergiant that exhibits intense continuum in the far ultraviolet
[NASA-TM-80681] N80-28273

FAST FOURIER TRANSFORMATIONS
A simple derivation of Glassman's general N fast Fourier transform
[AD-A083811] N80-28104

FATIGUE (MATERIALS)
Analysis of life prediction methods for time-dependent fatigue crack initiation in nickel-base superalloys
[PB80-158116] N80-27481
Fatigue behavior of Hercules 3501-6 epoxy resin
[AD-A083494] N80-27487

FEASIBILITY ANALYSIS
System description and analysis. Part 1: Feasibility study for helicopter/VTOL wide-angle simulation image generation display system
[NASA-CR-152376] N80-27397
Shuttle program. STS-7 feasibility assessment: IUS/TDRS-A
[NASA-TM-81091] N80-27406
Startup and initial feasibility testing on the Salem Harbor COM demonstration N80-27499
Feasibility study for the teletransmission of data from geophysical network installed in a seismic area to an operational center N80-27878

FEDERAL BUDGETS
Authorizing appropriations of the National Aeronautics and Space Administration
[HR-REPT-96-1142] N80-28242
NASA authorization, 1981, volume 4
[GPO-61-147] N80-28243

FEEDBACK CONTROL
Communication over a quantum channel with feedback N80-27552
Control of nonlinear systems
[AD-A083963] N80-28089

FERMENTATION
Rapid ethanol production via fermentation
[LBL-10219] N80-27519

FERRITIC STAINLESS STEELS
Iron-based alloys strengthened by ternary Laves phases --- precipitation hardening
[PB80-157233] N80-27480

FERROMAGNETIC MATERIALS
Current-carrying plasma in ferromak
[IPPJ-458] N80-28191
Interactions in solids N80-28218

FIBER COMPOSITES
The statistical strength of fibrous materials as influenced by fiber load-sharing and geometric configuration N80-27427

FIBER OPTICS
Remote optical control and switching in optical fiber links
[AD-A083659] N80-28180
Manufacturing methods and technology program for ruggedized tactical fiber optic cable
[AD-A084191] N80-28182

FIBER STRENGTH
The statistical strength of fibrous materials as influenced by fiber load-sharing and geometric configuration N80-27427

FIELD EFFECT TRANSISTORS
Noncoplanar high power FET
[AD-A083682] N80-27607
High resistivity molecular beam epitaxial AlGaAs for device applications
[AD-A083778] N80-28221

FIELD THEORY (PHYSICS)
A fiber bundle approach to unified field theory N80-28224

FILE MAINTENANCE (COMPUTERS)
Data base management. Citations from the NTIS data base
[PB80-808165] N80-28228
Data base management. Citations from the NTIS data base
[PB80-808157] N80-28230

FILM THICKNESS
Fully flooded elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81543] N80-27698
Starved elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81549] N80-27699

FINITE DIFFERENCE THEORY
An alternative approach to the numerical simulation
[NASA-TM-81542] N80-27286
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390
Predictor-corrector methods for time dependent compressible flows N80-27619
Finite difference solution of the nonlinear Cosserat jet equations for a viscous fluid with surface tension N80-27626
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632

FINITE ELEMENT METHOD
Finite element analysis of transonic flows
[AD-A084636] N80-27295
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543
Research on numerical algorithms for the three dimensional Navier-Stokes equations. 1: Accuracy, convergence and efficiency
[AD-A083664] N80-27633
Finite element methods for heat transfer problems
[AD-A084450] N80-27641
Finite Element Analysis Program (FEAP) for conduction heat transfer
[AD-A084522] N80-27645
Finite element modelling of torsional eigenvibrations of the Earth N80-27854
Structural parameter identification of member characteristics in a finite element model N80-28095

FIRE CONTROL
Air to air helicopter fire control equations and software generation
[AD-A084115] N80-27359

FIRE PREVENTION
Fire-resistant hydraulic fluid safety
[PB80-159486] N80-27544

FISHES
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 --- ocean farming
[PB80-157662] N80-27795

FLAME PROPAGATION
Theoretical study of a reaction-diffusion model for flame propagation in a gas N80-27440

FLAME SPECTROSCOPY
Saturated atomic fluorescence as a diagnostic tool for flames and plasmas N80-27439

FLAME SPRAYING
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381

FLAME STABILITY
Semi-empirical correlations for gas turbine emissions, ignition, and flame stabiliztion N80-27393

FLAMES
Turbulent reaction and transport phenomena in jet flames N80-27376
Development and verification of radiation models N80-27380
Laser induced fluorescence spectroscopy of OH in flames N80-27683

FLAMMABILITY
Development of flammability criteria for transformer dielectric fluids
[PB80-163777] N80-27612
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-165269] N80-28262
Identification of superior energy-absorbing materials for school bus interiors. Volume 2: Technical report
[PB80-165277] N80-28263

FLAT PLATES
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700

FLEXIBILITY
Patching flexible and rigid pavements
[PB80-161243] N80-27541

FLIGHT CONDITIONS
Human color discriminating function with muscular tension during exposure to vestibular stimuli N80-28004

FLIGHT MECHANICS
STS-1 operational flight profile. Volume 3: Ascent, cycle 3
[NASA-TM-81096] N80-27411
STS-1 operational flight profile. Volume 5: Descent, cycle 3. Appendix C: Monte Carlo dispersion analysis
[NASA-TM-81097] N80-27412
STS-1 operational flight profile. Volume 6: Abort analysis
[NASA-TM-81098] N80-27413
Biological and aerodynamic problems with the flight of animals
[NASA-TM-75337] N80-27985

FLIGHT SAFETY
The 1976 accident experience of civilian pilots with static physical defects
[AD-A077189] N80-27304
Probabilities of vertical overlap: A sensitivity analysis --- vertical separation standards for aircraft
[PB80-161151] N80-27323
Air traffic in NATO Europe: Its characteristics and its needs N80-27325
Helicopter air traffic management systems with civil/military interoperability N80-27326
A study for development of methods for air traffic management N80-27327
System, airspace, and capacity requirements for future ATC-systems N80-27328
Determination of the safety in a North Atlantic organized track system with reduced lateral separation --- statistical tests N80-27332

FLIGHT SIMULATORS
An evaluation of aircraft separation assurance concepts using airline flight simulators. Volume 1: Study report
[AD-A083986] N80-27310
An evaluation of aircraft separation assurance concepts using airline flight simulators. Volume 2: Appendices
[AD-A083897] N80-27311

FLIGHT TESTS
Data report for an extensive store separation test program conducted at supersonic speeds
[AD-A083848] N80-27290
West Coast LORAN-C flight test
[AD-A084039] N80-27307
FLOOD CONTROL
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
FLOOD PLAINS
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793
FLORIDA
A continuation of base-line studies for environmentally monitoring space transportation systems at John F. Kennedy Space Center. Executive summary
[NASA-CR-163122] N80-27836
FLOW CHARACTERISTICS
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
Developments in the computation of turbulent boundary layers N80-27658
A Navier-Stokes fast solver for turbulence modeling applications N80-27659
Large eddy simulation of turbulent channel flow: ILLIAC 5 calculation N80-27661
Some observations of the structure of the turbulent boundary layer N80-27672
FLOW DISTRIBUTION
Mutual interference of multiple bodies in the flow field of the F-4C aircraft in the transonic speed range --- wind tunnel tests
[AD-A084704] N80-27296
Combustor modelling for scramjet engines N80-27379
Flow field measurement using Raman and LDV techniques
[AD-A083767] N80-27635
Summary of the AFOSR/MSU Research Specialists Workshop on Coherent Structure in Turbulent Boundary Layers
[AD-A083717] N80-27637
An experimental study of inward and outward flow in a turbulent boundary layer N80-27649
Experimental study of coherent structures in the turbulent boundary layer of pipe flow using laser-Doppler anemometry N80-27650
Turbulent boundary layer at low and high subsonic speeds N80-27651
Coherent structures in time dependent shear flows N80-27652
An investigation of the structure of equilibrium turbulent boundary layers N80-27653
Equilibrium boundary layers over very rough surfaces N80-27654
Turbulence behavior in a shock wave/boundary layer interaction N80-27655
Developments in the computation of turbulent boundary layers N80-27658
Hydrolyzed wood slurry flow modeling --- hydrocarbon fuel production
[LBL-10090] N80-27703
A primal simplex variant for the maximum flow problem
[AD-A084282] N80-28145
FLOW EQUATIONS
CHEMEQ: A subroutine for solving stiff ordinary differential equations
[AD-A083545] N80-28097
A nonlinear Volterra equation in variable domain --- nonlinear heat flow equation
[AD-A083829] N80-28107
FLOW GEOMETRY
An experimental study of inward and outward flow in a turbulent boundary layer N80-27649
FLOW MEASUREMENT
Capillary flowmeters for a accurate, stable flows of gases
[AD-A083874] N80-27677
Turbine flowmeters and their applications at the Naval Air Propulsion Center
[AD-A084181] N80-27680
Holographic flow visualization. Citations from the Engineering Index data base
[PB80-806207] N80-27682
FLOW STABILITY
Equilibrium boundary layers over very rough surfaces N80-27654
Evidence for instability-waves in the velocity-field of a fully developed turbulent channel-flow N80-27667
FLOW VELOCITY
Evidence for instability-waves in the velocity-field of a fully developed turbulent channel-flow N80-27667
FLOW VISUALIZATION
An experimental study of the coherent motions in an axisymmetric mixing layer N80-27620
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction
[AD-A083703] N80-27639
Turbulent Boundary Layers: Experiments, Theory and Modeling --- conference
[AGARD-CP-271] N80-27647
Flow visualization of turbulent boundary layer structure N80-27671
Resonant Doppler velocimeter --- flow visualization N80-27673
Holographic flow visualization. Citations from the NTIS data base
[PB80-808199] N80-27681
Holographic flow visualization. Citations from the Engineering Index data base
[PB80-808207] N80-27682
FLUID DYNAMICS
Documentation of cascade unsteady pressure difference program
[AD-A083987] N80-27368
Coupled bending-torsion flutter in cascades with applications to fan and compressor blades N80-27396
Colloquim on flow separation
[AD-A083741] N80-27636
FLUID FILMS
Dynamic analysis of noncontacting face seals
[NASA-TM-79294] N80-27695
FLUID FILTERS
Anaerobic-activated carbon filters for the removal of refractory and toxic organic compounds in wastewater
[PB80-164254] N80-28250
FLUID FLOW
Development and verification of radiation models N80-27380
A study of persistent current in superfluid 4He N80-27528
The boundary integral equation method applied to free surface flow problems in porous media N80-27762
Instrumentation for the measurement of viscosity and flow of biological fluids --- neuclear magnetic resonance N80-27980
FLUID MECHANICS
Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403
Separation effects in gas-particle flows at high Reynolds numbers N80-27622
Finite difference solution of the nonlinear Cosserat jet equations for a viscous fluid with surface tension N80-27626
Finite element methods for heat transfer problems
[AD-A084450] N80-27641
Digital image analysis of two phase flow data
[AD-A084187] N80-27646
FLUIDIZED BED PROCESSORS
Coal: An alternate fuel for thermal enhanced oil recovery steam generation
[SAN-2418-1] N80-27524
FLUORESCENCE
Saturated atomic fluorescence as a diagnostic tool for flames and plasmas N80-27439
Laser induced fluorescence spectroscopy of OH in flames N80-27683
Laser induced fluorescence of trapped molecular ions N80-28165
FLUORIDES
A study of the nature and origins of pyroelectricity in polyvinylidenefluoride and its co-polymers
[AD-A084448] N80-27490
FLUORINE
Crossed molecular beam study of the reactions of oxygen and fluorine atoms
[AD-A084255] N80-28174
FLUORINE COMPOUNDS
Fluoroalkyleneether silicate/viton GLT blends for hydraulic system seals: Synthesis, blending, and testing
[AD-A084708] N80-27701
FLUORO COMPOUNDS
X-ray absorption studies of graphite intercalates and metal-ammonia solutions --- arsenic fluorocomplexes and rubidium-ammonia N80-28213
FLUOROPOLYMERS
Piezoelectricity in nylon 11
[AD-A083719] N80-27609
FLUTTER ANALYSIS
Flutter analysis of a two-dimensional and two-degree-of-freedom supercritical airfoil in small-disturbance unsteady transonic flow
[AD-A084172] N80-27291
Coupled bending-torsion flutter in cascades with applications to fan and compressor blades N80-27396
FOCUSING
Focal axis resolver for offset reflector antennas
[NASA-TM-80683] N80-27555
FOG
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
FORCE DISTRIBUTION
Force balancing machines and optimization of dynamic relations for planar mechanisms N80-27693
FORECASTING
FAA aviation forecastings, fiscal years 1980 - 1991
[AD-A075382] N80-27275
FORESTS
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
FORMALDEHYDE
Shock tube studies of the N2O/CH4/CO/Ar systems
[AD-A083722] N80-27455
FORMING TECHNIQUES
The effects of non-carbide forming elements on the mechanical properties and microstructure of a secondary hardening steel N80-27465
FORTRAN
Using ANS FORTRAN
[PB80-168545] N80-28082
FORWARD SCATTERING
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
FOURIER TRANSFORMATION
The 1H and 13C Fourier transform NMR characterization of jet fuels derived from alternated energy sources
[AD-A084169] N80-27513
The atmospheric general circulation model N80-27929
FRACTURE MECHANICS
The effect of microstructure on the properties of high strength aluminum alloys
[AD-A083768] N80-27474
Development and application of a computational shear band model
[AD-A084029] N80-27721
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083871] N80-27723
Plastic deformation and ductile fracture at an angle slit in a sheet under tension
[AD-A084564] N80-27726
Stress crack phenomena. Citations from the NTIS data base
[PB80-807886] N80-27730
Stress crack phenomena. Citations from the NTIS data base
[PB80-807878] N80-27731
FRAGMENTATION
Development and application of a computational shear band model
[AD-A084029] N80-27721

FRAMES
Optimum inelastic design of seismic-resistant reinforced concrete frame structures
[PB80-164635] N80-27532
FRANCE
Standardization in France
[PB80-162126] N80-27539
FREE CONVECTION
A new theory of turbulent convection over a heated surface N80-27623
FREE ELECTRON LASERS
Free electron lasers with variable parameter wigglers
[AD-A084323] N80-27689
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
FREE VIBRATION
Large deflection and large-amplitude free vibrations of laminated composite-material plates
[AD-A084070] N80-27436
Free vibrations of a concentric circular conical beam with a concentric circular cylindrical bore
[AD-A083292] N80-27724
FRENCH SATELLITES
The High Visible Resolution (HVR) instrument of the spot ground observation satellite
[NASA-TM-75830] N80-27781
FREQUENCY ASSIGNMENT
Sharing of the band 12.2-12.7 GHz between the broadcasting-satellite and fixed services
[PB80-157423] N80-27590
FREQUENCY MODULATION
Semiconductor measurment technology: Modulation measurements for microwave mixers
[PB80-166952] N80-27618
FRICTION
Performance of open-graded friction courses
[PB80-162965] N80-27531
Frictional resistance of pavements
[PB80-162662] N80-27537
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700
FUEL CELLS
Solid polymer electrolyte fuel cell technology program
[NASA-CR-160734] N80-27801
FUEL COMBUSTION
Chemical kinetic modelling for combustion application N80-27383
Semi-empirical correlations for gas turbine emissions, ignition, and flame stabiliztion N80-27393
Combustion modelling within gas turbine engines, some applications and limitations N80-27394
The fate and behavior of fuel-sulfur in combustion systems N80-27422
Overview of R&D status on COM technology in Japan N80-27495
Current status of the Canadian coal-oil mixture program N80-27496
Combustion of coal-oil mixtures in a 700 HP watertube boiler N80-27504
Pilot plant test on coarse COM system. Tests on transportation, de-oiling and combustion of coarse COM N80-27508
FUEL CONSUMPTION
Effectiveness of advanced fuel-conservative procedures in the transitional ATC environment N80-27347
Energy conservation potential of general aviation activity
[AD-A081182] N80-27355
Performance, emissions, and physical characteristics of a rotating combustion aircraft engine, supplement A
[NASA-CR-135119] N80-27361
CF6-6D engine performance deterioration
[NASA-CR-159786] N80-27364
Phase 1 of the near term hybrid passenger vehicle development program
[NASA-CR-163219] N80-28245
FUEL INJECTION
Combustor modelling for scramjet engines N80-27379
FUEL OILS
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Overview of R&D status on COM technology in Japan N80-27495
Current status of the Canadian coal-oil mixture program N80-27496
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497
Coal-oil mixture combustion applied to Canadian utility boilers N80-27498
Stable coal/fuel oil dispersions N80-27503
Combustion of coal-oil mixtures in a 700 HP watertube boiler N80-27504
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
Design consideration of fine COM storage N80-27506
Report on pumping characteristic tests and piping pressure loss measurement tests for fine COM N80-27507
Pilot plant test on coarse COM system. Tests on transportation, de-oiling and combustion of coarse COM N80-27508
Effect on combined cycle efficiency of stack gas temperature constraints to avoid acid corrosion
[NASA-TM-81531] N80-27804
FUEL PRODUCTION
Coal liquefaction technology. Citations from the NTIS data base
[PB80-808108] N80-27526
FUEL SYSTEMS
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Overview of R&D status on COM technology in Japan N80-27495
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497
FUEL TANKS
Design consideration of fine COM storage N80-27506
FUEL-AIR RATIO
Coalescence/dispersion modelling of gas turbine combustors N80-27384
FUELS
Fuel property effects on combustor performance
[AD-A084017] N80-27511
FUNCTION GENERATORS
A general mixture-truncation method for generating bivariate random variables from univariate generators
[AD-A084474] N80-28138
FUNCTIONS (MATHEMATICS)
Generalizing the iterative proportional fitting procedure
[AD-A084429] N80-28118
The HEAO A-2 survey of Abell clusters and the X-ray luminosity function
[NASA-TM-80680] N80-28290
FURNACES
Survey on prediction procedures for the calculation of furnace performance --- heat transfer models N80-27387
Modeling furnances fed with oxygen-enriched air N80-27389
An effective probabiliatic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390
FUSION REACTORS
Surface study of fusion research in universities linkage organization
[!PPJ-455] N80-28196

G

GALACTIC CLUSTERS
Broadband photometry of galaxies in two distant clusters with a charge-coupled device camera N80-28270
The HEAO A-2 survey of Abell clusters and the X-ray luminosity function
[NASA-TM-80680] N80-28290
GALACTIC NUCLEI
Airborne infrared spectroscopy of ionized hydrogen regions and the galactic center N80-28266
Infrared fine-structure line emission from the galactic center N80-28269
GALACTIC STRUCTURE
Low surface brightness spiral galaxies N80-28264
The distribution of G5-K5 stars in a region at the South Galactic Pole N80-28276
On the stability and dynamics of disk galaxies: Considerations on the axisymmetric background N80-28277
A neutral hydrogen survey of blue compact galaxies N80-28278
GALAXIES
X-ray spectral constraints on the broad-line cloud geometry of NGC 4151
[NASA-TM-80726] N80-27915
Broadband photometry of galaxies in two distant clusters with a charge-coupled device camera N80-28270
Infrared studies of AFGL sources --- Air Force Geophysical Laboratory infrared catalog
[AD-A084713] N80-28274
On the stability and dynamics of disk galaxies: Considerations on the axisymmetric background N80-28277
GALILEO PROJECT
Shape change of Galileo probe models in free-flight tests
[NASA-TM-81209] N80-27418
GALLIUM ARSENIDES
Oxidation of gallium arsenide in a plasma multipole device. Study of the MOS structures obtained
[NASA-TM-75471] N80-27451
GAME THEORY
Algorithms for solving some undiscounted stochastic games N80-28142
GAS ANALYSIS
The fate and behavior of fuel-sulfur in combustion systems N80-27422
GAS CHROMATOGRAPHY
Program documentation for the gas chromatography automation system N80-27464
Isolation and gas chromatographic demonstration of volatile organic substances in thin-layer biological samples N80-28014
GAS DYNAMICS
Muzzle blast overpressure levels on the AH-1S heliocopter tow sight unit
[AD-A084027] N80-27352
Calculation of the laminar viscosity of a gaseous mixture for gas dynamic mixing comparisons for a reacting shear layer
[AD-A083970] N80-27640
GAS EVOLUTION
Ultrasonic method of recording gas bubbles in animal venous blood in a rarefied atmosphere N80-28013
GAS EXPANSION
HI shells in the galaxy N80-28267
GAS FLOW
Computational approaches to the study of reactive flow mixing
[AD-A083912] N80-27457
Analysis of algorithms for advection in discontinuous flows N80-27629
Capillary flowmeters for a accurate, stable flows of gases
[AD-A083874] N80-27677
GAS LASERS
Visible laser research one meter device
[AD-A084196] N80-27688
GAS MIXTURES
Ignition, combustion, detonation, and quenching of reactive mixtures
[AD-A083737] N80-27456
GAS TRANSPORT
Theoretical analysis of the effect of state of pulmonary circulation on distribution of ventilation-perfusion relations and gas exchange in the lungs N80-28011
Respiration and gas exchange under hyperbaric conditions N80-28016
GAS TURBINE ENGINES
CF6-6D engine performance deterioration
[NASA-CR-159786] N80-27364
Loss model for off-design performance analysis of radial turbines with pivoting-vane, variable-area stators
[NASA-TM-81532] N80-27365
Fundamental modelling of mixing, evaporation and kinetics in gas turbine combustors N80-27373
Mathematical modelling of gas-turbine combustion chambers N80-27374
Semi-empirical correlations for gas turbine emissions, ignition, and flame stabiliztion N80-27393

Combustion modelling within gas turbine engines, some applications and limitations N80-27394

GAS TURBINES
AFOSR Contractors Meeting on Air-Breathing Combustion Dynamics and Kinetics, 1979 Abstracts
[AD-A083651] N80-27367
High-temperature radial turbine demonstration
[AD-A084120] N80-27370
Modeling the combustion chamber of a gas turbine: A mechanics viewpoint N80-27372
Second-order closure modeling of turbulent mixing and reacting flows N80-27378
Fundamental characterization of alternative fuel effects in continuous combustion systems
N80-27382
Coalescence/dispersion modelling of gas turbine combustors N80-27384
Effect on combined cycle efficiency of stack gas temperature constraints to avoid acid corrosion
[NASA-TM-81531] N80-27804

GAS-SOLID INTERACTIONS
Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28169

GAS-SOLID INTERFACES
Separation effects in gas-particle flows at high Reynolds numbers N80-27622
Optical studies of the interface states at GaAs-metal Schottky barrier junctions
[AD-A083758] N80-28220

GASTROINTESTINAL SYSTEM
Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981

GENERAL AVIATION AIRCRAFT
General aviation pilot and aircraft activity survey, conducted in 1978
[AD-A081726] N80-27276
General aviation dynamics: The impact of cost recovery N80-27300
Energy conservation potential of general aviation activity
[AD-A081182] N80-27355

GEODESY
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27859

GEODYNAMICS
A brief summary of a proposed program for earthquake prediction and the study of plate dynamics in southwest Europe N80-27875

GEOIDS
Geoid anomalies in the vicinity of subduction zones
[NASA-TM-80678] N80-27732
Reducing the error of geoid undulation computations by modifying Stokes' function
[NASA-CR-163316] N80-27872

GEOLOGICAL FAULTS
Crustal stress and heat flow measurement in northern Anatolia N80-27883
A first European joint effort in earthquake prediction research N80-27884

GEOLOGICAL SURVEYS
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
Seismotectonic evaluation of Europe, excluding the Balkans N80-27887

GEOMAGNETISM
Magsat scientific investigations
[NASA-TM-80698] N80-27778
The paleomagnetism of the Carboniferous strata in the northern Appalachian basin with applications toward magnetostratigraphy N80-27856
Geomagnetic observations 1978 --- station locations, instruments, and data management
[PB80-146087] N80-27907

GEOMETRICAL OPTICS
Computer prediction of large reflector antenna radiation properties
[NASA-CR-163253] N80-27556

GEOMORPHOLOGY
Application of geomorphic principles to environmental management in semiarid regions
[PB80-169303] N80-27908

GEOPHYSICS
Magsat scientific investigations
[NASA-TM-80698] N80-27778
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona --- Picacho Basin
[PB80-159908] N80-27788
An outline proposal of some aims, strategies and objectives --- in earthquake prediction N80-27886
The Meteosat data collection system and its potential as a data relay for geophysical measurements
N80-27890

GEORGIA
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785

GERMANIUM
Experimental studies of excited metallic phases in stressed germanium N80-28205

GERMANY
Midair conflicts and their potential avoidance by progressive implementation of automation
N80-27331
Construction and application of a questionnaire for the social scientific investigation of environmental noise effects
[NASA-TM-75492] N80-27835

GERT
Graphical techniques in reliability theory
N80-27707

GLACIERS
Ice sheets, glaciers, and climate N80-27742
General circulation model experiments using glacial period and related boundary conditions N80-27934
An energy-balance model of glaciation cycles
N80-27950

GLANDS (ANATOMY)
Role of dynamic space flight factors in the pathogenesis of involution of lymphatic organs (experimental morphological study) N80-28022

GLOBAL ATMOSPHERIC RESEARCH PROGRAM
Climate Models: Performance, intercomparison and sensitivity studies, volume 1 --- conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-1] N80-27917
Climate models: Performance, intercomparison and sensitivity studies, Volume 2 --- conference proceedings, Washington, D.C., 3-7 Apr. 1978
[GARP-PUBL-22-VOL-2] N80-27938

GLOBAL POSITIONING SYSTEM
Interactive nonlinear structural analysis. A review of the GIFTS-STAGS union
[AD-A084209] N80-28073

GOVERNMENT/INDUSTRY RELATIONS
Statistical methods in sole source contract negotiation
[AD-A083983] N80-28227
A regional technology transfer program --- North Carolina Industrial Applications Center for the Southeast
[NASA-CR-163360] N80-28253

GOVERNMENTS
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792

GRAIN BOUNDARIES
Electronic effects of sulfur in nickel: A model for grain boundary embrittlement
[AD-A083649] N80-27477

GRAMMARS
Treatment of ungrammatical and extragrammatical phenomena in natural language understanding systems N80-28064

GRAPHITE
Residual stress measurements on aluminum--graphite composite using X-ray diffraction techniques
[AD-A083795] N80-27437
X-ray absorption studies of graphite intercalates and metal-ammonia solutions --- arsenic fluorocomplexes and rubidium-ammonia N80-28213

GRAPHS (CHARTS)
Shape segmentation using relaxation, 2
[AD-A084292] N80-28116

GRASSES
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T2] N80-27514

GRAVIMETERS
The feasibility study for absolute measurement monitoring of gravity field variations, connected with internal mass variation N80-27879

GRAVITATIONAL EFFECTS
The relation between tilt table and acceleration-tolerance and their dependence on stature and physical fitness
[NASA-TM-75796] N80-28042

GRAVITATIONAL FIELDS
The feasibility study for absolute measurement monitoring of gravity field variations, connected with internal mass variation N80-27879

GRAVITY ANOMALIES
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27859
The feasibility study for absolute measurement monitoring of gravity field variations, connected with internal mass variation N80-27879

GREAT BRITAIN
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

GREAT LAKES (NORTH AMERICA)
Future US phosphorus loadings to the Great Lakes: An integration of water quality management planning information
[PB80-160336] N80-27791
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

GREEN FUNCTION
The boundary integral equation method applied to free surface flow problems in porous media
N80-27762

GROUND STATIONS
Development of an automated Remote Communications Air-Ground (RCAG) monitoring system
[AD-A083754] N80-27567
The Meteosat data collection system and its potential as a data relay for geophysical measurements
N80-27890
The Kloppenheim satellite observation station: Determination of longitude, latitude, and astronomical azimuth with the passage instrument ap 70
N80-28293

GROUND TRUTH
The GSFC Mark-2 three band hand-held radiometer --- thematic mapper for ground truth data collection
[NASA-TM-80641] N80-27674
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774

GROUND WATER
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787
Dewatering systems for surface coal mines
[PB80-160153] N80-27789
Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175

GROUND WAVE PROPAGATION
Investigation of wave frequency at different travel times --- applications to seismic prospecting
[BMFT-FB-T-79-77] N80-27892

GROUND-AIR-GROUND COMMUNICATIONS
Enhanced Terminal Information Services (ETIS) utilizing the Discrete Address Beacon System (DABS) data link-concept description
[AD-A073205] N80-27319
JTIDS: An integrated communications navigation and identification system, and its potential for air traffic management N80-27343

GROWTH
The growth of birdwings
[NASA-TM-75821] N80-27986

GUARDS (SHIELDS)
Development of a rebar dowel anchorage system for attaching the California type 25 concrete barrier to existing bridges
[PB80-161722] N80-27534
GULF OF MEXICO
Physical oceanographic conditions at a potential OTEC site in the Gulf of Mexico, 88 deg W, 29 deg N
[PB80-163710] N80-27978
GULF STREAM
On the simulation of the oceanic general circulation N80-27939
GUNFIRE
Muzzle blast overpressure levels on the AH-1S heliocopter tow sight unit
[AD-A084027] N80-27352
GUNS (ORDNANCE)
Muzzle blast overpressure levels on the AH-1S heliocopter tow sight unit
[AD-A084027] N80-27352
GYROCOMPASSES
Characteristic for a moderate accuracy Inertial Navigation System (INS)
[AD-A084036] N80-27318
GYROSCOPES
Dynamics of a liquid-filled gyroscope: Up-date of theory and experiment
[AD-A083886] N80-27676
Materials research for advanced inertial instrumentation. Task 3: Rare earth magnetic material technology as related to gyro torquers and motors
[AD-A083968] N80-27679

H

HALITES
Sonar probing as a mining and tunneling tool
[PB80-159239] N80-27790
HAMILTONIAN FUNCTIONS
Forced oscillations of nonlinear Hamiltonian systems, 2
[AD-A083812] N80-28100
HARDNESS TESTS
Cost/benefit analysis of reentry vehicle hardness testing using the FAST methodology. Volume 2: Methods
[AD-A083336] N80-27420
HARMONIC ANALYSIS
Harmonic analysis of feedbacks: A transfer function climate model N80-27954
HARMONIC MOTION
Effect of some structural parameters on elastic rotor loads by an iterative harmonic balance N80-27348
Coupled bending-torsion flutter in cascades with applications to fan and compressor blades N80-27396
HARMONIC OSCILLATORS
Energy transport in harmonic lattices N80-28219
HAZARDS
Study of optical techniques for indirect generation of runway approach lights
[AD-A080434] N80-27398
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793
HEAO 1
The HEAO A-2 survey of Abell clusters and the X-ray luminosity function
[NASA-TM-80680] N80-28290
HEART
Effect of hypokinesia on changes in carbohydrate and lipid metabolism in the heart and liver N80-28029
HEAT BALANCE
Models of the ocean circulation and the global heat balance N80-27920
Recent work on heat-balance models N80-27943
Equilibrium climatic zonation deduced from a statistical-dynamical model N80-27945
A severely truncated spectral model N80-27948
An energy-balance model of glaciation cycles N80-27950
A simple sea-ice/ocean-temperature oscillator model N80-27951
Harmonic analysis of feedbacks: A transfer function climate model N80-27954
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models --- latitudinal variation N80-27956
Some comments on the design of model response experiments for multi-time-scale systems N80-27959
HEAT FLUX
Development and verification of radiation models N80-27380
Evolution of deflagration in a cold combustible subjected to a uniform energy flux
[AD-A083822] N80-27461
Numerical methods for inverse transient heat conduction problems N80-27624
The Earth's hydrosphere and cryosphere --- role of ocean circulation in models of climatic changes with emphasis on ocean surface temperature N80-27736
The performance of a seasonal global climatic model --- seasonal cycle of the temperature N80-27944
Performance of the Lawrence Livermore Laboratory zonal atmospheric model --- a general circulation model N80-27947
HEAT OF FORMATION
The critical points of alloys of iron and cobalt during rapid heating
[NASA-TM-75825] N80-27473
HEAT PIPES
Development of a low-cost non-tracking heat pipe concentrating collector
[PB80-160443] N80-27828
HEAT RESISTANT ALLOYS
Iron-based alloys strengthened by ternary Laves phases --- precipitation hardening
[PB80-157233] N80-27480
Analysis of life prediction methods for time-dependent fatigue crack initiation in nickel-base superalloys
[PB80-158116] N80-27481
HEAT STORAGE
Investigation of heat storages with salt hydrate as storage medium based on the extra water principle
[EUR-6646-PT-2] N80-27818
Models of the ocean circulation and the global heat balance N80-27920
HEAT TRANSFER
Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403
Analytical models for the compressive heating ignition of high explosives
[AD-A083889] N80-27460
Heat and mass transfer from a rotating disk with phase change N80-27625
The solution of boundary value problems in diffusive heat and mass transfer with convection: Functional analytic methods N80-27627
Finite element methods for heat transfer problems
[AD-A084450] N80-27641
Numerical solutions for laminar boundary layer behind blast waves
[AD-A084435] N80-27644
Evaluation of a proposed ASTM (American Society for Testing and Materials) standard guide to assess the compatibility of metal-heat transfer liquid pairs in solar heating and cooling systems
[PB80-161748] N80-27826
MHD channel flow and heat transfer in a time-dependent spatially varying magnetic field N80-28183
Heat transport due to the collisionless tearing instabilities
[IPPJ-461] N80-28197
HEAT TRANSFER COEFFICIENTS
Survey on prediction procedures for the calculation of furnace performance --- heat transfer models N80-27387
Heat and mass transfer from a rotating disk with phase change N80-27625
SSV Generic OFT first stage ascent base convective heating environments
[NASA-CR-161499] N80-27630
Addendum to SSV generic OFT first stage ascent base convective heating environments
[NASA-CR-161497] N80-27631
HEAT TRANSMISSION
Crustal stress and heat flow measurement in northern Anatolia N80-27883
A nonlinear Volterra equation in variable domain --- nonlinear heat flow equation
[AD-A083829] N80-28107
HEAT TREATMENT
A new theory of turbulent convection over a heated surface N80-27623
HEATING
Analytical models for the compressive heating ignition of high explosives
[AD-A083889] N80-27460
HEATING EQUIPMENT
Solar energy system performance evaluation-seasonal report for Elcam San Diego, San Diego, California
[NASA-CR-161481] N80-27806
HEAVY IONS
Comparative study of energy accounting for heavy ion fusion with various driver accelerators
[IPPJ-454] N80-28195
HEAVY LIFT LAUNCH VEHICLES
Solar power satellite system definition study. Volume 5: Space transportation analysis, phase 3
[NASA-CR-160746] N80-27813
HELICOPTERS
Helicopter air traffic management systems with civil/military interoperability N80-27326
Study of cost/benefit tradeoffs available in helicopter noise technology applications
[AD-A083955] N80-27354
Air to air helicopter fire control equations and software generation
[AD-A084115] N80-27359
System description and analysis. Part 1: Feasibility study for helicopter/VTOL wide-angle simulation image generation display system
[NASA-CR-152376] N80-27397
Vertebral pain in helicopter pilots
[NASA-TM-75792] N80-28043
Assessment of the environmental compatibility of differing helicopter noise certification standards
[AD-A080525] N80-28153
HELMETS
A mathematical model for use in evaluating and developing impact test methods for protective headgear
[PB80-164957] N80-28055
HEMODYNAMIC RESPONSES
Results of studies of pulsed blood flow and regional vascular tonus during flights in the first and second expeditions aboard the Salyut-6-Soyuz orbital complex --- effects of weightlessness N80-27996
Circulation in exercising crew members of the first main expedition aboard Salyut-6 N80-27997
Hemodynamics and phase structure of the cardiac cycle in members of the first crew of Salyut-5 at rest --- effects of hypokinesia and weightlessness N80-27998
Studies of prognostic significance of antiorthostatic position N80-28006
Regional redistribution of rat blood after 7 and 30 days of hypokinesia N80-28009
Pharmacological analysis of physiological mechanisms of orthostatic hemodynamic stability N80-28026
HEMODYNAMICS
Method for assessing hemodynamics and detecting latent insufficiency of cerebral circulation in cosmonaut candidates N80-28012
HETERODYNING
An experiment concept to measure stratospheric trace constituents by laser heterodyne spectroscopy N80-27869
A 346 GHz heterodyne receiver and its use in observations of carbon monoxide in interstellar clouds N80-28268
HETEROJUNCTION DEVICES
Heterojunction solar cells
[SERI/TP-32-134] N80-27822
HIGH ALTITUDE
Effect of conditioning for hypoxia on fertility of white mice N80-28030
HIGH ALTITUDE BALLOONS
Gas replenishment techniques for use in high-altitude, long-duration scientific balloon flights
[AD-A084486] N80-27297
HIGH FREQUENCIES
Potential use of high frequency data transmission for oceanic air traffic control improvement
[AD-A075810] N80-27313

High power HF and noise cancellation system
[AD-A084016] N80-27562
Theoretical feasibility of digital communication over ocean areas by high frequency radio
[AD-A079424] N80-27568
HF (High-Frequency) radio noise in the topside ionosphere
[PB80-162870] N80-27591
The NOAA SEL HF radar system (ionospheric sounder)
[PB80-160989] N80-27905

HIGH PRESSURE
Surveys of high-pressure effects in solids
[AD-A083728] N80-27722
Ultrasonic method of recording gas bubbles in animal venous blood in a rarefied atmosphere N80-28013
Respiration and gas exchange under hyperbaric conditions N80-28016
Phase equilibrium of light gases and heavy hydrocarbons at elevated temperatures and pressures N80-28225

HIGH RESOLUTION
The High Visible Resolution (HVR) instrument of the spot ground observation satellite
[NASA-TM-75830] N80-27781
High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements
[NASA-CP-2134] N80-27866

HIGH STRENGTH ALLOYS
The microstructural behavior of austenite due to hot rolling N80-27471
The effect of microstructure on the properties of high strength aluminum alloys
[AD-A083768] N80-27474
Plastic deformation and ductile fracture at an angle slit in a sheet under tension
[AD-A084564] N80-27728
Mechanical properties data center
[AD-A083123] N80-28237

HIGH TEMPERATURE
High-temperature radial turbine demonstration
[AD-A084120] N80-27370
Effect of high ambient temperature on human performance N80-28023

HIGH TEMPERATURE FLUIDS
Phase equilibrium of light gases and heavy hydrocarbons at elevated temperatures and pressures N80-28225

HIGH TEMPERATURE GASES
A computer program for thermal radiation from gaseous rocket exhaust plumes (GASRAD)
[NASA-CR-161496] N80-27423

HIGH TEMPERATURE RESEARCH
Feasibility of Kevlar 49/PMR-15 polyimide for high temperature applications
[NASA-TM-81560] N80-27429

HIGH VOLTAGES
Model for the ready definition and approximate comparison of alternative high voltage transmission systems
[DOE/ET-5916-1] N80-27611

HIGHWAYS
Frictional resistance of pavements
[PB80-162662] N80-27537
Aerial surveys, geometrics, surface drainage, ecological impacts and safety appurtenances
[PB80-162233] N80-28257

HOLES (ELECTRON DEFICIENCIES)
Interactions in solids N80-28218

HOLOGRAMMETRY
Holographic flow visualization. Citations from the NTIS data base
[PB80-808199] N80-27681

HOLOGRAPHY
Holographic flow visualization. Citations from the NTIS data base
[PB80-808199] N80-27681
Holographic flow visualization. Citations from the Engineering Index data base
[PB80-808207] N80-27682

HORMONE METABOLISMS
The content of catecholamines in the adrenal glands and sections of the brain under hypokinesia and injection of some neurotropic agents
[NASA-TM-76010] N80-28044

HOT STARS
HI shells in the galaxy N80-28267

HOT-WIRE FLOWMETERS
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
An experimental study of the coherent motions in an axisymmetric mixing layer N80-27620

HUBBLE DIAGRAM
A neutral hydrogen survey of blue compact galaxies N80-28278

HUMAN FACTORS ENGINEERING
System, airspace, and capacity requirements for future ATC-systems N80-27328
Some aspects of application of the systemic approach to aviation engineering psychology N80-28002
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-165269] N80-28262
Identification of superior energy-absorbing materials for school bus interiors. Volume 2: Technical report
[PB80-165277] N80-28263

HUMAN PERFORMANCE
Effect of high ambient temperature on human performance N80-28023
A concept for developing human performance specifications
[AD-A084617] N80-28054

HUMAN TOLERANCES
Construction and application of a questionnaire for the social scientific investigation of environmental noise effects
[NASA-TM-75492] N80-27835

HURRICANES
Numerical simulation of hurricanes using radar and satellite-derived rainfall N80-27910
National Hurricane and Experimental Meteorology Laboratory, fiscal year 1979
[PB80-165228] N80-27965

HYBRID COMPUTERS
Hybrid image processing system
[AD-A084563] N80-28070

HYDRATES
Investigation of heat storages with salt hydrate as storage medium based on the extra water principle
[EUR-6646-PT-2] N80-27818

HYDRAULIC EQUIPMENT
Cavitation damage mechanisms: Review of literature
[AD-A083805] N80-27638
Fluoroalkyleneether silicate/viton GLT blends for hydraulic system seals: Synthesis, blending, and testing
[AD-A084708] N80-27701

HYDRAULIC FLUIDS
Fire-resistant hydraulic fluid safety
[PB80-159486] N80-27544

HYDRAZINES
Fundamental studies of the structure and chemistry of solid surfaces --- hydrazine decomposition
[AD-A083964] N80-27475

HYDRIDES
HYCSOS: Hydride conversion and storage system sensitivity analysis
[ANL/EES-TM-63] N80-27523

HYDROCARBON FUEL PRODUCTION
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Overview of R&D status on COM technology in Japan N80-27495
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497
Hydrolyzed wood slurry flow modeling --- hydrocarbon fuel production
[LBL-10090] N80-27703

HYDROCARBON FUELS
Fundamental characterization of alternative fuel effects in continuous combustion systems N80-27382
Chemical kinetic modelling for combustion application N80-27383
The fate and behavior of fuel-sulfur in combustion systems N80-27422

HYDROCARBONS
Performance, emissions, and physical characteristics of a rotating combustion aircraft engine, supplement A
[NASA-CR-135119] N80-27361
The biosynthesis of natural rubber and other hydrocarbon polymers N80-27482
Phase equilibrium of light gases and heavy hydrocarbons at elevated temperatures and pressures N80-28225

HYDRODYNAMICS
Numerical simulation of the global circulation of the atmosphere --- hydrodynamics N80-27927

HYDROELECTRIC POWER STATIONS
Undeveloped hydropower as a potential energy source in Idaho
[PB80-157399] N80-27824

HYDROGEN
Visible laser research one meter device
[AD-A084196] N80-27688
Hydrogen compatibility of structural materials for energy storage and transmission
[SAND-80-8202] N80-27820
Airborne infrared spectroscopy of ionized hydrogen regions and the galactic center N80-28266

HYDROGEN ATOMS
Tables of transition probabilities and branching ratios for electric dipole transmissions between arbitrary levels of hydrogen-like atoms
[NASA-TM-80682] N80-28167

HYDROGEN FUELS
The fate and behavior of fuel-sulfur in combustion systems N80-27422

HYDROGEN PRODUCTION
Hydrogen production using solid-polymer-electrolyte technology for water electrolysis and hybrid sulfur cycle
[EPRI-EM-1185] N80-27518

HYDROGEN-BASED ENERGY
Hydrogen technology: Foreign, change 1
[AD-A083865] N80-27816

HYDROGENATION
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-58] N80-27515
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-55] N80-27516
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-50] N80-27517
Catalytic liquefaction of biomass
[LBL-10091] N80-27520
Coal gasification technology. Citations from the NTIS data base
[PB80-808090] N80-27525

HYDROGEOLOGY
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
Dewatering systems for surface coal mines
[PB80-160153] N80-27789

HYDROLOGY
On Climatology, Hydrology, Atmospheric Research and Meteorology (CHARM) from Space --- conference proceedings, Ajaccio, France, 12-16 Nov. 1979
[ESA-SP-150] N80-27733
Research on the hydrology and water quality of watersheds subjected to surface mining. Phase 1: Premining hydrologic and water quality conditions --- Ohio
[PB80-159510] N80-27784
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona --- Picacho Basin
[PB80-159908] N80-27788

HYDROLOGY MODELS
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787
First generation numerical ocean prediction models: Goal for the 1980's
[AD-A083855] N80-27976

HYDROXYL RADICALS
Laser induced fluorescence spectroscopy of OH in flames N80-27683

HYPERCAPNIA
Dynamics of human external respiration and blood gases under the combined effect of hypercapnia and hypoxia N80-28024
HYPERGEOMETRIC FUNCTIONS
Transient acoustic wave propagation in an Epstein duct
[AD-A083484] N80-28160
HYPERTENSION
Mechanism of selective lesion of the cardiovascular system in psycho-emotional stress
[NASA-TM-76035] N80-28045
HYPODYNAMIA
Effect of psychotropic drugs on gastric ulcers induced by immobilization: Increased protective effect of amitriptyline caused by chlordiazepoxide
[NASA-TM-76197] N80-27991
Effects of hypodynamia on the hemocoagulative properties of the vascular wall and myocardium
[NASA-TM-76199] N80-27992
Pharmacological analysis of physiological mechanisms of orthostatic hemodynamic stability N80-28026
Morphofunctional correlations in the experimental study of myocardiopathies under the stress of forced restraint. Note 2: The influence of adrenal imbalance
[NASA-TM-76138] N80-28040
Mechanism of selective lesion of the cardiovascular system in psycho-emotional stress
[NASA-TM-76035] N80-28045
HYPOKINESIA
Oxygen consumption of animals under conditions of hypokinesia
[NASA-TM-76167] N80-27983
Mechanisms of water-salt metabolism disturbances in dogs subjected to six month hypokinesia
[NASA-TM-76170] N80-27984
Calorigenic effect of adrenaline in rats under conditions of restricted motor activity
[NASA-TM-76192] N80-27988
Displacement of plasma protein and conduction velocity in rats under action of acceleration forces and hypokinesia
[NASA-TM-76195] N80-27989
Effects of immobilization on spermiogenesis
[NASA-TM-76282] N80-27993
Biochemical bases of pathogenesis of hypokinesia N80-27995
Circulation in exercising crew members of the first main expedition aboard Salyut-6 N80-27997
Hemodynamics and phase structure of the cardiac cycle in members of the first crew of Salyut-5 at rest --- effects of hypokinesia and weightlessness N80-27998
Evaluation of efficacy of the set of preventive measures referable to the human neuromuscular system under hypokinetic conditions N80-28007
The stress reaction to hypokinesia and its effect on general resistance N80-28008
Regional redistribution of rat blood after 7 and 30 days of hypokinesia N80-28009
Secretion, incretion and resecretion of pancreatic lipase during prolonged restriction of motor activity N80-28010
Isolation and gas chromatographic demonstration of volatile organic substances in thin-layer biological samples N80-28014
Role of dynamic space flight factors in the pathogenesis of involution of lymphatic organs (experimental morphological study) N80-28022
Bioelectric activity of the human brain during and after 182-day anitorthosatic hypokinesia N80-28027
Morphometric analysis of glomerules and juxtaglomerula system of the rat kidney in the course of experimental hypokinesia N80-28028
Effect of hypokinesia on changes in carbohydrate and lipid metabolism in the heart and liver N80-28029
Effect of hypokinesia on invertase activity of the mucosa of the small intestine
[NASA-TM-76191] N80-28039
Changes of the body functions during long-term hypokinesia
[NASA-TM-76166] N80-28041
The content of catecholamines in the adrenal glands and sections of the brain under hypokinesia and injection of some neurotropic agents
[NASA-TM-76010] N80-28044
Cardiovascular and respiratory physiopathological aspects of hypokinesia
[NASA-TM-76198] N80-28048
HYPOXIA
Dynamics of human external respiration and blood gases under the combined effect of hypercapnia and hypoxia N80-28024
Effect of conditioning for hypoxia on fertility of white mice N80-28030
Altitude hypoxia. Citations from the NTIS data base
[PB80-807696] N80-28052
HYSTERESIS
Hysteric behavior of reinforced concrete structural walls
[PB80-165905] N80-27533

I

ICE ENVIRONMENTS
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794
ICE FORMATION
Ice sheets, glaciers, and climate N80-27742
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757
ICE NUCLEI
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964
IGNITION
Ignition, combustion, detonation, and quenching of reactive mixtures
[AD-A083737] N80-27456
Evolution of deflagration in a cold combustible subjected to a uniform energy flux
[AD-A083822] N80-27461
IGNITION SYSTEMS
Analytical models for the compressive heating ignition of high explosives
[AD-A083889] N80-27460
IMAGE PROCESSING
Digital image analysis of two phase flow data
[AD-A084187] N80-27546
Meteorological research --- optimization of processing techniques applied to satellite sounding data N80-27738
Statistical investigation of the propagation of random and non-random errors in block aerotriangulation systems N80-27763
On the accuracy of pixel relaxation labeling
[E80-10165] N80-27765
PDP 11/45 LACIE phase 11/111 automatic status and tracking system functional design specification
[E80-10222] N80-27772
A note on the generation of Poisson-distributed random numbers with large mean
[E80-10224] N80-27773
Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 1-12)
[E80-10226] N80-27775
Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 13-23)
[E80-10227] N80-27776
Region representation: Quadtree-to-raster conversion
[AD-A084288] N80-28112
Computing the Euler number of image from its quadtree
[AD-A084289] N80-28113
A distance transform for images represented by quadtrees
[AD-A084290] N80-28114
Fitting mosaic models to textures
[AD-A084291] N80-28115
Shape segmentation using relaxation, 2
[AD-A084292] N80-28116
Region representation: Quadtrees from binary arrays
[AD-A084287] N80-28117
Image Coding: Report of a Workshop
[PB80-164817] N80-28240
IMAGE RESOLUTION
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
IMAGING TECHNIQUES
System description and analysis. Part 1: Feasibility study for helicopter/VTOL wide-angle simulation image generation display system
[NASA-CR-152376] N80-27397
Enhanced UK teletext moves towards still pictures
[BBC-RD-1980/4] N80-27545
A 16 level color display system for two dimensional ultrasonic data
[AD-A083854] N80-27678
Hybrid image processing system
[AD-A084563] N80-28070
Image Coding: Report of a Workshop
[PB80-164817] N80-28240
On the periodicities of Saturn's reflectivity in the visible N80-28282
IMMOBILIZATION
Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981
Effect of central neurotropic substances on the hypophysisadrenal cortex system during immobilization of animals
[NASA-TM-76158] N80-27982
Effect of immobilization on the EEG of the baboon. Comparison with telemetry results from unrestricted animals
[NASA-TM-76137] N80-27987
Experimental coronary sclerosis induced by immobilization of rabbits: A new model of arteriosclerosis
[NASA-TM-76196] N80-27990
Effects of immobilization on spermiogenesis
[NASA-TM-76282] N80-27993
IMPACT LOADS
Flightworthy active control landing gear for a supersonic aircraft
[NASA-CR-3298] N80-27350
IMPACT RESISTANCE
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-165269] N80-28262
IMPACT TESTS
Liquid impact erosion mechanisms in transparent materials
[AD-A084267] N80-27491
A mathematical model for use in evaluating and developing impact test methods for protective headgear
[PB80-164957] N80-28055
Identification of superior energy-absorbing materials for school bus interiors. Volume 2: Technical report
[PB80-165277] N80-28263
IMPEDANCE MATCHING
Radiation by sources on perfectly conducting convex cylinders with an impedance surface patch
[AD-A084345] N80-27573
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs --- antenna design N80-27597
IMPINGEMENT
Heat and mass transfer from a rotating disk with phase change N80-27625
IMPLOSIONS
Catoptrical X-ray optical system for use in laser-fusion diagnostics
[AD-A084688] N80-28201
HI shells in the galaxy N80-28267
IMPURITIES
Amorphous thin films for solar cell application
[DOE/ET-23040-3] N80-27819
INCOMPRESSIBLE FLOW
Turbulent Boundary Layers: Experiments, Theory and Modeling --- conference
[AGARD-CP-271] N80-27647
A discussion of probe effects and improved measuring techniques in the near-wall region of an incompressible three-dimensional turbulent boundary layer N80-27657
A turbulence closure of the transport equation for the probability density of velocity N80-27662
INDEPENDENT VARIABLES
Structural parameter identification of member characteristics in a finite element model N80-28095

INDEXES (DOCUMENTATION)
Geomagnetic observations 1978 --- station locations, instruments, and data management
[PB80-146087] N80-27907
INDIAN OCEAN
Profiles of velocity and temperature near the Indian Ocean Equator, revision
[AD-A083779] N80-27975
INDIUM ANTIMONIDES
Preparation and chracterization of infrared materials
[AD-A084324] N80-28223
INDUSTRIAL ENERGY
Solar process heat. Citations from the NTIS data base

INDUSTRIAL PLANTS
Criteria for a recommended standard: Occupational exposures in coal gasification plants
[PB80-164874] N80-27535
Control of Particulate Emissions in the Primary Nonferrous Metals Industries --- conference
[PB80-151822] N80-27847
A review of standards of performance for new stationary sources: Secondary lead smelters
[PB80-154065] N80-27851
INDUSTRIAL SAFETY
Recommended health and safety guidelines for coal gasification pilot plants
[PB80-164890] N80-27536
Control of physical agent hazards of arc welding and cutting
[PB80-164866] N80-27705
INDUSTRIAL WASTES
Characterization of pri ity pollutants from an airplane parts manufacturir facility
[PB80-151566] N80-27848
INELASTIC COLLISIONS
Inelastic collisions of excited atoms
[AD-A084524] N80-28172
INEQUALITIES
Convergent approximations in parabolic variationally inequalities. 1: One phase Stefan problems
[AD-A083814] N80-28105
INERTIAL NAVIGATION
Characteristic for a moderate accuracy Inertial Navigation System (INS)
[AD-A084036] N80-27318
Accuracy of aircraft velocities from inertial navigation systems for application to airborne wind measurements
[NASA-TM-81826] N80-27913
INERTIAL PLATFORMS
Retrieval techniques: LVLH and inertially stabilized payloads
[NASA-TM-81099] N80-27416
INERTIAL UPPER STAGE
Shuttle program. STS-7 conceptual flight profile. IUS/TDRS-A
[NASA-TM-81090] N80-27405
INFESTATION
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
INFORMATION DISSEMINATION
A regional technology transfer program --- North Carolina Industrial Applications Center for the Southeast
[NASA-CR-163360] N80-28253
INFORMATION MANAGEMENT
Applying behavioral abstraction to information system design and integrity N80-28231
User need in documentation and information. Citations from the NTIS data base
[PB80-807910] N80-28239
Report of the Advisory Committee on Information Network Strucuture and Functions for the Executive Office of the President
[PB80-165673] N80-28241
INFORMATION RETRIEVAL
The optimization of query processing on distributed database systems N80-28087
Access path optimization in multidimensionally accessed database files N80-28234
INFORMATION SYSTEMS
Enhanced Terminal Information Services (ETIS) utilizing the Discrete Address Beacon System (DABS) data link-concept description
[AD-A073205] N80-27319
Thermophysical and Electronic Properties Information Analysis Center (TEPIAC). A continuing systematic program on data tables of thermophysical and electronic properties of materials

Report of the Advisory Committee on Information Network Strucuture and Functions for the Executive Office of the President
[PB80-165673] N80-28241
INFORMATION THEORY
Procedural attachment
[AD-A084637] N80-28092
INFRARED ABSORPTION
Determination of the optical constants of highly absorbing materials in the infrared region
[AD-A083883] N80-28181
INFRARED ASTRONOMY
Infrared studies of AFGL sources --- Air Force Geophysical Laboratory infrared catalog
[AD-A084713] N80-28274
INFRARED IMAGERY
Mountain overflow phenomena in satellite imagery N80-27754
A cylindrical cloud model for microwave and infrared radiative transfer-applications to defense meteorological satellite program microwave sounders N80-27912
INFRARED INSTRUMENTS
Preparation and chracterization of infrared materials
[AD-A084324] N80-28223
INFRARED RADIOMETERS
Approach to sounding on the VAS processor
[NASA-TM-80713] N80-28056
INFRARED SPECTROMETERS
Infrared fine-structure line emission from the galactic center N80-28269
INFRARED SPECTROSCOPY
Infrared study of hydrogen chemisorbed on W(100) by surface electrommagnetic wave spectroscopy N80-27554
High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements
[NASA-CP-2134] N80-27866
Executive summary of the Workshop on High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements N80-27867
Airborne infrared spectroscopy of ionized hydrogen regions and the galactic center N80-28266
INFRARED TELESCOPES
Activities of the Kloppenheim satellite observation station
[SER-B-230] N80-28292
Determination of astronomical coordinates at the Kloppenheim satellite observation station using the circumzenithal astrolabe VUGTK; for the period 1972 to 1975 N80-28294
INFRASONIC FREQUENCIES
The effects of high level infrasound
[AD-A081792] N80-28159
INLET FLOW
Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery noise
[AD-A084355] N80-27369
INSECTS
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
INSOLATION
ASHMET: A computer code for estimating insolation incident on tilted surfaces
[NASA-TM-78286] N80-27807
INSTALLING
Technical and operational factors concerning the licensing and introduction of a new microwave landing system for category 2 N80-27336
INSTRUMENT APPROACH
Helicopter air traffic management systems with civil/military interoperability N80-27326
INSTRUMENT FLIGHT RULES
US Army users outlook on air traffic management N80-27333
INSTRUMENT LANDING SYSTEMS
In-service improvements to reliability and maintainability of the instrument landing system
[AD-A075556] N80-27312
SSILS initial evaluation report. Davis-Monthan AFB, Arizona, 16-20 November 1979
[AD-A084635] N80-27320
Technical and operational factors concerning the licensing and introduction of a new microwave landing system for category 2 N80-27336
Evolution and transition of today's military landing system to compatibility with present and future civil military systems --- multimode receivers and the marine remote area approach landing system N80-27339
INSULATION
Optical properties and solar selectivity of metal-insulator composite films N80-28177
INTEGRAL EQUATIONS
Combustion zone modeling in unsteady regime N80-27385
The boundary integral equation method applied to free surface flow problems in porous media N80-27762
INTEGRATED CIRCUITS
IC Ku-Band impatt amplifier --- solid state spacecraft transmitter
[NASA-CR-160004] N80-27601
Printed circuits. Citations from the Engineering Index data base
[PB80-807571] N80-27614
Printed circuits. Citations from the NTIS data base
[PB80-807563] N80-27615
INTEGRATED ENERGY SYSTEMS
Solar heating system installed at Stamford, Connecticut
[NASA-CR-161436] N80-27800
Solar energy system performance evaluation: Seasonal report for Contemporary-Manchester, Manchester, New Hampshire
[NASA-CR-161471] N80-27802
INTERFACE STABILITY
Dynamic analysis of noncontacting face seals
[NASA-TM-79294] N80-27695
INTERFACIAL TENSION
Finite difference solution of the nonlinear Cosserat jet equations for a viscous fluid with surface tension N80-27626
INTERMETALLICS
Iron-based alloys strengthened by ternary Laves phases --- precipitation hardening
[PB80-157233] N80-27480
INTERNAL WAVES
Propagation and generation of internal tides on the continental margin N80-27973
INTERNATIONAL COOPERATION
A first European joint effort in earthquake prediction research N80-27884
INTERNATIONAL SUN EARTH EXPLORERS
Results of an ISEE-1 experiment to study the interactions between energetic particles and discrete VLF waves in the magnetosphere
[NASA-CR-160006] N80-27421
INTERPOLATION
Application of best linear unbiased prediction to interpolation of random fields and to network design
[AD-A083656] N80-28144
INTERSTELLAR CHEMISTRY
A 346 GHz heterodyne receiver and its use in observations of carbon monoxide in interstellar clouds N80-28268
INTESTINES
Effect of hypokinesia on invertase activity of the mucosa of the small intestine
[NASA-TM-76191] N80-28039
INTRAVASCULAR SYSTEM
Ultrasonic method of recording gas bubbles in animal venous blood in a rarefied atmosphere N80-28013
INVERSIONS
Multicolor inversion diagnostic for tactital motor plumes
[AD-A083904] N80-27426
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27859

INVESTIGATION
Morphofunctional correlations in the experimental study of myocardiopathies under the stress of forced restraint. Note 2: The influence of adrenal imbalance
[NASA-TM-76136] N80-28040
Mechanism of selective lesion of the cardiovascular system in psycho-emotional stress
[NASA-TM-76035] N80-28045
INVISCID FLOW
An alternative approach to the numerical simulation
[NASA-TM-81542] N80-27286
ION ACOUSTIC WAVES
Interaction of ion-acoustic solitons in two-dimensional space
[IPPJ-459] N80-28198
ION BEAMS
Axial and radial compression of ion beams
[AD-A083702] N80-28171
ION CONCENTRATION
An investigation of the empirical calibration method in quantitative secondary ion N80-27449
ION IMPLANTATION
Quantitative secondary ion mass spectrometric analysis using ion implanation N80-27450
The effect of ion plating and ion implantation on the cyclic response and fatigue crack initiation of metals and alloys
[AD-A083643] N80-27478
Noncoplanar high power FET
[AD-A083682] N80-27907
ION PROPULSION
Inert gas ion thruster development
[NASA-CR-159805] N80-27424
ION SOURCES
A study of the general plasma characteristics of a high power, multifilament ion source N80-28187
IONIZATION
Low energy ion molecule reactions in chemical ionization by mass-analyzed ion kinetic energy spectrometry N80-27448
Studies in the ionization of atoms and ions by photons N80-28162
IONIZATION CROSS SECTIONS
Studies in the ionization of atoms and ions by photons N80-28162
IONOSPHERIC DISTURBANCES
A discussion of artic ionograms
[AD-A083550] N80-27898
Nonlinear equatorial spread F: Spatially large bubbles resulting from large horizontal scale initial perturbations
[AD-A083390] N80-27903
IONOSPHERIC DRIFT
Numerical simulation and theory of strong ionospheric gradient-drift turbulence N80-27864
IONOSPHERIC ELECTRON DENSITY
A method for direct determination of real height from virtual height data for the auroral region of the ionosphere
[AD-A083139] N80-27899
Effects of impulsive heating events on F-region chemistry and electron density
[AD-A083330] N80-27902
IONOSPHERIC HEATING
Effects of impulsive heating events on F-region chemistry and electron density
[AD-A083330] N80-27902
IONOSPHERIC PROPAGATION
Development of a small rocket system for conductivity measurements in the high latitude disturbed D-region in support of ELF/VLF propagation studies
[AD-A083331] N80-27897
ULF/LF reflectivity of the polar ionosphere
[AD-A083240] N80-27901
IONOSPHERIC SOUNDING
Rocket borne composition measurements of the lower thermosphere with a new type of instrumentation: Auroral secondary electron energy spectra measured with a new form of cylindrical analyzer N80-27865
The NOAA SEL HF radar system (ionospheric sounder)
[PB80-160969] N80-27905
IONOSPHERIC STORMS
Computer simulation of a magnetospheric substorm N80-27862
IRON
The magnetic properties of amorphous (Fe-Ni-Co): Metalloid alloys N80-27472
IRON ALLOYS
The critical points of alloys of iron and cobalt during rapid heating
[NASA-TM-75825] N80-27473
IRRADIANCE
The solar constant and its spectrum — relationship to Earth's climate N80-27745
ISCHEMIA
Mechanism of selective lesion of the cardiovascular system in psycho-emotional stress
[NASA-TM-76035] N80-28045
ITALY
A study for development of methods for air traffic management N80-27327

J

JAPAN
Overview of R&D status on COM technology in Japan N80-27485
JET ENGINE FUELS
The 1H and 13C Fourier transform NMR characterization of jet fuels derived from alternated energy sources
[AD-A084169] N80-27513
Turbine flowmeters and their applications at the Naval Air Propulsion Center
[AD-A084181] N80-27880
JET FLOW
Turbulent reaction and transport phenomena in jet flames N80-27376
JET MIXING FLOW
An experimental investigation of reactive, turbulent, recirculating jet mixing
[AD-A084546] N80-27842
JOINTS (JUNCTIONS)
Development of a rebar dowel anchorage system for attaching the California type 25 concrete barrier to existing bridges
[PB80-161722] N80-27534
JOSEPHSON JUNCTIONS
Tunable far-infrared radiation generated by a Josephson junction N80-28207
JUPITER (PLANET)
Synoptic observations of Jupiter's radio emissions: Average Statistical properties observed by Voyager
[NASA-TM-80717] N80-28295

K

KALMAN FILTERS
Comparison of an alpha-beta and kalman filter in track while scan radars
[AD-A084464] N80-27578
KEVLAR (TRADEMARK)
Feasibility of Kevlar 49/PMR-15 polyimide for high temperature applications
[NASA-TM-81560] N80-27429
KIDNEYS
Effect of weightlessness and artificial gravity on ion-regulating function of rat kidneys N80-27899
Morphometric analysis of glomerulus and juxtaglomerula system of the rat kidney in the course of experimental hypokinesia N80-28028
KINETIC ENERGY
An attitude acquisition technique for dual-spin spacecraft — spacecraft rotor alignment N80-27417
Low energy ion molecule reactions in chemical ionization by mass-analyzed ion kinetic energy spectrometry N80-27448
The kinetic energy climatology of tropospheric and lower stratospheric flow regimes associated with 500 MB intermediate and short waves over North America N80-27883
KINETICS
Computer calculation of mechanisms involving intermittent motions
[AD-A083809] N80-28088
KNOWLEDGE
Procedural attachment
[AD-A084637] N80-28092

L

LAKE ERIE
Coordinated aircraft and ship surveys for determining impact of river inputs on great lakes waters. Remote sensing results
[NASA-TP-1694] N80-27932
LAKE MICHIGAN
Coordinated aircraft and ship surveys for determining impact of river inputs on great lakes waters. Remote sensing results
[NASA-TP-1694] N80-27932
LAKE ONTARIO
Coordinated aircraft and ship surveys for determining impact of river inputs on great lakes waters. Remote sensing results
[NASA-TP-1694] N80-27932
LAKE SUPERIOR
Coordinated aircraft and ship surveys for determining impact of river inputs on great lakes waters. Remote sensing results
[NASA-TP-1694] N80-27932
LAKES
The development of PALIS: A Ponds and Lakes Information System for Massachusetts
[PB80-156976] N80-27786
LAMINAR BOUNDARY LAYER
Numerical solutions for laminar boundary layer behind blast waves
[AD-A084436] N80-27844
LAMINAR FLOW
Mathematical Theory of Laminar Combustion. Chapter 5: Unsteady burning of a linear condensate
[AD-A083736] N80-27458
Calculation of the laminar viscosity of a gaseous mixture for gas dynamic mixing comparisons for a reacting shear layer
[AD-A083970] N80-27540
Turbulent diffusion from a point source in stratified and neutral flows around a three dimensional hill. Part 1: Diffusion equation analysis
[PB80-163059] N80-27967
LAMINATES
Feasibility of Kevlar 49/PMR-15 polyimide for high temperature applications
[NASA-TM-81560] N80-27429
Electron energy dissipation in layered media N80-27600
Ultrasonically activated diffusion bonding for fluidic control assembly
[AD-A084659] N80-27702
LAND ICE
Ice sheets, glaciers, and climate N80-27742
LAND MANAGEMENT
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793
Application of geomorphic principles to environmental management in semiarid regions
[PB80-169303] N80-27908
LAND USE
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
Land use and environmental impacts of decentralized solar energy use
[DOE/EV-0067] N80-27943
LANDING AIDS
West Coast LORAN-C flight test
[AD-A084039] N80-27307
The development and test of a tactical self-contained landing system — landing military helicopters when the safe corridor is unknown N80-27334
SINTAC-C TMA: Application of SINTAC-C in the terminal area, during landing and ground taxiing — integrated navigation, traffic control, collision avoidance and communication system N80-27338
LANDING GEAR
Flightworthy active control landing gear for a supersonic aircraft
[NASA-CR-3296] N80-27350
LANGUAGE PROGRAMMING
Program documentation for the gas chromatography automation system N80-27464
LARGE AREA CROP INVENTORY EXPERIMENT
Final design specification for LARSYS/ISOCLS modification for LACIE phase 3
[E80-10212] N80-27769

Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10219] N80-27770
Transfer of Interactive Report Extracted Data (TIRED) requirements specification
[E80-10221] N80-27771
PDP 11/45 LACIE phase 11/111 automatic status and tracking system functional design specification
[E80-10222] N80-27772

LARGE SCALE INTEGRATION
Modeling and analysis of switched interconnection networks N80-27594

LASER ANEMOMETERS
Experimental study of coherent structures in the turbulent boundary layer of pipe flow using laser-Doppler anemometry N80-27680

LASER APPLICATIONS
Laser induced fluorescence spectroscopy of OH in flames N80-27983
Project group for laser research
[LA-TR-79-46] N80-27891
Remote measurements of air pollutants
[PB80-164791] N80-27852
Laser-produced plasmas and radiation sources
[AD-A084201] N80-28202

LASER CAVITIES
Computer program for the kinetics and populations in a xenon fluoride laser
[AD-A084459] N80-27990

LASER DOPPLER VELOCIMETERS
Flow field measurement using Raman and LDV techniques
[AD-A083767] N80-27835
Resonant Doppler velocimeter — flow visualization N80-27873

LASER FUSION
Optical performance analysis of CO2 laser fusion systems N80-27984
Catoptrical X-ray optical system for use in laser-fusion diagnostics
[AD-A084988] N80-28201

LASER PLASMA INTERACTIONS
Laser induced fluorescence of trapped molecular ions N80-28186
Laser-produced plasmas and radiation sources
[AD-A084201] N80-28202

LASER TARGETS
Laser-produced plasmas and radiation sources
[AD-A084201] N80-28202

LASERS
Airborne laser topographic mapping results from initial joint NASA/US Army Corps of Engineers experiment
[NASA-TM-73287] N80-27782
An experiment concept to measure stratospheric trace constituents by laser heterodyne spectroscopy N80-27989
Inelastic collisions of excited atoms
[AD-A084524] N80-28172

LATCHES
Release mechanism for releasing and reattaching experiments on the Space Shuttle
[NASA-TP-1702] N80-27694

LATE STARS
The distribution of G5-K5 stars in a region at the South Galactic Pole N80-28276

LATITUDE
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models — latitudinal variation N80-27956

LATTICE PARAMETERS
A Monte Carlo study of crystallization and crystalline order in simple two-dimensional systems N80-28208

LEADING EDGES
An improved panel method for the solution of three-dimensional leadingedge vortex flows. Volume 2: User's guide and programmer's document
[NASA-CR-3279] N80-27290
An improved panel method for the solution of three-dimensional leading-edge vortex flows. Volume 1: Theory document
[NASA-CR-3278] N80-27292

LEAKAGE
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700

LEAST SQUARES METHOD
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27959
New algorithms for nonlinear least squares and Bayesian parameter estimation
[AD-A083819] N80-28110

LICENSING
Technical and operational factors concerning the licensing and introduction of a new microwave landing system for category 2 N80-27336

LIFE (DURABILITY)
Analysis of life prediction methods for time-dependent fatigue crack initiation in nickel-base superalloys
[PB80-158116] N80-27481
An investigation of a statistical procedure for monitoring two-sample life tests
[AD-A084041] N80-27710

LIFE SUPPORT SYSTEMS
Study of compatibility of certain higher plants and chlorella as related to a bioregenerative human life support system N80-28033

LIFT
Numerical optimization of circulation control airfoils
[AD-A084129] N80-27293

LIGHT SCATTERING
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
Light scattering in a spherical planetary atmospheres, with applications to Venus N80-28284

LIGHTING EQUIPMENT
An investigation of laser lighting systems to assist aircraft landing
[AD-A077722] N80-27315

LIMB DARKENING
Photometric properties of carbonaceous chondrites and related materials N80-28283

LINE SPECTRA
A computer program for thermal radiation from gaseous rocket exhaust plumes (GASRAD)
[NASA-CR-161496] N80-27423
X-ray spectral constraints on the broad-line cloud geometry of NGC 4151
[NASA-TM-80726] N80-27915
Infrared fine-structure line emission from the galactic center N80-28269

LINEAR EQUATIONS
The primer vector in linear, relative-motion equations — spacecraft trajectory optimization
[NASA-TM-81111] N80-28096

LINEAR PROGRAMMING
Complexity and computability of solutions to linear programming systems
[AD-A084682] N80-28076
Optimal simplex tableau characterization of unique and bounded solutions of linear programs
[AD-A083816] N80-28109
Solution approaches for network flow problems with multiple criteria
[AD-A084283] N80-28146

LINEAR SYSTEMS
Control of nonlinear systems
[AD-A083963] N80-28089

LINKAGES
Force balancing machines and optimization of dynamic relations for planar mechanisms N80-27693

LIPID METABOLISM
Activity of some hepatic enzymes and lipogenetic processes in rat aipose tissue after space flight — effects of weightlessness N80-28000
Secretion, incretion and resecretion of pancreatic lipase during prolonged restriction of motor activity N80-28010
Effect of hypokinesia on changes in carbohydrate and lipid metabolism in the heart and liver N80-28029

LIQUEFACTION
Catalytic liquefaction of biomass
[LBL-10091] N80-27520

LIQUEFIED GASES
Gas replenishment techniques for use in high-altitude, long-duration scientific balloon flights
[AD-A094486] N80-27297

LIQUID FILLED SHELLS
Dynamics of a liquid-filled gyroscope: Up-date of theory and experiment
[AD-A083886] N80-27676

LIQUID HELIUM
A study of persistent current in superfluid 4He N80-27526
Pulsed NMR and zero sound measurements in superfluid helium-three N80-28204
The phase diagram and magnetization of super fluid 3HE N80-28208
Electrons on the surface of liquid helium N80-28212

LIQUID METALS
Experimental studies of excited metallic phases in stressed germanium N80-28205

LIQUID-VAPOR EQUILIBRIUM
Phase equilibrium of light gases and heavy hydrocarbons at elevated temperatures and pressures N80-28225

LIQUIDS
Measurements of the temperature dependent diamagnetism of liquids N80-28147

LITHOGRAPHY
Electron energy dissipation in layered media N80-27600

LITHOSPHERE
Geoid anomalies in the vicinity of subduction zones
[NASA-TM-80678] N80-27732

LIVER
Activity of some hepatic enzymes and lipogenetic processes in rat aipose tissue after space flight — effects of weightlessness N80-28000
Effect of hypokinesia on changes in carbohydrate and lipid metabolism in the heart and liver N80-28029

LOADS (FORCES)
Multilevel optimum design of wing box structures with fiber composite panel components N80-27349
The statistical strength of fibrous materials as influenced by fiber load-sharing and geometric configuration N80-27427
Stresses and deformations in elliptical contacts
[NASA-TM-81535] N80-27697

LOGIC DESIGN
Performance prediction from a computer hardware description
[AD-A083842] N80-28058
Formal techniques for fault-tolerance in Distributed Data Processing (DDP)
[AD-A084537] N80-28059

LOGISTICS MANAGEMENT
Helicopter air traffic management systems with civil/military interoperability N80-27326

LONG TERM EFFECTS
USSR Report: Space Biology and Aerospace Medicine, volume 14, no. 3, 1980
[JPRS-75956] N80-27994
System of hygienic inspection of nonmetal materials used in spacecraft equipment N80-28032

LOOP ANTENNAS
Theoretical and experimental study of the characteristics of a thin circular loop antenna above a homogeneous, dissipative half-space N80-27553

LORAN
Loran-C signal analysis
[AD-A084239] N80-27321

LORAN C
West Coast LORAN-C flight test
[AD-A084039] N80-27307
Loran-C signal analysis propagation model evaluation
[AD-A084338] N80-27583

LOW TEMPERATURE
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N48w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484

LUBRICATION
Fully flooded elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81543] N80-27698
Starved elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81549] N80-27699

LUMINOSITY
Radiation coupled dynamics of ram confined radio sources N80-27551
The HEAO A-2 survey of Abell clusters and the X-ray luminosity function
[NASA-TM-80680] N80-28290

LUMINOUS INTENSITY
The HEAO A-2 survey of Abell clusters and the X-ray luminosity function
[NASA-TM-80680] N80-28290

LUNAR EVOLUTION
Magma migration — applied to thermal evolution N80-27855
LUNAR GRAVITATIONAL EFFECTS
An analytical integration of the averaged equations of variation due to sun-moon perturbations and its application
[AD-A083231] N80-28281
LUNGS
Theoretical analysis of the effect of state of pulmonary circulation on distribution of ventilation-perfusion relations and gas exchange in the lungs N80-28011
Measurement of lung function using magnetometers. 1: Principles and mathematical modeling
[AD-A083910] N80-28038
LYMPH
Role of dynamic space flight factors in the pathogenesis of involution of lymphatic organs (experimental morphological study) N80-28022

M

M STARS
Observations of emission lines in M supergiants
[NASA-CR-163359] N80-28271
IUE observations of a luminous M supergiant that exhibits intense continuum in the far ultraviolet
[NASA-TM-80681] N80-28273
MAGMA
Magma migration — applied to thermal evolution N80-27855
MAGNETIC DIFFUSION
Steady state magnetic diffusion from resistive interchange modes
[AD-A083915] N80-28199
MAGNETIC FIELD CONFIGURATIONS
Current-carrying plasma in ferromak
[IPPJ-458] N80-28191
MAGNETIC FIELDS
Theory and design of electrical rotating machinery
[AD-A083499] N80-27604
MHD channel flow and heat transfer in a time-dependent spatially varying magnetic field N80-28183
The equilibrium and compression of ion rings N80-28185
Heat transport due to the collisionless tearing instabilities
[IPPJ-461] N80-28197
MAGNETIC MATERIALS
Materials research for advanced inertial instrumentation. Task 3: Rare earth magnetic material technology as related to gyro torquers and motors
[AD-A083968] N80-27679
MAGNETIC MONOPOLES
Interactions in solids N80-28218
MAGNETIC PROPERTIES
The magnetic properties of amorphous (Fe-Ni-Co): Metalloid alloys N80-27472
MAGNETIC SURVEYS
Magsat scientific investigations
[NASA-TM-80698] N80-27778
MAGNETIZATION
The phase diagram and magnetization of super fluid 3HE N80-28208
MAGNETOACOUSTICS
Determination of residual stress by magnetomechanical acoustic emission
[AD-A084065] N80-27479
MAGNETOHYDRODYNAMIC FLOW
MHD channel flow and heat transfer in a time-dependent spatially varying magnetic field N80-28183
MAGNETOHYDRODYNAMIC STABILITY
Experimental investigation of the anomalous skin effect and computer simulation of the collisionless interchange instability N80-28184
Instabilities of a magnetized plasma driven by a velocity ring or a density gradient N80-28186
Equilibrium and stability in strongly inhomogeneous plasmas — confinement schemes including field-reversed mirrors and tokamak sheaths N80-28188
MAGNETOHYDRODYNAMIC WAVES
Magnetospheric pulsations: Model and observations of standing Alfven wave resonances N80-27546
Coronal heating by stochastic magnetic pumping
[NASA-CR-163356] N80-28287
MAGNETOHYDRODYNAMICS
Engineering test facility design definition
[NASA-TM-81499] N80-27799
Axial and radial compression of ion beams
[AD-A083702] N80-28171
MAGNETOMETERS
Geomagnetic observations 1978 — station locations, instruments, and data management
[PB80-146087] N80-27907
Measurement of lung function using magnetometers. 1: Principles and mathematical modeling
[AD-A083910] N80-28038
MAGNETOSPHERE
Results of an ISEE-1 experiment to study the interactions between energetic particles and discrete VLF waves in the magnetosphere
[NASA-CR-160006] N80-27421
Magnetospheric pulsations: Model and observations of standing Alfven wave resonances N80-27546
Computer simulation of a magnetospheric substorm N80-27862
MAGSAT 1 SATELLITE
Magsat scientific investigations
[NASA-TM-80698] N80-27778
MAN MACHINE SYSTEMS
System, airspace, and capacity requirements for future ATC-systems N80-27328
Air traffic control automation: Its impact and use in the selection and screening of air traffic controllers N80-27329
Some aspects of application of the systemic approach to aviation engineering psychology N80-28002
BMG reference manual
[AD-A084454] N80-28074
MANAGEMENT INFORMATION SYSTEMS
The development of PALIS: A Ponds and Lakes Information System for Massachusetts
[PB80-156979] N80-27786
A systematic approach to the management of data on distributed data bases N80-28235
MANAGEMENT METHODS
A study for development of methods for air traffic management N80-27327
US Army users outlook on air traffic management N80-27333
MANAGEMENT PLANNING
Future US phosphorus loadings to the Great Lakes: An integration of water quality management planning information
[PB80-160336] N80-27791
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793
Transportation air quality analysis - sketch planning methods. Volume 2: Case studies
[PB80-158710] N80-27845
MANIFOLDS (MATHEMATICS)
Equilibria of the curvature functional and manifolds of nonlinear interpolating spline curves
[AD-A083807] N80-28106
MANNED SPACE FLIGHT
Results of the investigation of the otolith function in manned space flights
[NASA-TM-76103] N80-28046
MANUFACTURING
Manufacturing methods and technology measure for fabrication of silicon transcalent rectifier
[AD-A083122] N80-27605
MAPPING
The evaluation of a methodology to measure manual digitizing error in cartographic data bases N80-27761
Airborne laser topographic mapping results from initial joint NASA/US Army Corps of Engineers experiment
[NASA-TM-73287] N80-27782
Analytical plotters in Defense Mapping Agency
[AD-A083794] N80-27783
Contingent derivatives of set-valued maps and solutions to nonlinear inclusions and differential inclusions
[AD-A083826] N80-28108
MARINE ENVIRONMENTS
Large Antenna Multifrequency Microwave Radiometer (LAMMR) system design
[NASA-TM-80685] N80-27675
MARINE METEOROLOGY
Marine boundary layer sampling, flight no. 2
[AD-A083158] N80-27900
Response to subtropical marine boundary-layer cloudiness to large-scale forcing N80-27909
Preliminary investigations of the electrical response of water surfaces during marine thunderstorms N80-27911
MARINE RESOURCES
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 — ocean farming
[PB80-157662] N80-27795
MARKET RESEARCH
Community impediments to implementation of solar energy
[DOE/EV-0059] N80-27821
MARKETING
A regional technology transfer program — North Carolina Industrial Applications Center for the Southeast
[NASA-CR-163360] N80-28253
MARKOV PROCESSES
A prediction interval for a first order Gaussian Markov process
[AD-A084094] N80-28137
MASKING
An investigation of outlier definition and the impact of the masking phenomenon on several statistical outlier tests N80-28126
MASS FLOW
Turbine flowmeters and their applications at the Naval Air Propulsion Center
[AD-A084181] N80-27680
MASS SPECTROSCOPY
A multitechnique approach to surface studies of metals and alloys using X-ray photoelectron spectroscopy and secondary ion mass spectroscopy N80-27443
Low energy ion molecule reactions in chemical ionization by mass-analyzed ion kinetic energy spectrometry N80-27448
An investigation of the empirical calibration method in quantitative secondary ion N80-27449
Quantitative secondary ion mass spectrometric analysis using ion implanation N80-27450
MASS TRANSFER
Heat and mass transfer from a rotating disk with phase change N80-27625
The solution of boundary value problems in diffusive heat and mass transfer with convection: Functional analytic methods N80-27627
MASSACHUSETTS
The development of PALIS: A Ponds and Lakes Information System for Massachusetts
[PB80-156979] N80-27786
MATERIALS HANDLING
Preparation and chracterization of infrared materials
[AD-A084324] N80-28223
MATHEMATICAL MODELS
A numerical and experimental study of the turbulent wakes of turbomachinery rotor blades, isolated airfoils, and a cascade of airfoils N80-27277
Transonic small disturbances equation applied to the solution of two-dimensional nonsteady flows
[NASA-TM-75795] N80-27279
CAS2D: FORTRAN program for nonrotating blade-to-blade, steady, potential transonic cascade flows
[NASA-TP-1705] N80-27284
Determination of the safety in a North Atlantic organized track system with reduced lateral separation — statistical tests N80-27332
Combustor Modelling — conference
[AGARD-CP-275] N80-27371
Modeling the combustion chamber of a gas turbine: A mechanics viewpoint N80-27372
Fundamental modelling of mixing, evaporation and kinetics in gas turbine combustors N80-27373
Mathematical modelling of gas-turbine combustion chambers N80-27374
A prediction model for turbulent diffusion flames including NO-formation N80-27375
Turbulent reaction and transport phenomena in jet flames N80-27376
On the prediction of temperature profiles at the exit of annular combustors N80-27377
Second-order closure modeling of turbulent mixing and reacting flows N80-27378

Combustor modelling for scramjet engines N80-27379
Development and verification of radiation models N80-27380
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
Fundamental characterization of alternative fuel effects in continuous combustion systems N80-27382
Combustion zone modeling in unsteady regime N80-27385
Survey on prediction procedures for the calculation of furnace performance --- heat transfer models N80-27387
Modeling furnances fed with oxygen-enriched air N80-27389
An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390
Mathematical modeling of boiler operations N80-27391
A chemical reactor model and its application to a practical combustor N80-27392
Combustion modelling within gas turbine engines, some applications and limitations N80-27394
Aerodynamic study of a combustion chamber with a view to its semi-empirical modelling N80-27395
Computation of the turbulent mixing in curved ejectors --- V/STOL aircraft
[AD-A083905] N80-27634
Computer modeling of pulsed chemical lasers
[AD-A083648] N80-27686
Hydrolyzed wood slurry flow modeling --- hydrocarbon fuel production
[LBL-10090] N80-27703
Development and application of a computational shear band model
[AD-A084029] N80-27721
Integrated Noise Model (INM). Version 2. User's guide
[AD-A079493] N80-27840
Investigation of a seismic model using a three layer model N80-27895
Select research group in air pollution meteorology
[PB80-166879] N80-27966
First generation numerical ocean prediction models: Goal for the 1980's
[AD-A083855] N80-27976
Measurement of lung function using magnetometers. 1: Principles and mathematical modeling
[AD-A083910] N80-28038
A mathematical model for use in evaluating and developing impact test methods for protective headgear
[PB80-164957] N80-28055
Investigation into adaptive control of a slip-cast, reaction-bonded silicon-nitride process via adaptive learning network modeling
[AD-A083730] N80-28091
A prediction interval for a first order Gaussian Markov process
[AD-A084094] N80-28137
Application of best linear unbiased prediction to interpolation of random fields and to network design
[AD-A083656] N80-28144
Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175
Heat transport due to the collisionless tearing instabilities
[IPPJ-461] N80-28197

MATRICES (MATHEMATICS)
Quiet radar processor analysis by covariance matrix transformations
[AD-A084453] N80-27585
A simple derivation of Glassman's general N fast Fourier transform
[AD-A083811] N80-28104

MATRIX METHODS
Feasibility of Kevlar 49/PMR-15 polyimide for high temperature applications
[NASA-TM-81560] N80-27429

MAXIMUM LIKELIHOOD ESTIMATES
Rates of convergence for estimation and testing in multinomial distributions N80-28125
On probability distributions involving the Stirling numbers N80-28130
Maximum likelihood estimation of the survival functions of stochastically ordered random variables
[AD-A083903] N80-28132
Contingency tables
[AD-A084262] N80-28134

MEASURING INSTRUMENTS
The F-4 service life tracking program crack growth gages
[AD-A083978] N80-27353
Road rater and Benkelman beam pavement deflections
[PB80-158439] N80-27530

MECHANICAL DRIVES
Release mechanism for releasing and reattaching experiments on the Space Shuttle
[NASA-TP-1702] N80-27694

MECHANICAL ENGINEERING
Modeling the combustion chamber of a gas turbine: A mechanics viewpoint N80-27372

MECHANICAL PROPERTIES
The effects of non-carbide forming elements on the mechanical properties and microstructure of a secondary hardening steel N80-27465
An investigation of the microstructure and mechanical properties of thick section Cr-Mo steels N80-27467
Tear strength and tensile strength of model filled elastomers
[AD-A083168] N80-27485
Mechanical properties data center
[AD-A083123] N80-28237

MEMBRANE STRUCTURES
Upgrading efficacy of membrane techniques for regenerating water from urine N80-28035

MERCURY (METAL)
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170

MERIDIONAL FLOW
Transports by nonlinear baroclinic waves N80-27949

MESOMETEOROLOGY
A preliminary look at AVE-SESAME 2 conducted on 19-20 April 1979
[NASA-TM-78280] N80-27916

MESOSCALE PHENOMENA
Space and time scales of ocean circulation --- mid-ocean circulation experiments N80-27747
Select research group in air pollution meteorology
[PB80-166879] N80-27966

MESSAGES
Satellite and missile data generation for AIS
[AD-A084326] N80-28143

METABOLISM
Calorigenic effect of adrenaline in rats under conditions of restricted motor activity
[NASA-TM-76192] N80-27988
Changes of the body functions during long-term hypokinesia
[NASA-TM-76166] N80-28041

METAL BONDING
Ultrasonically activated diffusion bonding for fluidic control assembly
[AD-A084658] N80-27702

METAL COATINGS
Effect of CVD tungsten and IaC coatings on the mechanical behavior of SiC(C)
[AD-A083395] N80-27488

METAL CRYSTALS
The determination of electronic states in crystalline semiconductors and metals by angle-resolved photoemission N80-28216

METAL FATIGUE
The effect of microstructure on the properties of high strength aluminum alloys
[AD-A083768] N80-27474

METAL FOILS
Ultrasonically activated diffusion bonding for fluidic control assembly
[AD-A084658] N80-27702

METAL HALIDES
Structure of complexes between aluminum chloride and other chlorides, 2: Alkali-(chloroaluminates). Gaseous complexes
[NASA-TM-75762] N80-27452

METAL IONS
Functional polymers for removal of heavy-metal Pollutants from water
[PB80-158215] N80-27846

METAL OXIDE SEMICONDUCTORS
Oxidation of gallium arsenide in a plasma multipole device. Study of the MOS structures obtained
[NASA-TM-75471] N80-27451
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27796

METAL SHEETS
Plastic deformation and ductile fracture at an angle slit in a sheet under tension
[AD-A084564] N80-27726

METAL SURFACES
A multitechnique approach to surface studies of metals and alloys using X-ray photoelectron spectroscopy and secondary ion mass spectroscopy N80-27443
Fundamental studies of the structure and chemistry of solid surfaces --- hydrazine decomposition
[AD-A083964] N80-27475
Surface properties of antiferromagnetic metals and alloys N80-28217

METALLOIDS
The magnetic properties of amorphous (Fe-Ni-Co): Metalloid alloys N80-27472

METALS
Evaluation of a proposed ASTM (American Society for Testing and Materials) standard guide to assess the compatibility of metal-heat transfer liquid pairs in solar heating and cooling systems
[PB80-161748] N80-27826
Mechanical properties data center
[AD-A083123] N80-28237

METASTABLE ATOMS
Inelastic collisions of excited atoms
[AD-A084524] N80-28172

METASTABLE STATE
Beta decomposition in binary Ti-Cr alloys N80-27459

METEOROLOGICAL CHARTS
A preliminary look at AVE-SESAME 2 conducted on 19-20 April 1979
[NASA-TM-78280] N80-27916

METEOROLOGICAL FLIGHT
Provide aircraft operation and analysis for SESAME-79 --- support for severe storms research
[PB80-165301] N80-27970

METEOROLOGICAL PARAMETERS
Meteorological research --- optimization of processing techniques applied to satellite sounding data N80-27738
Space techniques --- for measuring meteorological parameters N80-27739
Meteorological research and cloud parameter derivation from satellite data N80-27755
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757
Analysis of meteorological observations from an array of buoys during JASIN
[AD-A084034] N80-27960

METEOROLOGICAL RADAR
Numerical simulation of hurricanes using radar and satellite-derived rainfall N80-27910

METEOROLOGICAL SATELLITES
Meteorological satellites
[NASA-TM-80704] N80-27914
A study of the use of meteorological satellite, weather radar, and integrated graphics products in the flight service station system
[AD-A084012] N80-27961

METEOROLOGY
Select research group in air pollution meteorology
[PB80-166879] N80-27966

METEOSAT SATELLITE
The Meteosat data collection system and its potential as a data relay for geophysical measurements N80-27890

METHANE
Shock tube studies of the N2O/CH4/CO/Ar systems
[AD-A083722] N80-27455

METHYL COMPOUNDS
Crossed beam studies of full and half collisions N80-28186

MEXICO
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774

MICROELECTRONICS
Properties of superconductor-normal metal-superconductor microbridges N80-28215

MICROPARTICLES
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964
MICROPROCESSORS
Applications of microprocessors in air traffic
N80-27341
A microprocessor based high speed packet switch for satellite communications
[NASA-CR-163357] N80-27557
A microprocessor based high speed packet switch for satellite communications, executive summary
[NASA-CR-163357] N80-27558
Printed circuits. Citations from the Engineering Index data base
[PB80-807571] N80-27814
True-integrating environmental noise monitor and sound-exposure level meter. Volume 3: Microprocessor program and data interface description
[AD-A083320] N80-28156
MICROSTRIP TRANSMISSION LINES
Theoretical studies of microstrip antennas. Volume 2: Analysis and synthesis of multi-frequency elements
[AD-A075540] N80-27569
MICROSTRUCTURE
An investigation of the microstructure and mechanical properties of thick section Cr-Mo steels
N80-27467
The mechanism of microstructural change and its consequences in a low carbon 5 nickel alloy
N80-27468
Beta decomposition in binary Ti-Cr alloys
N80-27469
The microstructural behavior of austenite due to hot rolling N80-27471
The effect of microstructure on the properties of high strength aluminum alloys
[AD-A083768] N80-27474
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N4&w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484
Chemical, structural and optical characterization of a black chrome solar selective absorber
N80-27797
MICROWAVE EMISSION
A comparison of radiative transfer models for predicting the microwave emission from soils
[NASA-TM-80686] N80-27777
MICROWAVE EQUIPMENT
Superconductor insulator superconductor quasiparticle tunnel junctions as microwave receivers
N80-28214
MICROWAVE IMAGERY
A cylindrical cloud model for microwave and infrared radiative transfer-applications to defense meteorological satellite program microwave sounders
N80-27912
MICROWAVE LANDING SYSTEMS
Technical and operational factors concerning the licensing and introduction of a new microwave landing system for category 2 N80-27336
The integration of area navigation and the microwave landing system N80-27337
Evolution and transition of today's military landing system to compatibility with present and future civil military systems --- multimode receivers and the marine remote area approach landing system N80-27339
MICROWAVE OSCILLATORS
Microwave oscillators. Citations from the NTIS data base
[PB80-808280] N80-27616
MICROWAVE RADIOMETERS
Large Antenna Multifrequency Microwave Radiometer (LAMMR) system design
[NASA-TM-80685] N80-27675
Snowpack monitoring in North America and Eurasia using passive microwave satellite data
[NASA-TM-80706] N80-27779
MICROWAVE SENSORS
A microwave pressure sounder for the remote measurement of atmospheric surface pressure
N80-27758
MICROWAVE TRANSMISSION
Solar power satellite system definition study. Volume 4: Solid states SPS Analysis, phase 3
[NASA-CR-160745] N80-27812
MICROWAVES
Microwave oscillators. Citations from the Engineering Index data base
[PB80-808298] N80-27617
Semiconductor measurment technology: Modulation measurements for microwave mixers
[PB80-168952] N80-27618
Biological effects of microwaves. Citations from the NTIS data base
[PB80-808256] N80-28050
MIDAIR COLLISIONS
Probabilities of vertical overlap: A sensitivity analysis --- vertical separation standards for aircraft
[PB80-181151] N80-27323
MILITARY AIR FACILITIES
SSILS initial evaluation report, Davis-Monthan AFB, Arizona, 16-20 November 1979
[AD-A084635] N80-27320
MILITARY AVIATION
Data link: The key to improvements in civil/military air traffic management? N80-27330
Midair conflicts and their potential avoidance by progressive implementation of automation
N80-27331
US Army users outlook on air traffic management
N80-27333
Evolution and transition of today's military landing system to compatibility with present and future civil military systems --- multimode receivers and the marine remote area approach landing system N80-27339
MILITARY HELICOPTERS
The development and test of a tactical self-contained landing system --- landing military helicopters when the safe corridor is unknown N80-27334
MILITARY TECHNOLOGY
Air Traffic Management: Civil/Military System and Technologies --- conference
[AGARD-CP-273] N80-27324
MILKY WAY GALAXY
Infrared fine-structure line emission from the galactic center N80-28269
The distribution of G5-K5 stars in a region at the South Galactic Pole N80-28276
MILLIMETER WAVES
Effect of various dielectrics on the design of millimeter-wave line scanning antennas
[AD-A083791] N80-27586
A comprehensive review of traveling wave tube technology
[AD-A083899] N80-27603
MINES (EXCAVATIONS)
Dewatering systems for surface coal mines
[PB80-160153] N80-27789
MINICOMPUTERS
Generalized Approach to New Problems in Ultrasonic Inspection (GANPUI)
[AD-A083931] N80-27709
MINING
Research on the hydrology and water quality of watersheds subjected to surface mining. Phase 1: Premining hydrologic and water quality conditions --- Ohio
[PB80-159510] N80-27784
Sonar probing as a mining and tunneling tool
[PB80-159239] N80-27790
MIRRORS
Equilibrium and stability in strongly inhomogeneous plasmas --- confinement schemes including field-reversed mirrors and tokamak sheaths
N80-28158
MIS (SEMICONDUCTORS)
Current conduction mechanism and design optimization study of MIS solar cells N80-27796
MISSILE TRACKING
Satellite and missile data generation for AIS
[AD-A084326] N80-28143
MISSION PLANNING
Shuttle program. STS-7 conceptual flight profile. IUS/TDRS-A
[NASA-TM-81090] N80-27405
Shuttle program: OFT ascent/descent ancillary data requirements document
[NASA-TM-81095] N80-27410
A concept for developing human performance specifications
[AD-A084617] N80-28054
MIXERS
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632
MIXING
Coalescence/dispersion modelling of gas turbine combustors N80-27384
MIXING CIRCUITS
Superconductor insulator superconductor quasiparticle tunnel junctions as microwave receivers
N80-28214
MODELS
Nonlinearities in auditory-nerve fiber responses to bandlimited noise: An experimental study and a model N80-28037
MODULUS OF ELASTICITY
Elasticity theory of composites
[AD-A083173] N80-27431
Flexible pavement deflection equation using elastic moduli and field measurements
[PB80-159247] N80-27542
Fully flooded elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81543] N80-27698
Starved elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81549] N80-27699
MOISTURE CONTENT
Moisture determination in composite materials using positron lifetime techniques
[NASA-TP-1881] N80-27428
Remote sensing of soil moisture content over bare fields at 1.4 GHz frequency
[NASA-TM-80711] N80-27780
MOLECULAR BEAMS
Crossed beam studies of full and half collisions
N80-28166
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170
Inelastic collisions of excited atoms
[AD-A084524] N80-28172
Crossed molecular beam study of the reactions of oxygen and fluorine atoms
[AD-A084255] N80-28174
High resistivity molecular beam epitaxial AlGaAs for device applications
[AD-A083778] N80-28221
MOLECULAR COLLISIONS
Crossed beam studies of full and half collisions
N80-28166
Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28169
MOLECULAR ENERGY LEVELS
Studies in intramolecular motion N80-28161
MOLECULAR INTERACTIONS
Structure of complexes between aluminum chloride and other chlorides. 2: Alkali-(chloroaluminates). Gaseous complexes
[NASA-TM-75762] N80-27452
The Boltzman equation with a soft potential. Part 2: Nonlinear, spatially-periodic
[AD-A083813] N80-28099
Studies in intramolecular motion N80-28161
Multiphoton processes in isolated atoms and molecules N80-28164
MOLECULAR IONS
Low energy ion molecule reactions in chemical ionization by mass-analyzed ion kinetic energy spectrometry N80-27448
Laser induced fluorescence of trapped molecular ions N80-28165
MOLECULAR RELAXATION
Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28169
MOLECULAR SHIELDS
Processing of materials in space --- using the molecular shield and space shuttle
[ISRO-SN-04-78] N80-27401
MOLECULAR STRUCTURE
Structure of complexes between aluminum chloride and other chlorides. 2: Alkali-(chloroaluminates). Gaseous complexes
[NASA-TM-75762] N80-27452
Fundamental studies of the structure and chemistry of solid surfaces --- hydrazine decomposition
[AD-A083964] N80-27475
Surveys of high-pressure effects in solids
[AD-A083728] N80-27722

MOLECULES
A computer graphics system for macromolecular model building N80-28068
MOMENT DISTRIBUTION
Inelastic analysis and design of cold-formed steel beams with stiffened compression flanges N80-27715
An anomaly in the Pearson product-moment correlation coefficient
[AD-A084354] N80-28136
MONITORS
True-integrating environmental noise monitor and sound-exposure level meter. Volume 4: Mechanical construction and electrical check out
[AD-A083321] N80-28155
MONOPULSE ANTENNAS
Focal axis resolver for offset reflector antennas
[NASA-TM-80683] N80-27555
MONTANA
Cambrian stratigraphy of the Libby Trough, Montana N80-27858
MONTE CARLO METHOD
STS-1 operational flight profile. Volume 5: Descent, cycle 3. Appendix C: Monte Carlo dispersion analysis
[NASA-TM-81097] N80-27412
A Monte Carlo approach to the sampling error of estimates of the generalizability statistics from a two facet completely crossed generalizability study N80-28127
MORPHOLOGY
Determination of morphology and electronic structure in solids with 20-1000 eV radiation N80-28206
MOSAICS
Fitting mosaic models to textures
[AD-A084291] N80-28115
MOTOR VEHICLES
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-165269] N80-28262
Identification of superior energy-absorbing materials for school bus interiors. Volume 2: Technical report
[PB80-165277] N80-28263
MOVING TARGET INDICATORS
Air to air helicopter fire control equations and software generation
[AD-A084115] N80-27359
MULTIPATH TRANSMISSION
HF direction finding by waterfront testing
[AD-A084549] N80-27584
MULTIPHOTON ABSORPTION
Multiphoton processes in isolated atoms and molecules N80-28164
MULTIPOLES
Oxidation of gallium arsenide in a plasma multipole device. Study of the MOS structures obtained
[NASA-TM-75471] N80-27451
MULTIVARIATE STATISTICAL ANALYSIS
Dependent relevations
[AD-A084543] N80-28119
Modeling and investigation of periodic phenomena using techniques of time series analysis N80-28129
MUSCULOSKELETAL SYSTEM
Mechanisms of water-salt metabolism disturbances in dogs subjected to six month hypokinesia
[NASA-TM-76170] N80-27984
Effect of transverse accelerations on innervation of the guinea pig's crural skeletal muscles N80-28005
Evaluation of efficacy of the set of preventive measures referable to the human neuromuscular system under hypokinetic conditions N80-28007

N

N-TYPE SEMICONDUCTORS
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170
NASA PROGRAMS
Authorizing appropriations of the National Aeronautics and Space Administration
[HR-REPT-96-1142] N80-28242
NASA authorization, 1981, volume 4
[GPO-61-147] N80-28243
A regional technology transfer program --- North Carolina Industrial Applications Center for the Southeast
[NASA-CR-163360] N80-28253
NATIONAL AIRSPACE UTILIZATION SYSTEM
Analysis of expandability and modifiability of computer configuration concepts for ATC. Volume 1: Distributed concept
[AD-A084045] N80-27314
NATURAL LANGUAGE (COMPUTERS)
Treatment of ungrammatical and extragrammatical phenomena in natural language understanding systems N80-28064
NAVIER-STOKES EQUATION
A second order accurate numerical method for supersonic boundary layer flow past a compression corner
[AD-A084550] N80-27294
Combustor modelling for scramjet engines N80-27379
Research on numerical algorithms for the three dimensional Navier-Stokes equations. 1: Accuracy, convergence and efficiency
[AD-A083664] N80-27633
A Navier-Stokes fast solver for turbulence modeling applications N80-27659
NAVIGATION AIDS
Precision navigation for air traffic management N80-27342
JTIDS: An integrated communications navigation and identification system, and its potential for air traffic management N80-27343
NEAR WAKES
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
NETWORK ANALYSIS
On the spatial capacity of packet radio networks N80-27549
Modeling and analysis of switched interconnection networks N80-27594
Solution approaches for network flow problems with multiple critera
[AD-A084283] N80-28146
NETWORK SYNTHESIS
Approximate solutions of queueing network models of computer systems N80-28086
Variance reduction techniques for the simulation of queueing networks N80-28088
Application of best linear unbiased prediction to interpolation of random fields and to network design
[AD-A083656] N80-28144
NEUROMUSCULAR TRANSMISSION
Effect of transverse accelerations on innervation of the guinea pig's crural skeletal muscles N80-28005
Evaluation of efficacy of the set of preventive measures referable to the human neuromuscular system under hypokinetic conditions N80-28007
NEUROTROPISM
Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981
Effect of central neurotropic substances on the hypophysisadrenal cortex system during immobilization of animals
[NASA-TM-76158] N80-27982
The content of catecholamines in the adrenal glands and sections of the brain under hypokinesia and injection of some neurotropic agents
[NASA-TM-76010] N80-28044
NEUTRON STARS
Comptomization and radiation spectra of X-ray sources. Calculation of the Monte Carlo method
[NASA-TM-76181] N80-28193
NEW ENGLAND (US)
Study of New England utilities' particulate air pollution control facilities to determine relative viability of approaches to upgrade and retrofit
[PB80-154073] N80-27849
NEW HAMPSHIRE
Solar energy system performance evaluation: Seasonal report for Contemporary-Manchester, Manchester, New Hampshire
[NASA-CR-161471] N80-27802
NICKEL
The magnetic properties of amorphous (Fe-Ni-Co): Metalloid alloys N80-27472
NICKEL ALLOYS
Optical spectroscopy of molecules absorbed on the nickel (111) surface N80-27446
The sulfidation behavior of nickel-chromium, nickel-aluminum, and nickel-chromium-aluminum alloys with and without yttrium N80-27466
The mechanism of microstructural change and its consequences in a low carbon 6 nickel alloy N80-27468
Electronic effects of sulfur in nickel: A model for grain boundary embrittlement
[AD-A083649] N80-27477
The effect of ion plating and ion implantation on the cyclic response and fatigue crack initiation of metals and alloys
[AD-A083643] N80-27478
Determination of residual stress by magnetomechanical acoustic emission
[AD-A084065] N80-27479
NIGHT SKY
Nonlinear equatorial spread F: Spatially large bubbles resulting from large horizontal scale initial perturbations
[AD-A083903] N80-27903
NITROUS OXIDES
The influence of NO and ClO variations at twilight on the interpretation of solar occultation measurements N80-27868
NOAA SATELLITES
The NOAA SEL HF radar system (ionospheric sounder)
[PB80-160989] N80-27905
NOISE (SOUND)
Study of cost/benefit tradeoffs available in helicopter noise technology applications
[AD-A083955] N80-27354
Nonlinearities in auditory-nerve fiber responses to bandlimited noise: An experimental study and a model N80-28037
NOISE INTENSITY
True-integrating environmental noise monitor and sound-exposure level meter. Volume 3: Microprocessor program and data interface description
[AD-A083320] N80-28156
NOISE MEASUREMENT
Time-of-Day Corrections to Aircraft Noise Metrics
[NASA-CP-2135] N80-28150
Historical development of noise exposure metrics N80-28151
Research perspective: Time-of-day effects on noise annoyance N80-28152
True-integrating environmental noise monitor and sound-exposure level meter. Volume 4: Mechanical construction and electrical check out
[AD-A083321] N80-28155
Correction procedures for aircraft noise data. Volume 1: Pseudotones
[AD-A081962] N80-28157
Correction procedures for aircraft noise data. Volume 2: Background noise considerations
[AD-A082011] N80-28158
NOISE METERS
True-integrating environmental noise monitor and sound-exposure level meter. Volume 4: Mechanical construction and electrical check out
[AD-A083321] N80-28155
True-integrating environmental noise monitor and sound-exposure level meter. Volume 3: Microprocessor program and data interface description
[AD-A083320] N80-28156
NOISE POLLUTION
Annoyance due to noise and air pollution to the residents of heavily frequented streets
[NASA-TM-75496] N80-27833
Noise levels near streets, effectiveness and cost abatement measures
[NASA-TM-75814] N80-27834
Construction and application of a questionnaire for the social scientific investigation of environmental noise effects
[NASA-TM-75492] N80-27835
Noise Abatement Economic Policy Analysis Model NAEPAM. Volume 2: User's guide
[AD-A081159] N80-27838
Noise Abatement Economic Policy Analysis Model NAEPAM, volume 1
[AD-A081190] N80-27839
Integrated Noise Model (INM). Version 2. User's guide
[AD-A079493] N80-27840

FAA integrated noise model validation. Phase 1: Analysis of integrated noise model calculations for air carrier flyovers
[AD-A081426] N80-27842

NOISE PREDICTION (AIRCRAFT)
FAA integrated noise model validation. Phase 1: Analysis of integrated noise model calculations for air carrier flyovers
[AD-A081426] N80-27842
Time-of-Day Corrections to Aircraft Noise Metrics
[NASA-CP-2135] N80-28150
Historical development of noise exposure metrics
N80-28151
Research perspective: Time-of-day effects on noise annoyance N80-28152

NOISE REDUCTION
Study of cost/benefit tradeoffs available in helicopter noise technology applications
[AD-A083955] N80-27354
Costs and benefits of requiring new production of older aircraft types to meet amended noise standards
[AD-A080130] N80-27356
Cost/benefit tradeoffs available in aircraft noise technology applications in the 1980's
[AD-A082028] N80-27357
Influence of noise reduction on weight and cost of general aviation propellers
[AD-A082120] N80-27366
High power HF and noise cancellation system
[AD-A084016] N80-27562
Noise levels near streets, effectiveness and cost abatement measures
[NASA-TM-75814] N80-27834
Community noise exposure resulting from aircraft operations. Volume 7: Acoustic data on aircraft ground runup noise suppressors
[AD-A083701] N80-27837
Noise Abatement Economic Policy Analysis Model NAEPAM. Volume 2: User's guide
[AD-A081159] N80-27838
Noise Abatement Economic Policy Analysis Model NAEPAM, volume 1
[AD-A081190] N80-27839

NOISE SPECTRA
Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery noise
[AD-A084355] N80-27369

NOISE TOLERANCE
Time-of-Day Corrections to Aircraft Noise Metrics
[NASA-CP-2135] N80-28150
Historical development of noise exposure metrics
N80-28151
Research perspective: Time-of-day effects on noise annoyance N80-28152

NONDESTRUCTIVE TESTS
Primary Adhesive Bonded Structure Technology (PABST). Phase 3: Tooling, fabrication and quality assurance
[AD-A083228] N80-27486
Generalized Approach to New Problems in Ultrasonic Inspection (GANPUI)
[AD-A083931] N80-27709
X-Ray techniques for the measurement of residual stresses in the real world
[AD-A083796] N80-27711
Interdisciplinary study on advanced NDI techniques
[AD-A084242] N80-27712

NONFERROUS METALS
Control of Particulate Emissions in the Primary Nonferrous Metals Industries --- conference
[PB80-151822] N80-27847

NONLINEAR EQUATIONS
The Boltzman equation with a soft potential. Part 2: Nonlinear, spatially-periodic
[AD-A083813] N80-28099
Coincident bifurcation of equilibrium and periodic solutions of evolution equations
[AD-A083810] N80-28101
High order difference methods for quasilinear elliptic boundary value problems on general regions
[AD-A083824] N80-28102
Contingent derivatives of set-valued maps and solutions to nonlinear inclusions and differential inclusions
[AD-A083826] N80-28108
Analysis of computational methods for nonlinear parabolic differential systems
[AD-A084236] N80-28122

NONLINEAR SYSTEMS
Interactive nonlinear structural analysis. A review of the GIFTS-STAGS union
[AD-A084209] N80-28073
Control of nonlinear systems
[AD-A083963] N80-28089
Forced oscillations of nonlinear Hamiltonian systems. 2
[AD-A083812] N80-28100

NONLINEARITY
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543
Non-linear junction characterization
[AD-A083898] N80-27602
Nonlinearities in auditory-nerve fiber responses to bandlimited noise: An experimental study and a model N80-28037
Equilibria of the curvature functional and manifolds of nonlinear interpolating spline curves
[AD-A083807] N80-28106
A nonlinear Volterra equation in variable domain --- nonlinear heat flow equation
[AD-A083829] N80-28107
Nonlinear wave evoluation in Vlasov plasma. A Lie transform N80-28190

NONNEWTONIAN FLOW
The study of non-Newtonian flows in the falling ball viscometer N80-27621

NONPARAMETRIC STATISTICS
ONESAM, a computer program for nonparametric data analysis and density quantile estimation
[AD-A084259] N80-28077

NONUNIFORM FLOW
Experimental study of coherent structures in the turbulent boundary layer of pipe flow using laser-Doppler anemometry N80-27650

NONUNIFORM PLASMAS
Reflection of oblique electron thermal modes in an inhomogenous plasma
[IPPJ-457] N80-28192

NORMAL DENSITY FUNCTIONS
Sample size determinations for some reliability problems N80-27706
An investigation of outlier definition and the impact of the masking phenomenon on several statistical outlier tests N80-28126

NORTH AMERICA
The kinetic energy climatology of tropospheric and lower stratospheric flow regimes associated with 500 MB intermediate and short waves over North America N80-27863

NORTH ATLANTIC TREATY ORGANIZATION (NATO)
Air Traffic Management: Civil/Military System and Technologies --- conference
[AGARD-CP-273] N80-27324
Air traffic in NATO Europe: Its characteristics and its needs N80-27325

NORTH CAROLINA
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
A regional technology transfer program --- North Carolina Industrial Applications Center for the Southeast
[NASA-CR-163360] N80-28253

NORTHERN HEMISPHERE
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

NORWAY
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

NOZZLE FLOW
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632

NUCLEAR FUSION
Comparative study of energy accounting for heavy ion fusion with various driver accelerators
[IPPJ-454] N80-28195
Surface study of fusion research in universities linkage organization
[IPPJ-455] N80-28196

NUCLEAR MAGNETIC RESONANCE
The 1H and 13C Fourier transform NMR characterization of jet fuels derived from alternated energy sources
[AD-A084169] N80-27513
Instrumentation for the measurement of viscosity and flow of biological fluids --- neuclear magnetic resonance N80-27980
Pulsed NMR and zero sound measurements in superfluid helium-three N80-28204

NUMERICAL ANALYSIS
Numerical calculation of transonic axial turbomachinery flows
[NASA-TM-81544] N80-27363
Analysis of low-frequency disturbances in afterburners N80-27386
Numerical analysis and experimental data in a continuous flow combustion chamber: A comparison N80-27388
Dynamic analysis of noncontacting face seals
[NASA-TM-79294] N80-27695
Programming language facilities for numerical computation
[AD-A083815] N80-28069
Optimal simplex tableau characterization of unique and bounded solutions of linear programs
[AD-A083816] N80-28109
Resonant interaction of solitons and Zakharov-Shabat theory
[IPPJ-456] N80-28194
Interaction of ion-acoustic solitons in two-dimensional space
[IPPJ-459] N80-28196
Accurate analytic approximations and numerical solutions for the structure of quasi-static laser driven ablation layers
[AD-A083913] N80-28200

NUMERICAL CONTROL
The independence of control structures in abstract programming systems N80-28084

NUMERICAL FLOW VISUALIZATION
Airfoils at sonic velocity --- Tricomi equation
N80-27278

NUMERICAL INTEGRATION
Shuttle program. Onorbit navigation integrator results for typical shuttle orbits
[NASA-TM-81092] N80-27407
The response of turbine engine rotors to interference rubs
[NASA-TM-81518] N80-27696

NUMERICAL STABILITY
Numerical simulation of the global circulation of the atmosphere --- hydrodynamics N80-27927

NUMERICAL WEATHER FORECASTING
Atmospheric models --- data requirements
N80-27740

NUTRITIONAL REQUIREMENTS
The question of using dehydrated foods during long-term space flights N80-28031

NYLON (TRADEMARK)
Piezoelectricity in nylon 11
[AD-A083719] N80-27609

NYSTAGMUS
Generalized nystagmometric characteristics for diagnostic purposes N80-28034

O

OCEAN BOTTOM
A model of a suspended sediment induced, stably stratified oceanic bottom boundary layer
N80-27974
Bottom-water temperature trends in the Middle Atlantic Bight during spring and autumn, 1964-76
[PB80-166200] N80-27977

OCEAN CURRENTS
The Earth's hydrosphere and cryosphere --- role of ocean circulation in models of climatic changes with emphasis on ocean surface temperature
N80-27736
Space and time scales of ocean circulation --- mid-ocean circulation experiments N80-27747
Ocean circulation --- validating models with altimeter and wind data from satellites N80-27760

Assessment of atmospheric height uncertainties for high precision satellite altimeter missions to monitor ocean currents
[NASA-CR-156868] N80-27873
Models of the ocean circulation and the global heat balance N80-27920
The Meteorological Office 5-layer general circulation model --- sea surface parameters N80-27925
Simulation of January climate with a general circulation model --- realization of baroclinic instability as well as interaction between the oceans and the atmosphere N80-27928
On the simulation of the oceanic general circulation N80-27939
The annual variability of sea surface temperature: Observation and simulation N80-27940
Profiles of velocity and temperature near the Indian Ocean Equator, revision
[AD-A083779] N80-27975

OCEAN DATA ACQUISITIONS SYSTEMS
Space and time scales of ocean circulation --- mid-ocean circulation experiments N80-27747

OCEAN MODELS
Models of the ocean circulation and the global heat balance N80-27920
On the simulation of the oceanic general circulation N80-27939
The annual variability of sea surface temperature: Observation and simulation N80-27940
A simple sea-ice/ocean-temperature oscillator model N80-27951
Views of the future development, application and validation of general circulation models N80-27957
First generation numerical ocean prediction models: Goal for the 1980's
[AD-A083855] N80-27976

OCEAN SURFACE
Stochastic processes in the atmosphere-ocean system --- and modeling sea surface temperature anomalies N80-27741
Satellite altimetry measurements of the sea surface N80-27748
The effects of surface phenomena on the spreading of oil on water
[PB80-163629] N80-27850
Preliminary investigations of the electrical response of water surfaces during marine thunderstorms N80-27911
The Meteorological Office 5-layer general circulation model --- sea surface parameters N80-27925
Simulation of January climate with a general circulation model --- realization of baroclinic instability as well as interaction between the oceans and the atmosphere N80-27928
Response of the NCAR general circulation model to changed ocean surface temperature N80-27930
Statistical assessments of sea temperature anormaly experiments --- effects of sea surface temperature anomalies on the atmosphere N80-27931
Effect of a Pacific sea-surface temperature anomaly on the circulation over North America: A numerical experiment with the GLAS model N80-27932
A simple model of the atmospheric response to a tropical sea-surface temperature anomaly N80-27933

OCEAN THERMAL ENERGY CONVERSION
Physical oceanographic conditions at a potential OTEC site in the Gulf of Mexico, 88 deg W, 29 deg N
[PB80-163710] N80-27978

OCEANOGRAPHIC PARAMETERS
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757
Physical oceanographic conditions at a potential OTEC site in the Gulf of Mexico, 88 deg W, 29 deg N
[PB80-163710] N80-27978

OFFSHORE PLATFORMS
Physical oceanographic conditions at a potential OTEC site in the Gulf of Mexico, 88 deg W, 29 deg N
[PB80-163710] N80-27978

OHIO
Research on the hydrology and water quality of watersheds subjected to surface mining. Phase 1: Premining hydrologic and water quality conditions --- Ohio
[PB80-159510] N80-27784

OIL SLICKS
The effects of surface phenomena on the spreading of oil on water
[PB80-163629] N80-27850

OKLAHOMA
Red River Valley tornadoes of April 10, 1979. A report to the administrator
[PB80-165210] N80-27968

ON-LINE PROGRAMMING
On homogeneity and on-line-off-line behavior in M/G/1 queueing systems
[AD-A083827] N80-28090
Data base management. Citations from the NTIS data base
[PB80-808165] N80-28228
Data base management. Citations from the Engineering Index data base
[PB80-808173] N80-28229

ONBOARD EQUIPMENT
Provide aircraft operation and analysis for SESAME-79 --- support for severe storms research
[PB80-165301] N80-27970

ONTARIO
Evaluation of the vertical axis wind turbine at DREO
[AD-A083961] N80-27814

OPERATING SYSTEMS (COMPUTERS)
As-built specification for the ERIM tape conversion to LARSYS 2 program (ECTL2)
[E80-10202] N80-27768
Final design specification for LARSYS/ISOCLS modification for LACIE phase 3
[E80-10212] N80-27769

OPERATIONS RESEARCH
Operation of a central preparation plant for coal-oil-water mixtures N80-27500
Solar power satellite system definition study. Volume 1: Executive summary, phase 3
[NASA-CR-160742] N80-27809
On homogeneity and on-line-off-line behavior in M/G/1 queueing systems
[AD-A083827] N80-28090
Optimal simplex tableau characterization of unique and bounded solutions of linear programs
[AD-A083816] N80-28109

OPERATOR PERFORMANCE
The evaluation of a methodology to measure manual digitizing error in cartographic data bases N80-27761
Response time, operator productivity and job satisfaction N80-28053

OPTICAL COMMUNICATION
Manufacturing methods and technology program for ruggedized tactical fiber optic cable
[AD-A084191] N80-28182

OPTICAL DATA PROCESSING
A note on the generation of Poisson-distributed random numbers with large mean
[E80-10224] N80-27773

OPTICAL EMISSION SPECTROSCOPY
The determination of electronic states in crystalline semiconductors and metals by angle-resolved photoemission N80-28216

OPTICAL EQUIPMENT
The High Visible Resolution (HVR) instrument of the spot ground observation satellite
[NASA-TM-75830] N80-27781

OPTICAL MEMORY (DATA STORAGE)
Hybrid image processing system
[AD-A084563] N80-28070

OPTICAL PROPERTIES
Optical properties and solar selectivity of metal-insulator composite films N80-28177
Determination of the optical constants of highly absorbing materials in the infrared region
[AD-A083883] N80-28181
Optical studies of the interface states at GaAs-metal Schottky barrier junctions
[AD-A083758] N80-28220

OPTICAL PUMPING
Visible laser research one meter device
[AD-A084196] N80-27688

OPTICAL RADAR
Airborne laser topographic mapping results from initial joint NASA/US Army Corps of Engineers experiment
[NASA-TM-73287] N80-27782
Remote measurements of air pollutants
[PB80-164791] N80-27852

OPTICAL TRACKING
Activities of the Kloppenheim satellite observation station
[SER-B-230] N80-28292

OPTICAL WAVEGUIDES
Phase conjugate optics: On the theory, observation, and utilization of temporally-reversed wavefronts as generated via nonlinear optical parametric interactions N80-28178
Manufacturing methods and technology program for ruggedized tactical fiber optic cable
[AD-A084191] N80-28182

OPTIMIZATION
The optimization of query processing on distributed database systems N80-28087

ORBITAL ASSEMBLY
Space Construction Automated Fabrication Experiment Definition Study (SCAFEDS), part 3. Volume 3: Requirements
[NASA-CR-160747] N80-27399

ORBITAL MANEUVERS
Shuttle program. Onorbit navigation integrator results for typical shuttle orbits
[NASA-TM-81092] N80-27407

ORBITAL MECHANICS
An analytical integration of the averaged equations of variation due to sun-moon perturbations and its application
[AD-A083231] N80-28281

ORDER-DISORDER TRANSFORMATIONS
A Monte Carlo study of crystallization and crystalline order in simple two-dimensional systems N80-28209

ORGANIC COMPOUNDS
Optical spectroscopy of molecules absorbed on the nickel (111) surface N80-27446
Isolation and gas chromatographic demonstration of volatile organic substances in thin-layer biological samples N80-28014

ORGANOMETALLIC COMPOUNDS
Synthesis and characterization of metallo-organic conducting materials with tetraazaannulenes
[AD-A083765] N80-27454

ORGANS
Regional redistribution of rat blood after 7 and 30 days of hypokinesia N80-28009

ORTHOSTATIC TOLERANCE
Studies of prognostic significance of antiorthostatic position N80-28006
Pharmacological analysis of physiological mechanisms of orthostatic hemodynamic stability N80-28026
Bioelectric activity of the human brain during and after 182-day anitorthostatic hypokinesia N80-28027

ORTHOTROPIC PLATES
A boundary layer theory for the anisotropic plate
[AD-A083265] N80-27726

OSCILLATIONS
Forced oscillations of nonlinear Hamiltonian systems, 2
[AD-A083812] N80-28100

OSCILLATORS
Microwave oscillators. Citations from the Engineering Index data base
[PB80-808298] N80-27617

OSO-8
The X-ray spectrum of QSO 0241+622 --- OSO-8 observations
[NASA-TM-80645] N80-28289

OTOLITH ORGANS
Results of the investigation of the otolith function in manned space flights
[NASA-TM-76103] N80-28046

OUTGASSING
System of hygienic inspection of nonmetal materials used in spacecraft equipment N80-28032

OVERPRESSURE
Muzzle blast overpressure levels on the AH-1S helicopter tow sight unit
[AD-A084027] N80-27352

OXIDATION
Chemical kinetic modelling for combustion application N80-27383
Oxidation of gallium arsenide in a plasma multipole device. Study of the MOS structures obtained
[NASA-TM-75471] N80-27451
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N48w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484

OXIDATION RESISTANCE
Effect of W and WC on the oxidation resistance of yttria-doped silicon nitride
[NASA-TM-81528] N80-27483
OXYGEN
Crossed molecular beam study of the reactions of oxygen and fluorine atoms
[AD-A084255] N80-28174
OXYGEN ATOMS
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation N80-27442
OXYGEN CONSUMPTION
Oxygen consumption of animals under conditions of hypokinesia
[NASA-TM-76167] N80-27983
OXYGEN TENSION
Transient diffusion in multi-layer biological tissue N80-27979
OXYGENATION
Modeling furnances fed with oxygen-enriched air N80-27389
OZONE
The kinetics and mechanism of the formation of ozone by the anodic oxidation of water N80-27445
Federal Aviation Administration high altitude pollution program, second biennial report, prepared in accordance with the Ozone Protection provision, section 153g, of the Clean Air Act Amendments of 1977
[AD-A081520] N80-27841
The contribution of ozone aloft to surface ozone maxima N80-27857
Effects of ozone on exercising and sedentary adult men and women representative of the flight attendant population
[AD-A080045] N80-28049
OZONOMETRY
Ozone monitoring from space N80-27752

P

P WAVES
Investigation of a seismic model using a three layer model N80-27895
PACKET SWITCHING
A microprocessor based high speed packet switch for satellite communications
[NASA-CR-163357] N80-27557
A microprocessor based high speed packet switch for satellite communications, executive summary
[NASA-CR-163357] N80-27558
PANCREAS
Secretion, incretion and resecretion of pancreatic lipase during prolonged restriction of motor activity N80-28010
PANEL METHOD (FLUID DYNAMICS)
An improved panel method for the solution of three-dimensional leadingedge vortex flows. Volume 2: User's guide and programmer's document
[NASA-CR-3279] N80-27280
PANELS
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543
PARABOLIC ANTENNAS
Focal axis resolver for offset reflector antennas
[NASA-TM-80663] N80-27555
PARABOLIC DIFFERENTIAL EQUATIONS
Analysis of computational methods for nonlinear parabolic differential systems
[AD-A084236] N80-28122
PARALLEL PROCESSING (COMPUTERS)
Using parallel processing for problem solving
[AD-A084638] N80-28093
PARALLEL PROGRAMMING
Using parallel processing for problem solving
[AD-A084638] N80-28093
PARAMETERIZATION
Free electron lasers with variable parameter wigglers
[AD-A084323] N80-27689
Verification of parameterizations in climate modeling N80-27942
Experiments with some simple zonal average and long wave atmospheric models N80-27946
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models --- latitudinal variation N80-27956
PARTIAL DIFFERENTIAL EQUATIONS
Airfoils at sonic velocity --- Tricomi equation N80-27278
An alternative approach to the numerical simulation
[NASA-TM-81542] N80-27266
The boundary integral equation method applied to free surface flow problems in porous media N80-27762
PARTICLE ACCELERATION
Radiation coupled dynamics of ram confined radio sources N80-27551
Production and investigation of a multi-amphere positron source N80-28189
PARTICLE COLLISIONS
A numerical investigation of the efficiency with which aerosol particles collide with cloud and small rain drops N80-27831
Nonlinear equatorial spread F: Spatially large bubbles resulting from large horizontal scale initial perturbations
[AD-A083393] N80-27903
PARTICLE SIZE DISTRIBUTION
Particle size effects on electrical properties of thick film resistors N80-27596
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964
PASSENGER AIRCRAFT
Lighter than air vehicles. Citations from the NTIS data base
[PB80-808066] N80-27298
Lighter than air vehicles. Citations from the Engineering Index data base
[PB80-808074] N80-27299
The development of the zepplin dirigible for long distance transportation
[NASA-TM-76143] N80-27303
Measures for improving the zeppelin airships for long distance transportation
[NASA-TM-76142] N80-27351
PATHOGENESIS
Biochemical bases of pathogenesis of hypokinesia N80-27995
Role of dynamic space flight factors in the pathogenesis of involution of lymphatic organs (experimental morphological study) N80-28022
PATHOLOGICAL EFFECTS
Cardiovascular and respiratory physiopathological aspects of hypokinesia
[NASA-TM-76198] N80-28048
PATHOLOGY
Vertebral pain in helicopter pilots
[NASA-TM-75792] N80-28043
PATTERN METHOD (FORECASTING)
Research on specific models for the occurrence of significant earthquakes in Europe N80-27888
PATTERN RECOGNITION
Generalized Approach to New Problems in Ultrasonic Inspection (GANPUI)
[AD-A083931] N80-27709
Label Identification from Statistical Tabulation (LIST)
[E80-10132] N80-27764
On the accuracy of pixel relaxation labeling
[E80-10185] N80-27765
Analysis of scanner data for crop inventories --- Brazil and Argentina
[E80-10191] N80-27767
Region representation: Quadtree-to-raster conversion
[AD-A084288] N80-28112
Computing the Euler number of image from its quadtree
[AD-A084289] N80-28113
A distance transform for images represented by quadtrees
[AD-A084290] N80-28114
Shape segmentation using relaxation, 2
[AD-A084292] N80-28116
Region representation: Quadtrees from binary arrays
[AD-A084287] N80-28117
PATTERN REGISTRATION
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
PAVEMENTS
Road rater and Benkelman beam pavement deflections
[PB80-158439] N80-27530
Performance of open-graded friction courses
[PB80-162985] N80-27531
Frictional resistance of pavements
[PB80-162662] N80-27537
Patching flexible and rigid pavements
[PB80-161243] N80-27541
Flexible pavement deflection equation using elastic moduli and field measurements
[PB80-159247] N80-27542
PAYLOADS
Retrieval techniques: LVLH and inertially stabilized payloads
[NASA-TM-81099] N80-27416
PEARSON DISTRIBUTIONS
An anomaly in the Pearson product-moment correlation coefficient
[AD-A084354] N80-28136
PERFORMANCE PREDICTION
CF6-6D engine performance deterioration
[NASA-CR-159786] N80-27364
Mathematical modelling of gas-turbine combustion chambers N80-27374
A prediction model for turbulent diffusion flames including NO-formation N80-27375
On the prediction of temperature profiles at the exit of annular combustors N80-27377
Survey on prediction procedures for the calculation of furnace performance --- heat transfer models N80-27387
Numerical analysis and experimental data in a continuous flow combustion chamber: A comparison N80-27388
Modeling furnances fed with oxygen-enriched air N80-27389
Fuel property effects on combustor performance
[AD-A084017] N80-27511
Performance prediction from a computer hardware description
[AD-A083842] N80-28058
Performance ripple effect analysis for large-scale software maintenance
[AD-A084351] N80-28076
PERFORMANCE TESTS
ATARS/ATC simulation tests with site adaptation logic in the Philadelphia terminal area
[AD-A083718] N80-27308
Tests of an ATCRBS based trilateration sensor at Logan International Airport
[AD-A078979] N80-27316
Performance, emissions, and physical characteristics of a rotating combustion aircraft engine, supplement A
[NASA-CR-135119] N80-27361
Orbiter S-band direct link system verification test report
[NASA-TM-81110] N80-27414
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
A multiple pulse CO2 tea laser for use in thermal blooming studies
[AD-A083930] N80-27687
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700
Current conduction mechanism and design optimization study of MIS solar cells N80-27796
Small passenger car transmission test-Chevrolet 200 transmission
[NASA-CR-159835] N80-28255
PERIODIC FUNCTIONS
Coincident bifurcation of equilibrium and periodic solutions of evolution equations
[AD-A083810] N80-28101
PERIODIC VARIATIONS
Forced oscillations of nonlinear Hamiltonian systems, 2
[AD-A083812] N80-28100
On the periodicities of Saturn's reflectivity in the visible N80-28282
PERMEABILITY
Magma migration --- applied to thermal evolution N80-27855
Displacement of plasma protein and conduction velocity in rats under action of acceleration forces and hypokinesia
[NASA-TM-76195] N80-27989

PERSONNEL MANAGEMENT
Response time, operator productivity and job satisfaction N80-28053
PERSONNEL SELECTION
Air traffic control automation: Its impact and use in the selection and screening of air traffic controllers N80-27329
PERTURBATION THEORY
Singularly perturbed equations in the critical case --- asymptotic expansions of solutions of boundary value problems
[AD-A083821] N80-28133
PESTICIDES
Characteristics of enzymatic induction provoked by chlordane
[NASA-TM-76194] N80-28047
PETROLOGY
Photometric properties of carbonaceous chondrites and related materials N80-28283
PH
The University of Oklahoma severe storms intercept project-1979
[PB80-166010] N80-27972
PHARMACOLOGY
Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981
Effect of central neurotropic substances on the hypophysisadrenal cortex system during immobilization of animals
[NASA-TM-76158] N80-27982
PHASE COHERENCE
Phase conjugate optics: On the theory, observation, and utilization of temporally-reversed wavefronts as generated via nonlinear optical parametric interactions N80-28178
PHASE DIAGRAMS
The phase diagram and magnetization of super fluid 3HE N80-28208
PHASE TRANSFORMATIONS
Beta decomposition in binary Ti-Cr alloys N80-27469
Convergent approximations in parabolic variationally inequalities. 1: One phase Stefan problems
[AD-A083814] N80-28105
PHENOLIC RESINS
Shape change of Galileo probe models in free-flight tests
[NASA-TM-81209] N80-27418
PHOSPHORUS
Future US phosphorus loadings to the Great Lakes: An integration of water quality management planning information
[PB80-160336] N80-27791
PHOTOCHEMICAL REACTIONS
Fundamental studies of the structure and chemistry of solid surfaces --- hydrazine decomposition
[AD-A083964] N80-27475
Photochemical consequences of interchromophoric interactions
[AD-A084712] N80-28173
PHOTOELASTIC ANALYSIS
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
PHOTOELECTRIC EMISSION
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27798
The determination of electronic states in crystalline semiconductors and metals by angle-resolved photoemission N80-28216
PHOTOELECTROCHEMICAL DEVICES
Investigation of cadmium selenide photoelectrochemical cells
[AD-A083690] N80-27815
PHOTOELECTRON SPECTROSCOPY
A multitechnique approach to surface studies of metals and alloys using X-ray photoelectron spectroscopy and secondary ion mass spectroscopy N80-27443
Conformation, electronic structure and reactivity as probed by photoelectron spectroscopy N80-27444
PHOTOGRAMMETRY
Statistical investigation of the propagation of random and non-random errors in block aerotriangulation systems N80-27763
Airborne laser topographic mapping results from initial joint NASA/US Army Corps of Engineers experiment
[NASA-TM-73287] N80-27782
Analytical plotters in Defense Mapping Agency
[AD-A083794] N80-27783
PHOTOINTERPRETATION
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
PHOTOMAPS
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
PHOTON BEAMS
Multiphoton dissociation of polyatomic molecules N80-28163
PHOTONS
Studies in the ionization of atoms and ions by photons N80-28162
Comptomization and radiation spectra of X-ray sources. Calculation of the Monte Carlo method
[NASA-TM-76181] N80-28193
PHOTOSPHERE
Coronal heating by stochastic magnetic pumping
[NASA-CR-163356] N80-28287
PHOTOSTRESSES
Experimental studies of excited metallic phases in stressed germanium N80-28205
PHOTOTHERMAL CONVERSION
Development of a low-cost non-tracking heat pipe concentrating collector
[PB80-160443] N80-27828
PHOTOVOLTAIC EFFECT
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27798
PHYSICAL EXERCISE
Circulation in exercising crew members of the first main expedition aboard Salyut-6 N80-27997
Evaluation of efficacy of the set of preventive measures referable to the human neuromuscular system under hypokinetic conditions N80-28007
Effects of ozone on exercising and sedentary adult men and women representative of the flight attendant population
[AD-A080045] N80-28049
PHYSICAL FITNESS
The relation between tilt table and acceleration-tolerance and their dependence on stature and physical fitness
[NASA-TM-75796] N80-28042
PHYSIOLOGICAL EFFECTS
Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981
Effect of central neurotropic substances on the hypophysisadrenal cortex system during immobilization of animals
[NASA-TM-76158] N80-27982
Oxygen consumption of animals under conditions of hypokinesia
[NASA-TM-76167] N80-27983
Mechanisms of water-salt metabolism disturbances in dogs subjected to six month hypokinesia
[NASA-TM-76170] N80-27984
Effect of immobilization on the EEG of the baboon. Comparison with telemetry results from unrestricted animals
[NASA-TM-76137] N80-27987
Calorigenic effect of adrenaline in rats under conditions of restricted motor activity
[NASA-TM-76192] N80-27988
Displacement of plasma protein and conduction velocity in rats under action of acceleration forces and hypokinesia
[NASA-TM-76195] N80-27989
Experimental coronary sclerosis induced by immobilization of rabbits: A new model of arteriosclerosis
[NASA-TM-76196] N80-27990
Effects of immobilization on spermiogenesis
[NASA-TM-76282] N80-27993
USSR Report: Space Biology and Aerospace Medicine, volume 14, no. 3, 1980
[JPRS-75956] N80-27994
USSR Report. Space Biology and Aerospace Medicine, volume 14, no.2, 1980
[JPRS-75654] N80-28015
Principal results of physiological experiments with mammals aboard the Cosmos-936 biosatellite N80-28020
Effect of hypokinesia on invertase activity of the mucosa of the small intestine
[NASA-TM-76191] N80-28039
Changes of the body functions during long-term hypokinesia
[NASA-TM-76166] N80-28041
The content of catecholamines in the adrenal glands and sections of the brain under hypokinesia and injection of some neurotropic agents
[NASA-TM-76010] N80-28044
Characteristics of enzymatic induction provoked by chlordane
[NASA-TM-76194] N80-28047
Cardiovascular and respiratory physiopathological aspects of hypokinesia
[NASA-TM-76198] N80-28048
Effects of ozone on exercising and sedentary adult men and women representative of the flight attendant population
[AD-A080045] N80-28049
Altitude hypoxia. Citations from the NTIS data base
[PB80-807696] N80-28052
PHYSIOLOGICAL TESTS
Method for assessing hemodynamics and detecting latent insufficiency of cerebral circulation in cosmonaut candidates N80-28012
Ultrasonic method of recording gas bubbles in animal venous blood in a rarefied atmosphere N80-28013
The relation between tilt table and acceleration-tolerance and their dependence on stature and physical fitness
[NASA-TM-75796] N80-28042
PIEZOELECTRICITY
Piezoelectricity in nylon 11
[AD-A083719] N80-27609
PILOT PERFORMANCE
General aviation pilot and aircraft activity survey, conducted in 1978
[AD-A081726] N80-27276
The 1976 accident experience of civilian pilots with static physical defects
[AD-A077189] N80-27304
Effect of prolonged +Gz accelerations on human performance N80-28003
PILOT PLANTS
A test plan for the NEPSCO coal-oil mixture combustion project N80-27505
Recommended health and safety guidelines for coal gasification pilot plants
[PB80-164890] N80-27536
PILOT SELECTION
Method for assessing hemodynamics and detecting latent insufficiency of cerebral circulation in cosmonaut candidates N80-28012
PIPE FLOW
Report on pumping characteristic tests and piping pressure loss measurement tests for fine COM N80-27507
Experimental study of coherent structures in the turbulent boundary layer of pipe flow using laser-Doppler anemometry N80-27650
PIPELINES
Hydrogen compatibility of structural materials for energy storage and transmission
[SAND-80-8202] N80-27820
PLANAR STRUCTURES
Force balancing machines and optimization of dynamic relations for planar mechanisms N80-27693
PLANETARY ATMOSPHERES
Light scattering in a spherical planetary atmospheres, with applications to Venus N80-28284
PLANETARY EVOLUTION
Problems and strategy of the first flight to the comets
[NASA-TM-76241] N80-27402
PLANTS (BOTANY)
Study of compatibility of certain higher plants and chlorella as related to a bioregenerative human life support system N80-28033
PLASMA ACCELERATION
Accurate analytic approximations and numerical solutions for the structure of quasi-static laser driven ablation layers
[AD-A083913] N80-28200

PLASMA CLOUDS
Radiation coupled dynamics of ram confined radio sources N80-27551
A power model for plasma convection --- f region scenarios
[AD-A084653] N80-28203
PLASMA COMPRESSION
Axial and radial compression of ion beams
[AD-A083702] N80-28171
PLASMA CONTROL
Equilibrium and stability in strongly inhomogeneous plasmas --- confinement schemes including field-reversed mirrors and tokamak sheaths
N80-28188
PLASMA DENSITY
A power model for plasma convection --- f region scenarios
[AD-A084653] N80-28203
PLASMA DIAGNOSTICS
Saturated atomic fluorescence as a diagnostic tool for flames and plasmas N80-27439
Production and investigation of a multi-amphere positron source N80-28189
PLASMA EQUILIBRIUM
The equilibrium and compression of ion rings
N80-28185
PLASMA HEATING
Reflection of oblique electron thermal modes in an inhomogenous plasma
[IPPJ-457] N80-28192
PLASMA INTERACTIONS
Instabilities of a magnetized plasma driven by a velocity ring or a density gradient N80-28186
PLASMA JETS
Control of physical agent hazards of arc welding and cutting
[PB80-164866] N80-27705
PLASMA LAYERS
Accurate analytic approximations and numerical solutions for the structure of quasi-static laser driven ablation layers
[AD-A083913] N80-28200
PLASMA PHYSICS
Project group for laser research
[LA-TR-79-46] N80-27691
A study of the general plasma characteristics of a high power, multifilament ion source N80-28187
Heat transport due to the collisionless tearing instabilities
[IPPJ-461] N80-28197
Steady state magnetic diffusion from resistive interchange modes
[AD-A083915] N80-28199
PLASMA WAVES
Instabilities of a magnetized plasma driven by a velocity ring or a density gradient N80-28186
Nonlinear wave evoluation in Vlasov plasma. A Lie transform N80-28190
PLASMA-ELECTROMAGNETIC INTERACTION
Experimental investigation of the anomalous skin effect and computer simulation of the collisionless interchange instability N80-28184
PLASMAS (PHYSICS)
Low-energy plasma in the dayside auroral zone
N80-27861
Nonlinear wave evoluation in Vlasov plasma. A Lie transform N80-28190
PLASTIC DEFORMATION
Plastic deformation and ductile fracture at an angle slit in a sheet under tension
[AD-A084564] N80-27728
PLASTIC PROPERTIES
The strength and plastic properties of dilute copper-titanium alloy single crystals N80-27470
PLATE THEORY
Geoid anomalies in the vicinity of subduction zones
[NASA-TM-80678] N80-27732
PLATING
The effect of ion plating and ion implantation on the cyclic response and fatigue crack initiation of metals and alloys
[AD-A083643] N80-27478
PLOTTERS
Analytical plotters in Defense Mapping Agency
[AD-A083794] N80-27783
PLUMES
Space shuttle main engine plume radiation model
[NASA-CR-161498] N80-27415
POINT SOURCES
A review of standards of performance for new stationary sources: Secondary lead smelters
[PB80-154065] N80-27851
POINTS (MATHEMATICS)
A point mapping study of dynamical systems
N80-28140
POISSON DENSITY FUNCTIONS
A note on the generation of Poisson-distributed random numbers with large mean
[E80-10224] N80-27773
POLAR REGIONS
ULF/LF reflectivity of the polar ionosphere
[AD-A083240] N80-27901
POLARIZATION (WAVES)
Electromagnetic scattering patterns from sinusoidal surfaces: Vertical polarization
[AD-A083919] N80-27560
POLICIES
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793
POLLUTION CONTROL
Noise levels near streets, effectiveness and cost abatement measures
[NASA-TM-75814] N80-27834
Federal Aviation Administration high altitude pollution program, second biennial report, prepared in accordance with the Ozone Protection provision, section 153g, of the Clean Air Act Amendments of 1977
[AD-A081520] N80-27841
Transportation air quality analysis - sketch planning methods. Volume 2: Case studies
[PB80-158710] N80-27845
Functional polymers for removal of heavy-metal Pollutants from water
[PB80-158215] N80-27846
Control of Particulate Emissions in the Primary Nonferrous Metals Industries --- conference
[PB80-151822] N80-27847
Characterization of priority pollutants from an airplane parts manufacturing facility
[PB80-151566] N80-27848
Study of New England utilities' particulate air pollution control facilities to determine relative viability of approaches to upgrade and retrofit
[PB80-154073] N80-27849
A review of standards of performance for new stationary sources: Secondary lead smelters
[PB80-154065] N80-27851
POLLUTION MONITORING
Coordinated aircraft and ship surveys for determining impact of river inputs on great lakes waters. Remote sensing results
[NASA-TP-1694] N80-27832
DRAFT recommended practice for measurement of gaseous and particulate emissions from heavy-duty diesel engines under transient conditions
[PB80-153943] N80-27844
Characterization of priority pollutants from an airplane parts manufacturing facility
[PB80-151566] N80-27848
POLYATOMIC MOLECULES
Multiphoton dissociation of polyatomic molecules
N80-28163
POLYBUTADIENE
Tear strength and tensile strength of model filled elastomers
[AD-A083168] N80-27485
POLYIMIDES
Feasibility of Kevlar 49/PMR-15 polyimide for high temperature applications
[NASA-TM-81560] N80-27429
POLYMER CHEMISTRY
The biosynthesis of natural rubber and other hydrocarbon polymers N80-27482
Heat stable polymers: Polyquinolines and other aromatic polymers
[AD-A083129] N80-27489
Hydrogen production using solid-polymer-electrolyte technology for water electrolysis and hybrid sulfur cycle
[EPRI-EM-1185] N80-27518
POLYMER PHYSICS
A study of the nature and origins of pyroelectricity in polyvinylidenefluoride and its co-polymers
[AD-A084448] N80-27490
POLYMERS
Shape change of Galileo probe models in free-flight tests
[NASA-TM-81209] N80-27418
Fluoroalkyleneether silicate/viton GLT blends for hydraulic system seals: Synthesis, blending, and testing
[AD-A084708] N80-27701
Solid polymer electrolyte fuel cell technology program
[NASA-CR-160734] N80-27801
System of hygienic inspection of nonmetal materials used in spacecraft equipment N80-28032
POLYURETHANE FOAM
Use of polyurethane foam deformation sensor to record respiratory activity N80-28036
POLYURETHANE RESINS
Investigation of application parameters and testing of rain erosion coatings
[AD-A083578] N80-27430
POLYVINYL CHLORIDE
Toxicity of vinyl chloride. Citations from the NTIS data base
[PB80-807662] N80-28051
PONDS
The development of PALIS: A Ponds and Lakes Information System for Massachusetts
[PB80-156979] N80-27786
POPULATION INVERSION
Computer program for the kinetics and populations in a xenon fluoride laser
[AD-A084459] N80-27630
POPULATIONS
Sample size determinations for some reliability problems N80-27706
POROSITY
Magma migration --- applied to thermal evolution
N80-27855
POROUS MATERIALS
The boundary integral equation method applied to free surface flow problems in porous media
N80-27762
POSITION (LOCATION)
The Kloppenheim satellite observation station: Determination of longitude, latitude, and astronomical azimuth with the passage instrument ap 70
N80-28293
POSITIONING DEVICES (MACHINERY)
Release mechanism for releasing and reattaching experiments on the Space Shuttle
[NASA-TP-1702] N80-27694
POSITRON ANNIHILATION
Production and investigation of a multi-amphere positron source N80-28189
POSITRONS
Moisture determination in composite materials using positron lifetime techniques
[NASA-TP-1681] N80-27428
POWER AMPLIFIERS
IC Ku-Band impatt amplifier --- solid state spacecraft transmitter
[NASA-CR-160004] N80-27601
POWER EFFICIENCY
Effect on combined cycle efficiency of stack gas temperature constraints to avoid acid corrosion
[NASA-TM-81531] N80-27804
POWER SPECTRA
An investigation of the low-frequency sound field of a reverberant enclosure and the effects of digital electronic feedback N80-28149
POWER SUPPLY CIRCUITS
The 140 GHz pulsed impatt combiner high power source
[AD-A083450] N80-27606
PRECIPITATION (METEOROLOGY)
Probability forecasting: Reasons, procedures, problems
[PB80-164353] N80-27969
PRECIPITATION HARDENING
Iron-based alloys strengthened by ternary Laves phases --- precipitation hardening
[PB80-157233] N80-27480
PREDICTION ANALYSIS TECHNIQUES
A numerical and experimental study of the turbulent wakes of turbomachinery rotor blades, isolated airfoils, and a cascade of airfoils N80-27277

Loran-C signal analysis
[AD-A084239] N80-27321
Development and verification of radiation models
N80-27380
Survey on prediction procedures for the calculation of furnace performance --- heat transfer models
N80-27387
Analysis of life prediction methods for time-dependent fatigue crack initiation in nickel-base superalloys
[PB80-158116] N80-27481
Use of petroleum-based correlations and estimation methods for synthetic fuels
[NASA-TM-81533] N80-27509
Computer prediction of large reflector antenna radiation properties
[NASA-CR-163253] N80-27556
Stresses and deformations in elliptical contacts
[NASA-TM-81535] N80-27697
Fully flooded elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81543] N80-27698
Starved elastohydrodynamic lubricated elliptical contacts
[NASA-TM-81549] N80-27699
Atmospheric models --- data requirements
N80-27740
ASHMET: A computer code for estimating insolation incident on tilted surfaces
[NASA-TM-78286] N80-27807
European earthquake prediction program --- conference proceedings, Strasbourg, 31 Jan. - 1 Feb. 1980
[ESA-SP-156] N80-27874
A brief summary of a proposed program for earthquake prediction and the study of plate dynamics in southwest Europe N80-27875
Proposed program for earthquake prediction in southern Spain --- and study of the influence of large plate motions N80-27876
Investigation of precursors around the Azores archipelago and the seismogenetic capacity of that area: Models of the earthquake process along the boundary between the African and Eurasian plates, affecting the Portuguese territory N80-27877
In situ measurements of constraints to be made in Greece N80-27882
A first European joint effort in earthquake prediction research N80-27884
Earthquake prediction research for the northern Anatolian fault zone (Turkey) N80-27885
An outline proposal of some aims, strategies and objectives --- in earthquake prediction N80-27886
Research on specific models for the occurrence of significant earthquakes in Europe N80-27888
Future aspects of earthquake prediction research
N80-27889
Approach to sounding on the VAS processor
[NASA-TM-80713] N80-28056
Shuttle program. Solar activity prediction of sunspot numbers, predicted solar radio flux
[NASA-TM-81109] N80-28286

PREDICTIONS
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona --- Picacho Basin
[PB80-159908] N80-27788

PRESSURE BREATHING
Respiration and gas exchange under hyperbaric conditions N80-28016

PRESSURE DISTRIBUTION
Transonic small disturbances equation applied to the solution of two-dimensional nonsteady flows
[NASA-TM-75795] N80-27279
Documentation of cascade unsteady pressure difference program
[AD-A083987] N80-27368
Combustor modelling for scramjet engines
N80-27379
Structural and acoustic response of submerged shells of revolution N80-27718
An investigation of wind loads on solar collectors. Appendix 2: Net pressure coefficients
[PB80-158769] N80-27829

PRESSURE GAGES
Capillary flowmeters for a accurate, stable flows of gases
[AD-A083874] N80-27677

PRESSURE GRADIENTS
Report on pumping characteristic tests and piping pressure loss measurement tests for fine COM
N80-27507

PRESSURE MEASUREMENTS
Report on pumping characteristic tests and piping pressure loss measurement tests for fine COM
N80-27507

PRESTRESSING
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels N80-27717

PRINTED CIRCUITS
Printed circuits. Citations from the Engineering Index data base
[PB80-807571] N80-27614
Printed circuits. Citations from the NTIS data base
[PB80-807563] N80-27615

PROBABILITY DENSITY FUNCTIONS
Second-order closure modeling of turbulent mixing and reacting flows N80-27378
A turbulence closure of the transport equation for the probability density of velocity N80-27662
Generalizing the iterative proportional fitting procedure
[AD-A084429] N80-28118

PROBABILITY DISTRIBUTION FUNCTIONS
Probabilities of vertical overlap: A sensitivity analysis --- vertical separation standards for aircraft
[PB80-161151] N80-27323
Extreme value theory for continuous parameter stationary processes
[AD-A083802] N80-28103
On probability distributions involving the Stirling numbers N80-28130

PROBABILITY THEORY
Probability transforms of digital pictures
[AD-A084286] N80-28071
Contingency tables
[AD-A084262] N80-28134
Statistical methods in sole source contract negotiation
[AD-A083983] N80-28227

PROBE METHOD (FORECASTING)
Investigation of precursors around the Azores archipelago and the seismogenetic capacity of that area: Models of the earthquake process along the boundary between the African and Eurasian plates, affecting the Portuguese territory N80-27877
Proposal for an earthquake prediction project in northern Greece N80-27881

PROBLEM SOLVING
Numerical methods for inverse transient heat conduction problems N80-27624
The application of regression methods to the initial transient problem in computer simulations
N80-28067
The Electric Simulator Program (ESP) usage guide
[AD-A084676] N80-28075
Using parallel processing for problem solving
[AD-A084638] N80-28093
Collocation methods for elliptic partial differential equations N80-28094
Computer calculation of mechanisms involving intermittent motions
[AD-A083809] N80-28098
Generalized network approaches for solving least absolute value and Tchebycheff regression problems
[AD-A084284] N80-28121
Direct elliptic equation solvers with low memory requirements
[AD-A084557] N80-28123
Representation of physics knowledge by experts and novices
[AD-A084452] N80-28148

PROCESS CONTROL (INDUSTRY)
Coal/oil/water mixture stability, appendix A
N80-27502
Rapid ethanol production via fermentation
[LBL-10219] N80-27519
Investigation into adaptive control of a slip-cast, reaction-bonded silicon-nitride process via adaptive learning network modeling
[AD-A083730] N80-28091
Programmable assembly research technology transfer to industry, phase 2
[PB80-164809] N80-28261

PRODUCT DEVELOPMENT
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9909] N80-27521
Process development studies on the bioconversion of cellulose and production of ethanol
[LBL-9220] N80-27522
Solid polymer electrolyte fuel cell technology program
[NASA-CR-160734] N80-27801
Phase 1 of the near term hybrid passenger vehicle development program, appendix A. Mission analysis and performance specification studies. Volume 2: Appendices
[NASA-CR-163221] N80-28247
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies, volume 1
[NASA-CR-163222] N80-28248
Phase 1 of the near term hybrid passenger vehicle development program. Appendix C: Preliminary design data package, volume 1
[NASA-CR-163223] N80-28249
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies. Volume 2: Appendices
[NASA-CR-163224] N80-28250
Phase 1 of the near term hybrid passenger vehicle development program. Appendix C: Preliminary design data package. Volume 2: Appendices
[NASA-CR-163225] N80-28251
Phase 1 of the near term hybrid passenger vehicle development program. Appendix D: Sensitivity analysis
[NASA-CR-163226] N80-28252

PRODUCTION ENGINEERING
Screen printing technology applied to silicon solar cell fabrication
[NASA-CR-159789] N80-27808
Response time, operator productivity and job satisfaction N80-28053

PRODUCTION MANAGEMENT
Costs and benefits of requiring new production of older aircraft types to meet amended noise standards
[AD-A080130] N80-27356

PROGRAMMING LANGUAGES
A software design system N80-28065
Program checking N80-28066
Programming language facilities for numerical computation
[AD-A083815] N80-28069

PROJECT MANAGEMENT
Technical and operational factors concerning the licensing and introduction of a new microwave landing system for category 2 N80-27336

PROJECT PLANNING
A brief summary of a proposed program for earthquake prediction and the study of plate dynamics in southwest Europe N80-27875
Proposed program for earthquake prediction in southern Spain --- and study of the influence of large plate motions N80-27876
Project for seismogenetic research in the Calabrais arc N80-27880
Proposal for an earthquake prediction project in northern Greece N80-27881
Earthquake prediction research for the northern Anatolian fault zone (Turkey) N80-27885
An outline proposal of some aims, strategies and objectives --- in earthquake prediction N80-27886
Seismotectonic evaluation of Europe, excluding the Balkans N80-27887

PROJECTILES
Dynamics of a liquid-filled gyroscope: Up-date of theory and experiment
[AD-A083886] N80-27676

PROJECTION
Evaluation of projection algorithms
[PB80-163702] N80-28081

PROPAGATION VELOCITY
Correlations of seismic velocity with depth in southern California
[PB80-164080] N80-27906

PROPELLERS
Influence of noise reduction on weight and cost of general aviation propellers
[AD-A082120] N80-27366

PROPULSION SYSTEM PERFORMANCE
Preliminary results of steady state characterization of near term electric vehicle breadboard propulsion system
[NASA-TM-81546] N80-28254
PROPULSIVE EFFICIENCY
Biological and aerodynamic problems with the flight of animals
[NASA-TM-75337] N80-27985
PROTECTIVE COATINGS
Investigation of application parameters and testing of rain erosion coatings
[AD-A083578] N80-27430
PROTEIN METABOLISM
Characteristics of enzymatic induction provoked by chlordane
[NASA-TM-76194] N80-28047
PROTEINS
A computer graphics system for macromolecular model building N80-28068
PSEUDONOISE
Correction procedures for aircraft noise data. Volume 1: Pseudotones
[AD-A081962] N80-28157
PSYCHOPHYSIOLOGY
Effect of psychotropic drugs on gastric ulcers induced by immobilization: Increased protective effect of amitriptyline caused by chlordiazepoxide
[NASA-TM-76197] N80-27991
PUBLIC HEALTH
Recommended health and safety guidelines for coal gasification pilot plants
[PB80-164890] N80-27536
PULMONARY CIRCULATION
Theoretical analysis of the effect of state of pulmonary circulation on distribution of ventilation-perfusion relations and gas exchange in the lungs N80-28011
PULMONARY FUNCTIONS
Measurement of lung function using magnetometers. 1: Principles and mathematical modeling
[AD-A083910] N80-28038
PULSE COMMUNICATION
Enhanced UK teletext moves towards still pictures
[BBC-RD-1980/4] N80-27545
Theoretical feasibility of digital communication over ocean areas by high frequency radio
[AD-A079424] N80-27568
PULSE GENERATORS
The 140 GHz pulsed impatt combiner high power source
[AD-A083450] N80-27606
PULSE RADAR
The NOAA SEL HF radar system (ionospheric sounder)
[PB80-160989] N80-27905
PULSED LASERS
Computer modeling of pulsed chemical lasers
[AD-A083648] N80-27686
PUMPS
Report on pumping characteristic tests and piping pressure loss measurement tests for fine COM N80-27507
PYROELECTRICITY
Composite pyroeletric materials
[AD-A083726] N80-27434
A study of the nature and origins of pyroelectricity in polyvinylidenefluoride and its co-polymers
[AD-A084448] N80-27490

Q

QUALITY CONTROL
Standardization in France
[PB80-162126] N80-27539
Multicharacteristic quality control: A survey
[AD-A083894] N80-27708
Computer science and technology: Validation verification, and testing for the individual programmer
[PB80-166960] N80-28061
QUANTITATIVE ANALYSIS
An investigation of the empirical calibration method in quantitative secondary ion N80-27449
Quantitative secondary ion mass spectrometric analysis using ion implanation N80-27450
QUANTUM MECHANICS
Multiphoton processes in isolated atoms and molecules N80-28164
A mathematical study of the non-relativistic limit in quantum mechanics N80-28226
QUASARS
New method for determining the distances to certain extragalactic radio sources
[NASA-TM-76209] N80-28280
The X-ray spectrum of QSO 0241+622 --- OSO-8 observations
[NASA-TM-80645] N80-28289
QUATERNIONS
Quaternion utilization in a missile model
[AD-A084263] N80-27358
QUENCHING (COOLING)
Ignition, combustion, detonation, and quenching of reactive mixtures
[AD-A083737] N80-27456
QUEUEING THEORY
Computer networks: A martingale approach N80-28083
Time-varying queues requiring secondary service mechanisms for primary servers N80-28085
Approximate solutions of queueing network models of computer systems N80-28086
Variance reduction techniques for the simulation of queueing networks N80-28088
On homogeneity and on-line-off-line behavior in M/G/1 queueing systems
[AD-A083827] N80-28090
QUINOLINE
Heat stable polymers: Polyquinolines and other aromatic polymers
[AD-A083129] N80-27489

R

RADAR
Quiet radar processor analysis by covariance matrix transformations
[AD-A084453] N80-27585
RADAR ANTENNAS
Adaptive techniques for large space apertures
[AD-A084631] N80-27581
RADAR BEACONS
Tests of an ATCRBS based trilateration sensor at Logan International Airport
[AD-A078979] N80-27316
Very lightweight air traffic management system using an electronic scan antenna N80-27335
RADAR CROSS SECTIONS
Intermediate results of the radar backscatter study of sea ice in the Beaufort Sea
[AD-A083644] N80-27563
RADAR DETECTION
SAR object changes detection study
[AD-A084630] N80-27582
RADAR ECHOES
Spectra from 50 MHz auroral radar echoes N80-27547
Gradient scattering theory demonstrates that VHF, spread-F radar backscatter reveals streaming instabilities
[AD-A084644] N80-27571
RADAR EQUIPMENT
Introduction on LORADS and ASDE N80-27340
ADSEL: Selective address SSR, performance of the evaluation station --- air traffic control N80-27345
RADAR SCANNING
Comparison of an alpha-beta and kalman filter in track while scan radars
[AD-A084464] N80-27578
RADAR SCATTERING
Intermediate results of the radar backscatter study of sea ice in the Beaufort Sea
[AD-A083644] N80-27563
RADAR SIGNATURES
Resonances of radar targets and target discrimination
[AD-A083680] N80-27564
RADAR TARGETS
Resonances of radar targets and target discrimination
[AD-A083680] N80-27564
RADIAL FLOW
Loss model for off-design performance analysis of radial turbines with pivoting-vane, variable-area stators
[NASA-TM-81532] N80-27365
High-temperature radial turbine demonstration
[AD-A084120] N80-27370
RADIAL VELOCITY
Axial and radial compression of ion beams
[AD-A083702] N80-28171
RADIANT FLUX DENSITY
Development and verification of radiation models N80-27380
Radiation balance and radiation processes N80-27735
A comparison of radiative transfer models for predicting the microwave emission from soils
[NASA-TM-80888] N80-27777
RADIATION ABSORPTION
An analytical study of wave propagation through foliage
[AD-A084348] N80-27587
RADIATION DISTRIBUTION
Studies in the ionization of atoms and ions by photons N80-28162
RADIATION EFFECTS
The effects of high level infrasound
[AD-A081792] N80-28159
Determination of morphology and electronic structure in solids with 20-1000 eV radiation N80-28206
RADIATION HARDENING
Cost/benefit analysis of reentry vehicle hardness testing using the FAST methodology. Volume 2: Methods
[AD-A083336] N80-27420
Development of test structures for characterization of the fabrication and performance of radiation-hardened Charge-Coupled Device (CCD) imagers
[PB80-160708] N80-27613
RADIATION HAZARDS
Control of physical agent hazards of arc welding and cutting
[PB80-164866] N80-27705
RADIATION MEASUREMENT
Sampling problems and radiation budgets: Data requirements N80-27746
Cosmic Rays. Citations from the NTIS data base
[PB80-807647] N80-28291
RADIATION PROTECTION
Control of physical agent hazards of arc welding and cutting
[PB80-164866] N80-27705
RADIATION SOURCES
Laser-produced plasmas and radiation sources
[AD-A084201] N80-28202
RADIATIVE HEAT TRANSFER
Development and verification of radiation models N80-27380
Space shuttle main engine plume radiation model
[NASA-CR-161496] N80-27415
Radiative transfer in the cloudy and dusty atmosphere N80-27743
Zonal and seasonal radiative effects of a doubling of atmospheric carbon dioxide concentration --- heating of the surface and troposphere N80-27952
RADIATIVE TRANSFER
A computer program for thermal radiation from gaseous rocket exhaust plumes (GASRAD)
[NASA-CR-161496] N80-27423
A cylindrical cloud model for microwave and infrared radiative transfer-applications to defense meteorological satellite program microwave sounders N80-27912
RADIO ALTIMETERS
The development and test of a tactical self-contained landing system --- landing military helicopters when the safe corridor is unknown N80-27334
Satellite altimetry measurements of the sea surface N80-27748
RADIO ASTRONOMY
New method for determining the distances to certain extragalactic radio sources
[NASA-TM-76209] N80-28280
Synoptic observations of Jupiter's radio emissions: Average Statistical properties observed by Voyager
[NASA-TM-80717] N80-28285
RADIO COMMUNICATION
On the spatial capacity of packet radio networks N80-27549
Communication application of adaptive arrays
[AD-A084402] N80-27576

RADIO DIRECTION FINDERS
HF direction finding by waterfront testing
[AD-A084549] N80-27584
RADIO EMISSION
Synoptic observations of Jupiter's radio emissions: Average Statistical properties observed by Voyager
[NASA-TM-80717] N80-28285
RADIO EQUIPMENT
Development of an automated Remote Communications Air-Ground (RCAG) monitoring system
[AD-A083754] N80-27567
Theoretical feasibility of digital communication over ocean areas by high frequency radio
[AD-A079424] N80-27568
RADIO FREQUENCIES
HF (High-Frequency) radio noise in the topside ionosphere
[PB80-162670] N80-27591
RADIO FREQUENCY HEATING
Reflection of oblique electron thermal modes in an inhomogenous plasma
[IPPJ-457] N80-28192
RADIO FREQUENCY INTERFERENCE
High power HF and noise cancellation system
[AD-A084016] N80-27562
RADIO RELAY SYSTEMS
Feasibility study for the teletransmission of data from geophysical network installed in a seismic area to an operational center N80-27878
RADIO WAVES
Development of a small rocket system for conductivity measurements in the high latitude disturbed D-region in support of ELF/VLF propagation studies
[AD-A083331] N80-27897
Resonant interaction of solitons and Zakharov-Shabat theory
[IPPJ-456] N80-28194
RADIOACTIVE WASTES
Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175
RADIOMETERS
Adaptive techniques for large space apertures
[AD-A084631] N80-27581
The GSFC Mark-2 three band hand-held radiometer --- thematic mapper for ground truth data collection
[NASA-TM-80641] N80-27874
RADIOSONDES
Approach to sounding on the VAS processor
[NASA-TM-80713] N80-28056
RADOMES
Broadband metallic radome
[AD-A084663] N80-27574
RAIL TRANSPORTATION
Description and technical review of the Duke University automated people/cargo transportation system
[PB80-159734] N80-28256
Aerial surveys, geometrics, surface drainage, ecological impacts and safety appurtenances
[PB80-162233] N80-28257
RAIN
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
Numerical simulation of hurricanes using radar and satellite-derived rainfall N80-27910
RAIN EROSION
Investigation of application parameters and testing of rain erosion coatings
[AD-A083576] N80-27430
RAINDROPS
Liquid impact erosion mechanisms in transparent materials
[AD-A084267] N80-27491
RAM
Radiation coupled dynamics of ram confined radio sources N80-27551
RAMAN SPECTRA
Raman scattering studies of solid-phase species --- diagnosing spacecraft contaminants
[AD-A083926] N80-27459
Flow field measurement using Raman and LDV techniques
[AD-A083767] N80-27635
Wavefront reproduction by stimulated Brillouin and Raman scattering N80-27885
Visible laser research one meter device
[AD-A084196] N80-27688
RAMAN SPECTROSCOPY
Conceptual design study for Coherent Anti-Stokes Raman Spectroscopy (CARS) diagnostics in the AMMRC ballistic compressor facility
[AD-A083492] N80-27453
RAMJET ENGINES
Carbon slurry fuels for volume limited missiles
[AD-A084710] N80-27512
RANDOM PROCESSES
Stochastic integration, Markov property and measure transformation of random fields N80-27598
RANDOM VARIABLES
Dependent relevations
[AD-A084543] N80-28119
Maximum likelihood estimation of the survival functions of stochastically ordered random variables
[AD-A083903] N80-28132
A general mixture-truncation method for generating bivariate random variables from univariate generators
[AD-A084474] N80-28138
Random coverage of a circle with application to a shadowing problem
[AD-A084357] N80-28130
RANGELANDS
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
RAPID TRANSIT SYSTEMS
Description and technical review of the Duke University automated people/cargo transportation system
[PB80-159734] N80-28256
RARE EARTH ELEMENTS
Materials research for advanced inertial instrumentation. Task 3: Rare earth magnetic material technology as related to gyro torquers and motors
[AD-A083968] N80-27679
RARE GASES
Inert gas ion thruster development
[NASA-CR-159805] N80-27424
RAWINSONDES
A preliminary look at AVE-SESAME 2 conducted on 19-20 April 1979
[NASA-TM-78280] N80-27916
REACTION KINETICS
Turbulent reaction and transport phenomena in jet flames N80-27376
Chemical kinetic modelling for combustion application N80-27383
A chemical reactor model and its application to a practical combustor N80-27392
The fate and behavior of fuel-sulfur in combustion systems N80-27422
The kinetics and mechanism of the formation of ozone by the anodic oxidation of water N80-27445
Reaction pathways for electrochemically generated radical anions N80-27447
Shock tube studies of the N2O/CH4/CO/Ar systems
[AD-A083722] N80-27455
Computational approaches to the study of reactive flow mixing
[AD-A083912] N80-27457
The sulfidation behavior of nickel-chromium, nickel-aluminum, and nickel-chromium-aluminum alloys with and without yttrium N80-27456
Combustion of coal-oil mixtures in a 700 HP watertube boiler N80-27504
An experimental investigation of reactive, turbulent, recirculating jet mixing
[AD-A084546] N80-27642
Computer program for the kinetics and populations in a xenon fluoride laser
[AD-A084459] N80-27690
Inelastic collisions of excited atoms
[AD-A084524] N80-28172
Photochemical consequences of interchromophoric interactions
[AD-A084712] N80-28173
Crossed molecular beam study of the reactions of oxygen and fluorine atoms
[AD-A084255] N80-28174
REACTOR DESIGN
Surface study of fusion research in universities linkage organization
[IPPJ-455] N80-28196
RECEIVERS
Evolution and transition of today's military landing system to compatibility with present and future civil military systems --- multimode receivers and the marine remote area approach landing system N80-27339
A 346 GHz heterodyne receiver and its use in observations of carbon monoxide in interstellar clouds N80-28268
RECONSTRUCTION
Three-dimensional turbulent boundary layer: Restructuration of an axisymetric flow subjected to a discontinuity of the wall peripheral velocity N80-27696
RECTANGULAR PLATES
Large deflection and large-amplitude free vibrations of laminated composite-material plates
[AD-A084070] N80-27436
RECURSIVE FUNCTIONS
The independence of control structures in abstract programming systems N80-28084
Application of linear prediction to multiclass sequential discrimination
[AD-A084272] N80-28124
Recursive estimation in time series models N80-28131
REDUCED GRAVITY
Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403
REDUCTION
Experiments in the determination of seismic wave absorption N80-27894
REDUCTION (CHEMISTRY)
Reaction pathways for electrochemically generated radical anions N80-27447
REENTRY VEHICLES
Cost/benefit analysis of reentry vehicle hardness testing using the FAST methodology. Volume 2: Methods
[AD-A083336] N80-27430
REFLECTANCE
On the periodicities of Saturn's reflectivity in the visible N80-28262
REFLECTED WAVES
Reflection of oblique electron thermal modes in an inhomogenous plasma
[IPPJ-457] N80-28192
REFLECTORS
Focal axis resolver for offset reflector antennas
[NASA-TM-80683] N80-27555
Computer prediction of large reflector antenna radiation properties
[NASA-CR-163253] N80-27556
REFRACTIVITY
Measurement of strongly refracting, three-dimensional index distributions N80-28176
REGRESSION ANALYSIS
Snowpack monitoring in North America and Eurasia using passive microwave satellite data
[NASA-TM-80706] N80-27779
A study of the Sequential Regression (SER) algorithm and its applications N80-28063
The application of regression methods to the initial transient problem in computer simulations N80-28067
Generalized network approaches for solving least absolute value and Tchebycheff regression problems
[AD-A084284] N80-28121
A prediction interval for a first order Gaussian Markov process
[AD-A084094] N80-28137
REINFORCEMENT (STRUCTURES)
Optimum inelastic design of seismic-resistant reinforced concrete frame structures
[PB80-164636] N80-27532
Hysteric behavior of reinforced concrete structural walls
[PB80-165905] N80-27533
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels N80-27717
RELATIVISTIC PARTICLES
Radiation coupled dynamics of ram confined radio sources N80-27551
RELATIVISTIC PLASMAS
The equilibrium and compression of ion rings N80-28185
RELAXATION METHOD (MATHEMATICS)
On the accuracy of pixel relaxation labeling
[E80-10185] N80-27765

RELAY SATELLITES
Applications of satellite data relay to problems of field seismology
[NASA-TM-80673] N80-27871
RELEASING
Release mechanism for releasing and reattaching experiments on the Space Shuttle
[NASA-TP-1702] N80-27894
RELIABILITY
Sample size determinations for some reliability problems N80-27708
An investigation of a statistical procedure for monitoring two-sample life tests
[AD-A084041] N80-27710
Computer-oriented methods for assessing reliability of complex systems N80-27980
RELIABILITY ANALYSIS
Graphical techniques in reliability theory
N80-27707
Serviceability and reliability analysis of partially prestressed concrete beams N80-27715
Determination of astronomical coordinates at the Kloppenheim satellite observation station using the circumzenithal astrolabe VUGTK; for the period 1972 to 1975 N80-28204
RELIABILITY ENGINEERING
In-service improvements to reliability and maintainability of the instrument landing system
[AD-A075586] N80-27312
Characteristic for a moderate accuracy Inertial Navigation System (INS)
[AD-A084036] N80-27318
REMOTE CONTROL
Release mechanism for releasing and reattaching experiments on the Space Shuttle
[NASA-TP-1702] N80-27894
REMOTE REGIONS
Assessment of the environmental compatibility of differing helicopter noise certification standards
[AD-A080525] N80-28153
REMOTE SENSORS
Intermediate results of the radar backscatter study of sea ice in the Beaufort Sea
[AD-A083644] N80-27563
Large Antenna Multifrequency Microwave Radiometer (LAMMR) system design
[NASA-TM-80685] N80-27675
The High Visible Resolution (HVR) instrument of the spot ground observation satellite
[NASA-TM-75830] N80-27781
Remote measurements of air pollutants
[PB80-164791] N80-27852
RENAL FUNCTION
Effect of weightlessness and artificial gravity on ion-regulating function of rat kidneys N80-27999
Morphometric analysis of glomerules and juxtaglomerula system of the rat kidney in the course of experimental hypokinesia N80-28028
REPEATERS
High capacity low delay packet broadcasting multiaccess schemes for satellite repeater systems
N80-27546
REPLENISHMENT
Gas replenishment techniques for use in high-altitude, long-duration scientific balloon flights
[AD-A084480] N80-27297
REPRODUCTION (BIOLOGY)
Effect of conditioning for hypoxia on fertility of white mice N80-28030
RESEARCH AND DEVELOPMENT
NASA authorization, 1981, volume 4
[GPO-61-147] N80-28243
Systems for stimulating the development of fundamental research
[PB80-162316] N80-28259
RESEARCH MANAGEMENT
Experimental methods and techniques in turbulent boundary layer research N80-27546
Systems for stimulating the development of fundamental research
[PB80-162316] N80-28259
RESIDUAL STRESS
Determination of residual stress by magnetomechanical acoustic emission
[AD-A084065] N80-27479
X-Ray techniques for the measurement of residual stresses in the real world
[AD-A083796] N80-27711
RESILIENCE
Tire stiffness and damping determined from static and free-vibration tests — aircraft tires
[NASA-TP-1871] N80-27302
RESISTORS
Particle size effects on electrical properties of thick film resistors N80-27596
RESONANCE
Resonant interaction of solitons and Zakharov-Shabat theory
[IPPJ-496] N80-28194
Interaction of ion-acoustic solitons in two-dimensional space
[IPPJ-459] N80-28199
RESONANCE SCATTERING
Resonant interaction of solitons and Zakharov-Shabat theory
[IPPJ-496] N80-28194
Interaction of ion-acoustic solitons in two-dimensional space
[IPPJ-459] N80-28199
RESONANT FREQUENCIES
Theoretical studies of microstrip antennas. Volume 2: Analysis and synthesis of multi-frequency elements
[AD-A075540] N80-27569
Bending stress and frequency calculations for the bearing-pack shaft — drills
[SAND-80-7030] N80-27729
Investigation of amplitude and frequency in seismic reflections: Study of the absorption of reflected seismic studies N80-27893
RESOURCES MANAGEMENT
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
RESPIRATORY PHYSIOLOGY
Dynamics of human external respiration and blood gases under the combined effect of hypercapnia and hypoxia N80-28024
RESPIRATORY RATE
Use of polyurethane foam deformation sensor to record respiratory activity N80-28036
RESPIRATORY SYSTEM
Respiration and gas exchange under hyperbaric conditions N80-28016
Cardiovascular and respiratory physiopathological aspects of hypokinesia
[NASA-TM-76198] N80-28046
RESPONSE TIME (COMPUTERS)
The optimization of query processing on distributed database systems N80-28087
REVERBERATION
An investigation of the low-frequency sound field of a reverberant enclosure and the effects of digital electronic feedback N80-28149
REVERSE FIELD PINCH
Current-carrying plasma in ferromak
[IPPJ-468] N80-28191
REVERSE OSMOSIS
Upgrading efficacy of membrane techniques for regenerating water from urine N80-28035
REVOLVING
Structural and acoustic response of submerged shells of revolution N80-27716
REYNOLDS NUMBER
Effect of Reynolds number on stability characteristics of a cruciform wind-body
[NASA-TP-1682] N80-27283
Experimental studies of scale effects on oscillating airfoils at transonic speeds
[NASA-TM-81216] N80-27287
Separation effects in gas-particle flows at high Reynolds numbers N80-27622
REYNOLDS STRESS
Reynolds stress closures: Status and prospects
N80-27980
RIGID STRUCTURES
Optimum inelastic design of seismic-resistant reinforced concrete frame structures
[PB80-164635] N80-27532
Inelastic analysis and design of cold-formed steel beams with stiffened compression flanges
N80-27715
RING CURRENTS
Instabilities of a magnetized plasma driven by a velocity ring or a density gradient N80-28198
RING STRUCTURES
Instructions for the use of the CIVM-Jet 4C finite-strain computer code to calculate the transient structural responses of partial and/or complete arbitrarily-curved rings subjected to fragment impact
[NASA-CR-158873] N80-27720
RISK
Determination of the safety in a North Atlantic organized track system with reduced lateral separation — statistical tests N80-27332
RIVER BASINS
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787
Inventory of snow cover and sea ice data — Northern and Southern Hemispheres
[PB80-164007] N80-27794
ROBOTS
Programmable assembly research technology transfer to industry, phase 2
[PB80-164809] N80-28251
ROCKET EXHAUST
A computer program for thermal radiation from gaseous rocket exhaust plumes (GASRAD)
[NASA-CR-161496] N80-27423
Multicolor inversion diagnostic for tactical motor plumes
[AD-A083904] N80-27428
ROCKET SOUNDING
Rocket borne composition measurements of the lower thermosphere with a new type of instrumentation: Auroral secondary electron energy spectra measured with a new form of cylindrical analyzer N80-27985
ROCKET-BORNE INSTRUMENTS
Rocket borne composition measurements of the lower thermosphere with a new type of instrumentation: Auroral secondary electron energy spectra measured with a new form of cylindrical analyzer N80-27985
Development of a small rocket system for conductivity measurements in the high latitude disturbed D-region in support of ELF/VLF propagation studies
[AD-A083331] N80-27997
Rocket studies of solar corona and transition region — X-Ray spectrometer/spectrograph telescope
[NASA-CR-160001] N80-28298
ROCKS
Sonar probing as a mining and tunneling tool
[PB80-159239] N80-27790
ROLLER BEARINGS
Stresses and deformations in elliptical contacts
[NASA-TM-81536] N80-27697
ROTARY STABILITY
The response of turbine engine rotors to interference rubs
[NASA-TM-81518] N80-27696
ROTARY WINGS
Effect of some structural parameters on elastic rotor loads by an iterative harmonic balance N80-27348
ROTATING BODIES
An attitude acquisition technique for dual-spin spacecraft — spacecraft rotor alignment
N80-27417
ROTATING DISKS
Heat and mass transfer from a rotating disk with phase change N80-27625
ROTOR BLADES (TURBOMACHINERY)
A numerical and experimental study of the turbulent wakes of turbomachinery rotor blades, isolated airfoils, and a cascade of airfoils N80-27277
Nature of rotor turbulence and strut flow disturbances and their effect on turbomachinery noise
[AD-A084355] N80-27369
The response of turbine engine rotors to interference rubs
[NASA-TM-81518] N80-27696
Feasibility study of aileron and spoiler control systems for large horizontal axis wind turbines
[NASA-CR-159856] N80-27803
ROTOR SPEED
Study of cost/benefit tradeoffs available in helicopter noise technology applications
[AD-A083955] N80-27354
ROTORS
Coupled bending-torsion flutter in cascades with applications to fan and compressor blades
N80-27386

RUBBER
The biosynthesis of natural rubber and other hydrocarbon polymers N80-27482
RUBIDIUM
X-ray absorption studies of graphite intercalates and metal-ammonia solutions — arsenic fluorocomplexes and rubidium-ammonia N80-28213
RUNWAY LIGHTS
Study of optical techniques for indirect generation of runway approach lights
[AD-A080434] N80-27399

S

S WAVES
Investigation of a seismic model using a three layer model N80-27995
SAFETY FACTORS
Recommended health and safety guidelines for coal gasification pilot plants
[PB80-164890] N80-27536
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-166389] N80-28202
SAFETY MANAGEMENT
Precision navigation for air traffic management
[AD-A082847] N80-27317
Criteria for a recommended standard: Occupational exposures in coal gasification plants
[PB80-164874] N80-27535
Fire-resistant hydraulic fluid safety
[PB80-159488] N80-27544
SALIVETY
Mechanisms of water-salt metabolism disturbances in dogs subjected to six month hypokinesia
[NASA-TM-76170] N80-27984
SALT BEDS
Investigation of heat storages with salt hydrate as storage medium based on the extra water principle
[EUR-6646-PT-2] N80-27818
Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175
SANDWICH STRUCTURES
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27799
SATELLITE INSTRUMENTS
The High Visible Resolution (HVR) instrument of the spot ground observation satellite
[NASA-TM-75930] N80-27791
SATELLITE NAVIGATION SYSTEMS
Precision navigation for air traffic management N80-27342
SATELLITE OBSERVATION
Climate and climate modeling N80-27734
Satellite altimetry measurements of the sea surface N80-27748
Ozone monitoring from space N80-27752
Mountain overflow phenomena in satellite imagery N80-27754
Meteorological research and cloud parameter derivation from satellite data N80-27755
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757
Global wind determination by interferometric techniques in the troposphere stratosphere and mesosphere N80-27759
Ocean circulation — validating models with altimeter and wind data from satellites N80-27760
SATELLITE PERTURBATION
An analytical integration of the averaged equations of variation due to sun-moon perturbations and its application
[AD-A083231] N80-28291
SATELLITE POWER TRANSMISSION (TO EARTH)
Satellite Power Systems(SPS): Concept development and evaluation program, preliminary assessment
[DOE/ER-0041] N80-27404
Solar power satellite system definition study. Volume 1: Executive summary, phase 3
[NASA-CR-160742] N80-27809
Solar power satellite system definition study. Volume 2, part 3: Final briefing, 16 May 1980, phase 3
[NASA-CR-160743] N80-27810
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
Solar power satellite system definition study. Volume 4: Solid states SPS Analysis, phase 3
[NASA-CR-160745] N80-27812
Solar power satellite system definition study. Volume 5: Space transportation analysis, phase 3
[NASA-CR-160746] N80-27813
SATELLITE SOUNDING
On Climatology, Hydrology, Atmospheric Research and Meteorology (CHARM) from Space — conference proceedings, Ajaccio, France, 12-16 Nov. 1979
[ESA-SP-150] N80-27733
Radiation balance and radiation processes N80-27735
The Earth's hydrosphere and cryosphere — role of ocean circulation in models of climatic changes with emphasis on ocean surface temperature N80-27736
Meteorological research — optimization of processing techniques applied to satellite sounding data N80-27738
Space techniques — for measuring meteorological parameters N80-27739
Satellite measurements of atmospheric temperature N80-27749
Composition of the middle atmosphere: Status and priorities — for research using satellites N80-27751
Water vapor in the upper troposphere and in the stratosphere — satellite observation N80-27753
Methods and problems in satellite temperature profiles and winds — vertical temperature and wind profiles N80-27756
A cylindrical cloud model for microwave and infrared radiative transfer-applications to defense meteorological satellite program microwave sounders N80-27912
SATELLITE TRACKING
Satellite and missile data generation for AIS
[AD-A084326] N80-28143
SATELLITE TRANSMISSION
Applications of satellite data relay to problems of field seismology
[NASA-TM-80673] N80-27871
SATELLITE-BORNE INSTRUMENTS
Space techniques — for measuring meteorological parameters N80-27739
Assessment of atmospheric height uncertainties for high precision satellite altimeter missions to monitor ocean currents
[NASA-CR-156868] N80-27873
SATURN (PLANET)
On the periodicities of Saturn's reflectivity in the visible N80-28282
SCALE EFFECT
Experimental studies of scale effects on oscillating airfoils at transonic speeds
[NASA-TM-81216] N80-27287
SCALE MODELS
Shape change of Galileo probe models in free-flight tests
[NASA-TM-81209] N80-27418
SCATTERING FUNCTIONS
Electromagnetic scattering by surfaces of arbitrary shape
[AD-A084347] N80-27580
SCAVENGING
A numerical investigation of the efficiency with which aerosol particles collide with cloud and small rain drops N80-27831
SCHOTTKY DIODES
IC Ku-Band impatt amplifier — solid state spacecraft transmitter
[NASA-CR-160004] N80-27601
Optical studies of the interface states at GaAs-metal Schottky barrier junctions
[AD-A082758] N80-28220
SCHULER TUNING
Accuracy of aircraft velocities from inertial navigation systems for application to airborne wind measurements
[NASA-TM-81826] N80-27913
SCINTILLATION
Statistical behavior of signals from the wideband signal
[AD-A084646] N80-27572
SEA ICE
Intermediate results of the radar backscatter study of sea ice in the Beaufort Sea
[AD-A083644] N80-27563
Ice sheets, glaciers, and climate N80-27742
Inventory of snow cover and sea ice data — Northern and Southern Hemispheres
[PB80-164007] N80-27794
General circulation model experiments using glacial period and related boundary conditions N80-27934
SEA STATES
Satellite altimetry measurements of the sea surface N80-27748
SEA TRUTH
Satellite altimetry measurements of the sea surface N80-27748
SEA WATER
Adsorption of trace metals by hydrous ferric oxide in sea water
[PB80-152804] N80-27463
SEALERS
Preformed elastomeric joint sealers for bridges. Phase 2: Executive summary report
[PB80-162845] N80-27540
Fluoroalkyleneether silicate/viton GLT blends for hydraulic system seals: Synthesis, blending, and testing
[AD-A084708] N80-27701
SEALS (STOPPERS)
Dynamic analysis of noncontacting face seals
[NASA-TM-79294] N80-27695
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700
SEAMS (JOINTS)
Preformed elastomeric joint sealers for bridges. Phase 2: Executive summary report
[PB80-162845] N80-27540
SEAWEEDS
Biosources Digest, a journal on biomass utilization, volume 1, no. 2 — ocean farming
[PB80-157662] N80-27795
SECONDARY FLOW
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632
SECONDARY RADAR
Very lightweight air traffic management system using an electronic scan antenna N80-27335
ADSEL: Selective address SSR, performance of the evaluation station — air traffic control N80-27345
Surveillance performance measurements of the SSR mode of the discrete address beacon system N80-27346
SEDIMENT TRANSPORT
A model of a suspended sediment induced, stably stratified oceanic bottom boundary layer N80-27974
SEDIMENTARY ROCKS
The paleomagnetism of the Carboniferous strata in the northern Appalachian basin with applications toward magnetostratigraphy N80-27856
SEDIMENTS
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy — Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
SEISMIC WAVES
Investigation of wave frequency at different travel times — applications to seismic prospecting
[BMFT-FB-T-79-77] N80-27892
Investigation of amplitude and frequency in seismic reflections: Study of the absorption of reflected seismic studies N80-27893
Experiments in the determination of seismic wave absorption N80-27894
Correlations of seismic velocity with depth in southern California
[PB80-164060] N80-27906
SEISMOGRAMS
Investigation of wave frequency at different travel times — applications to seismic prospecting
[BMFT-FB-T-79-77] N80-27892

SEISMOLOGY
Applications of satellite data relay to problems of field seismology
[NASA-TM-80673] N80-27871
Project for seismogenetic research in the Calabrais arc N80-27880
Seismotectonic evaluation of Europe, excluding the Balkans N80-27887
The European-Mediterranean Seismological Centre (EMSC) N80-27891
SELF ERECTING DEVICES
Space Construction Automated Fabrication Experiment Definition Study (SCAFEDS), part 3. Volume 3: Requirements
[NASA-CR-160747] N80-27399
SEMICIRCULAR CANALS
Semicircular canal function in rats after flight aboard the Cosmos-936 biosatellite N80-28021
SEMICONDUCTOR DEVICES
Manufacturing methods and technology measure for fabrication of silicon transcalent rectifier
[AD-A083122] N80-27605
Heterojunction solar cells
[SERI/TP-32-134] N80-27822
An experiment concept to measure stratospheric trace constituents by laser heterodyne spectroscopy N80-27869
SEMICONDUCTOR JUNCTIONS
Non-linear junction characterization
[AD-A083898] N80-27602
Noncoplanar high power FET
[AD-A083682] N80-27607
Optical studies of the interface states at GaAs-metal Schottky barrier junctions
[AD-A083758] N80-28220
SEMICONDUCTORS (MATERIALS)
The homogeneous machine N80-27593
Semiconductor measurment technology: Modulation measurements for microwave mixers
[PB80-166952] N80-27618
Surveys of high-pressure effects in solids
[AD-A083728] N80-27722
The determination of electronic states in crystalline semiconductors and metals by angle-resolved photoemission N80-28216
Interactions in solids N80-28218
SEPARATED FLOW
Separation effects in gas-particle flows at high Reynolds numbers N80-27622
Colloquim on flow separation
[AD-A083741] N80-27636
SEQUENTIAL ANALYSIS
Application of linear prediction to multiclass sequential discrimination
[AD-A084272] N80-28124
SEQUENTIAL CONTROL
A study of the Sequential Regression (SER) algorithm and its applications N80-28063
SERVICES
Time-varying queues requiring secondary service mechanisms for primary servers N80-28085
SERVOCONTROL
Programmable assembly research technology transfer to industry, phase 2
[PB80-164809] N80-28261
SET THEORY
Contingent derivatives of set-valued maps and solutions to nonlinear inclusions and differential inclusions
[AD-A083826] N80-28108
SHAFTS (MACHINE ELEMENTS)
Bending stress and frequency calculations for the bearing-pack shaft --- drills
[SAND-80-7030] N80-27729
SHALE OIL
Use of petroleum-based correlations and estimation methods for synthetic fuels
[NASA-TM-81533] N80-27509
SHAPES
The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419
SHEAR FLOW
Coherent structures in time dependent shear flows N80-27652
SHEAR STRESS
Development and application of a computational shear band model
[AD-A084029] N80-27721
SHELLS (STRUCTURAL FORMS)
Cylindrical shells of bimodulus composite material
[AD-A083974] N80-27432
Structural and acoustic response of submerged shells of revolution N80-27718
SHOCK WAVE INTERACTION
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction
[AD-A083703] N80-27639
SHOCK WAVES
Turbulence behavior in a shock wave/boundary layer interaction N80-27655
SHORT TAKEOFF AIRCRAFT
Computation of the turbulent mixing in curved ejectors --- V/STOL aircraft
[AD-A083905] N80-27634
SHROUDED TURBINES
Composite wall concept for high temperature turbine shrouds: Heat transfer analysis
[NASA-TM-81539] N80-27362
The response of turbine engine rotors to interference rubs
[NASA-TM-81518] N80-27696
SIGNAL ANALYSIS
Loran-C signal analysis
[AD-A084239] N80-27321
SIGNAL PROCESSING
Background monitor for the SATCOM signal analyzer
[AD-A084361] N80-27579
Quiet radar processor analysis by covariance matrix transformations
[AD-A084453] N80-27585
A study of real time signal processing methods for decoding spread spectrum systems
[AD-A084349] N80-27588
SIGNAL TO NOISE RATIOS
Correction procedures for aircraft noise data. Volume 1: Pseudotones
[AD-A081962] N80-28157
Correction procedures for aircraft noise data. Volume 2: Background noise considerations
[AD-A082011] N80-28158
SIGNATURE ANALYSIS
Analysis of scanner data for crop inventories --- Brazil and Argentina
[E80-10191] N80-27767
SILICON
Screen printing technology applied to silicon solar cell fabrication
[NASA-CR-159789] N80-27808
Amorphous thin films for solar cell application
[DOE/ET-23040-3] N80-27819
SILICON CARBIDES
Effect of CVD tungsten and IaC coatings on the mechanical behavior of SiC(C)
[AD-A083395] N80-27488
SILICON CONTROLLED RECTIFIERS
Manufacturing methods and technology measure for fabrication of silicon transcalent rectifier
[AD-A083122] N80-27605
SILICON NITRIDES
Effect of W and WC on the oxidation resistance of yttria-doped silicon nitride
[NASA-TM-81528] N80-27483
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N48w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484
Investigation into adaptive control of a slip-cast, reaction-bonded silicon-nitride process via adaptive learning network modeling
[AD-A083730] N80-28091
SIMULATION
Current conduction mechanism and design optimization study of MIS solar cells N80-27796
SINGLE CRYSTALS
The strength and plastic properties of dilute copper-titanium alloy single crystals N80-27470
SLABS
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543
SLOT ANTENNAS
Theoretical studies of microstrip antennas. Volume 2: Analysis and synthesis of multi-frequency elements
[AD-A075540] N80-27569
SLURRIES
Hydrolyzed wood slurry flow modeling --- hydrocarbon fuel production
[LBL-10090] N80-27703
SLURRY PROPELLANTS
Carbon slurry fuels for volume limited missiles
[AD-A084710] N80-27512
SMELTING
A review of standards of performance for new stationary sources: Secondary lead smelters
[PB80-154065] N80-27851
SNOW COVER
Snowpack monitoring in North America and Eurasia using passive microwave satellite data
[NASA-TM-80706] N80-27779
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794
SOCIOLOGY
Systems for stimulating the development of fundamental research
[PB80-162316] N80-28259
SOIL MECHANICS
Doubly-asymptotic, boundary-element analysis of nonlinear soil structure interaction
[AD-A083330] N80-27529
SOIL MOISTURE
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
A comparison of radiative transfer models for predicting the microwave emission from soils
[NASA-TM-80666] N80-27777
Remote sensing of soil moisture content over bare fields at 1.4 GHz frequency
[NASA-TM-80711] N80-27780
SOLAR ACTIVITY
Shuttle program. Solar activity prediction of sunspot numbers, predicted solar radio flux
[NASA-TM-81109] N80-28286
SOLAR CELLS
Current conduction mechanism and design optimization study of MIS solar cells N80-27796
Screen printing technology applied to silicon solar cell fabrication
[NASA-CR-159789] N80-27808
Amorphous thin films for solar cell application
[DOE/ET-23040-3] N80-27819
Heterojunction solar cells
[SERI/TP-32-134] N80-27822
SOLAR COLLECTORS
Solar energy system performance evaluation-seasonal report for Elcam San Diego, San Diego, California
[NASA-CR-161481] N80-27806
ASHMET: A computer code for estimating insolation incident on tilted surfaces
[NASA-TM-78286] N80-27807
Development of a low-cost non-tracking heat pipe concentrating collector
[PB80-160443] N80-27828
An investigation of wind loads on solar collectors. Appendix 2: Net pressure coefficients
[PB80-158769] N80-27829
SOLAR CONSTANT
The solar constant and its spectrum --- relationship to Earth's climate N80-27745
SOLAR COOLING
Evaluation of a proposed ASTM (American Society for Testing and Materials) standard guide to assess the compatibility of metal-heat transfer liquid pairs in solar heating and cooling systems
[PB80-161748] N80-27826
SOLAR CORONA
Coronal heating by stochastic magnetic pumping
[NASA-CR-163356] N80-28287
Rocket studies of solar corona and transition region --- X-Ray spectrometer/spectrograph telescope
[NASA-CR-160001] N80-28288
SOLAR ECLIPSES
The influence of NO and ClO variations at twilight on the interpretation of solar occultation measurements N80-27868
SOLAR ENERGY
HYCSOS: Hydride conversion and storage system sensitivity analysis
[ANL/EES-TM-63] N80-27523
Analysis of code related responses from the solar demonstration program
[PB80-153968] N80-27827

SOLAR ENERGY CONVERSION
Solar heating system installed at Stamford, Connecticut
[NASA-CR-161436] N80-27800
Solar energy system performance evaluation: Seasonal report for Contemporary-Manchester, Manchester, New Hampshire
[NASA-CR-161471] N80-27802
Community impediments to implementation of solar energy
[DOE/EV-0059] N80-27821
Solar process heat. Citations from the NTIS data base
[PB80-807936] N80-27823
Land use and environmental impacts of decentralized solar energy use
[DOE/EV-0067] N80-27843
SOLAR FLARES
Coronal heating by stochastic magnetic pumping
[NASA-CR-163356] N80-28287
SOLAR GRAVITATION
An analytical integration of the averaged equations of variation due to sun-moon perturbations and its application
[AD-A083231] N80-28281
SOLAR HEATING
Investigation of heat storages with salt hydrate as storage medium based on the extra water principle
[EUR-6646-PT-2] N80-27818
Evaluation of a proposed ASTM (American Society for Testing and Materials) standard guide to assess the compatibility of metal-heat transfer liquid pairs in solar heating and cooling systems
[PB80-161748] N80-27826
SOLAR PHYSICS
A solar extreme ultraviolet telescope and spectrograph for space shuttle. Volume 1: Investigation and technical plan
[NASA-TM-80643] N80-28272
SOLAR POWER SATELLITES
Space construction system analysis study: Project systems and missions descriptions
[NASA-CR-160748] N80-27400
Satellite Power Systems(SPS): Concept development and evaluation program, preliminary assessment
[DOE/ER-0041] N80-27404
Solar power satellite system definition study. Volume 1: Executive summary, phase 3
[NASA-CR-160742] N80-27809
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
Solar power satellite system definition study. Volume 4: Solid states SPS Analysis, phase 3
[NASA-CR-160745] N80-27812
Solar power satellite system definition study. Volume 5: Space transportation analysis, phase 3
[NASA-CR-160746] N80-27813
SOLAR RADIATION
Radiation balance and radiation processes
N80-27735
SOLAR SPECTRA
The solar constant and its spectrum --- relationship to Earth's climate N80-27745
SOLAR SYSTEM
Problems and strategy of the first flight to the comets
[NASA-TM-78241] N80-27402
SOLID PHASES
Raman scattering studies of solid-phase species --- diagnosing spacecraft contaminants
[AD-A083926] N80-27459
SOLID PROPELLANT ROCKET ENGINES
Rocket research at Georgia Tech.
[AD-A083764] N80-27425
SOLID ROCKET PROPELLANTS
Rocket research at Georgia Tech.
[AD-A083764] N80-27425
SOLID STATE DEVICES
SSILS initial evaluation report. Davis-Monthan AFB, Arizona, 16-20 November 1979
[AD-A084635] N80-27320
Solar power satellite system definition study. Volume 4: Solid states SPS Analysis, phase 3
[NASA-CR-160745] N80-27812
SOLID STATE LASERS
Solar power satellite system definition study. Volume 2, part 3: Final briefing, 16 May 1980, phase 3
[NASA-CR-160743] N80-27810
SOLID SURFACES
Fundamental studies of the structure and chemistry of solid surfaces --- hydrazine decomposition
[AD-A083964] N80-27475
SOLITARY WAVES
Resonant interaction of solitons and Zakharov-Shabat theory
[IPPJ-456] N80-28194
Interaction of ion-acoustic solitons in two-dimensional space
[IPPJ-459] N80-28196
SONAR
Sonar probing as a mining and tunneling tool
[PB80-159239] N80-27790
SOOT
Fundamental characterization of alternative fuel effects in continuous combustion systems
N80-27382
SOUND FIELDS
An investigation of the low-frequency sound field of a reverberant enclosure and the effects of digital electronic feedback N80-28149
SOUND PROPAGATION
Surface waves and anomalous sound absorption
[AD-A083844] N80-28154
SOUND WAVES
Surface waves and anomalous sound absorption
[AD-A083844] N80-28154
SOUTH CAROLINA
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
SOUTHERN CALIFORNIA
Correlations of seismic velocity with depth in southern California
[PB80-164080] N80-27906
SOUTHERN HEMISPHERE
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794
SOYBEANS
Analysis of scanner data for crop inventories --- Brazil and Argentina
[E80-10191] N80-27767
SPACE ERECTABLE STRUCTURES
Space Construction Automated Fabrication Experiment Definition Study (SCAFEDS), part 3. Volume 3: Requirements
[NASA-CR-160747] N80-27399
Space construction system analysis study: Project systems and missions descriptions
[NASA-CR-160748] N80-27400
SPACE FLIGHT
Shuttle program. STS-7 conceptual flight profile. IUS/TDRS-A
[NASA-TM-81090] N80-27405
SPACE FLIGHT FEEDING
The question of using dehydrated foods during long-term space flights N80-28031
SPACE FLIGHT STRESS
USSR Report: Space Biology and Aerospace Medicine, volume 14, no. 3, 1980
[JPRS-75956] N80-27994
USSR Report. Space Biology and Aerospace Medicine, volume 14, no.2, 1980
[JPRS-75654] N80-28015
Role of dynamic space flight factors in the pathogenesis of involution of lymphatic organs (experimental morphological study) N80-28022
SPACE HEATING (BUILDINGS)
Mathematical modeling of boiler operations
N80-27391
Solar heating system installed at Stamford, Connecticut
[NASA-CR-161436] N80-27800
Solar energy system performance evaluation: Seasonal report for Contemporary-Manchester, Manchester, New Hampshire
[NASA-CR-161471] N80-27802
SPACE MANUFACTURING
Space Construction Automated Fabrication Experiment Definition Study (SCAFEDS), part 3. Volume 3: Requirements
[NASA-CR-160747] N80-27399
Space construction system analysis study: Project systems and missions descriptions
[NASA-CR-160748] N80-27400
SPACE MISSIONS
Problems and strategy of the first flight to the comets
[NASA-TM-78241] N80-27402
SPACE NAVIGATION
Shuttle program. Onorbit navigation integrator results for typical shuttle orbits
[NASA-TM-81092] N80-27407
SPACE OBSERVATIONS (FROM EARTH)
Low surface brightness spiral galaxies
N80-28264
SPACE PROCESSING
Processing of materials in space --- using the molecular shield and space shuttle
[ISRO-SN-04-78] N80-27401
SPACE PROGRAMS
Meteorological satellites
[NASA-TM-80704] N80-27914
SPACE SHUTTLE ORBITERS
Shuttle program. Onorbit navigation integrator results for typical shuttle orbits
[NASA-TM-81092] N80-27407
Shuttle program. MCC Level C formulation requirements: Entry guidance and entry autopilot
[NASA-TM-81093] N80-27408
Shuttle program. MCC level C formulation requirements: Shuttle TAEM guidance and flight control
[NASA-TM-81094] N80-27409
Shuttle program: OFT ascent/descent ancillary data requirements document
[NASA-TM-81095] N80-27410
SSV Generic OFT first stage ascent base convective heating environments
[NASA-CR-161499] N80-27630
Addendum to SSV generic OFT first stage ascent base convective heating environments
[NASA-CR-161497] N80-27631
SPACE SHUTTLE PAYLOADS
Release mechanism for releasing and reattaching experiments on the Space Shuttle
[NASA-TP-1702] N80-27694
A solar extreme ultraviolet telescope and spectrograph for space shuttle. Volume 1: Investigation and technical plan
[NASA-TM-80643] N80-28272
SPACE SHUTTLES
Space Construction Automated Fabrication Experiment Definition Study (SCAFEDS), part 3. Volume 3: Requirements
[NASA-CR-160747] N80-27399
Processing of materials in space --- using the molecular shield and space shuttle
[ISRO-SN-04-78] N80-27401
Space shuttle main engine plume radiation model
[NASA-CR-161498] N80-27415
SPACE STATIONS
Space construction system analysis study: Project systems and missions descriptions
[NASA-CR-160748] N80-27400
The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419
SPACE TRANSPORTATION
Solar power satellite system definition study. Volume 5: Space transportation analysis, phase 3
[NASA-CR-160746] N80-27813
SPACE TRANSPORTATION SYSTEM
Orbiter S-band direct link system verification test report
[NASA-TM-81110] N80-27414
SPACE TRANSPORTATION SYSTEM FLIGHTS
Shuttle program: OFT ascent/descent ancillary data requirements document
[NASA-TM-81095] N80-27410
SSV Generic OFT first stage ascent base convective heating environments
[NASA-CR-161499] N80-27630
Addendum to SSV generic OFT first stage ascent base convective heating environments
[NASA-CR-161497] N80-27631
SPACE TRANSPORTATION SYSTEM 1 FLIGHT
STS-1 operational flight profile. Volume 3: Ascent, cycle 3
[NASA-TM-81096] N80-27411

STS-1 operational flight profile. Volume 5: Descent, cycle 3. Appendix C: Monte Carlo dispersion analysis
[NASA-TM-81097] N80-27412
STS-1 operational flight profile. Volume 6: Abort analysis
[NASA-TM-81098] N80-27413

SPACE TRANSPORTATION SYSTEM 7 FLIGHT
Shuttle program. STS-7 conceptual flight profile. IUS/TDRS-A
[NASA-TM-81090] N80-27405
Shuttle program. STS-7 feasibility assessment: IUS/TDRS-A
[NASA-TM-81091] N80-27406

SPACEBORNE EXPERIMENTS
Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403
Results of an ISEE-1 experiment to study the interactions between energetic particles and discrete VLF waves in the magnetosphere
[NASA-CR-160006] N80-27421
Composition of the middle atmosphere: Status and priorities — for research using satellites N80-27751
Effect of weightlessness and artificial gravity on ion-regulating function of rat kidneys N80-27999
Activity of some hepatic enzymes and lipogenetic processes in rat alpose tissue after space flight — effects of weightlessness N80-28000
State of rat thyroid C cells following flights on the Cosmos type of biosatellites (according to results of a morphological study) — effects of weightlessness N80-28001
Research hardware and habitat of animals used in experiment aboard Cosmos-936 biosatellite N80-28019
Principal results of physiological experiments with mammals aboard the Cosmos-936 biosatellite N80-28020
Semicircular canal function in rats after flight aboard the Cosmos-936 biosatellite N80-28021

SPACECRAFT CABIN ATMOSPHERES
System of hygienic inspection of nonmetal materials used in spacecraft equipment N80-28032

SPACECRAFT COMMUNICATION
A microprocessor based high speed packet switch for satellite communications
[NASA-CR-163357] N80-27557
A microprocessor based high speed packet switch for satellite communications, executive summary
[NASA-CR-163357] N80-27558

SPACECRAFT CONTAMINATION
Raman scattering studies of solid-phase species — diagnosing spacecraft contaminants
[AD-A083626] N80-27459

SPACECRAFT RECOVERY
Retrieval techniques: LVLH and inertially stabilized payloads
[NASA-TM-81099] N80-27416

SPACECRAFT STRUCTURES
Space Construction Automated Fabrication Experiment Definition Study (SCAFEDS), part 3. Volume 3: Requirements
[NASA-CR-160747] N80-27399

SPACECRAFT TRAJECTORIES
The primer vector in linear, relative-motion equations — spacecraft trajectory optimization
[NASA-TM-81111] N80-28096

SPACELAB
Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403

SPACING
Probabilities of vertical overlap: A sensitivity analysis — vertical separation standards for aircraft
[PB80-161151] N80-27323

SPARK IGNITION
Semi-empirical correlations for gas turbine emissions, ignition, and flame stabilization N80-27393

SPECIFICATIONS
Characteristic for a moderate accuracy Inertial Navigation System (INS)
[AD-A084036] N80-27318
Phase 1 of the near term hybrid passenger vehicles development program. Appendix A: Mission analysis and performance specification studies, volume 1
[NASA-CR-163220] N80-28246
Phase 1 of the near term hybrid passenger vehicle development program, appendix A. Mission analysis and performance specification studies. Volume 2: Appendices
[NASA-CR-163221] N80-28247

SPECTRAL BANDS
Multicolor inversion diagnostic for tactical motor plumes
[AD-A083904] N80-27426

SPECTRAL REFLECTANCE
Photometric properties of carbonaceous chondrites and related materials N80-28283

SPECTRAL RESOLUTION
Climate simulations with spectral models of the atmosphere: Effect of spectral truncation N80-27921
A simulation of the January global circulation using a spectral model N80-27926

SPECTRAL SIGNATURES
Label Identification from Statistical Tabulation (LIST)
[E80-10132] N80-27784

SPECTROHELIOGRAPHS
Rocket studies of solar corona and transition region — X-Ray spectrometer/spectrograph telescope
[NASA-CR-160001] N80-28286

SPECTROPHOTOMETRY
Photometric properties of carbonaceous chondrites and related materials N80-28283

SPECTROSCOPIC ANALYSIS
Review of spectroscopic data for measurement of stratospheric species N80-27870

SPECTROSCOPIC TELESCOPES
A solar extreme ultraviolet telescope and spectrograph for space shuttle. Volume 1: Investigation and technical plan
[NASA-TM-80643] N80-28272

SPECTROSCOPY
Time-resolved spectroscopy using synchrotron radiation N80-27441
Project group for laser research
[LA-TR-79-48] N80-27691

SPECTRUM ANALYSIS
Background monitor for the SATCOM signal analyzer
[AD-A084381] N80-27579
Spectral analysis of GEOS-3 altimeter data and frequency domain collocation N80-27959
Modern empirical statistical spectral analysis
[AD-A084142] N80-28120

SPEECH
Information processing techniques program. Volume 1. Packet speech systems technology
[AD-A083195] N80-27559

SPERMATOGENESIS
Effects of immobilization on spermiogenesis
[NASA-TM-76282] N80-27990

SPHERICAL HARMONICS
The atmospheric general circulation model N80-27929

SPIRAL GALAXIES
Low surface brightness spiral galaxies N80-28264

SPLINE FUNCTIONS
Equilibria of the curvature functional and manifolds of nonlinear interpolating spline curves
[AD-A083807] N80-28108

SPOILERS
Feasibility study of aileron and spoiler control systems for large horizontal axis wind turbines
[NASA-CR-159856] N80-27803

SPREAD F
Nonlinear equatorial spread F: Spatially large bubbles resulting from large horizontal scale initial perturbations
[AD-A083393] N80-27900

SPREAD SPECTRUM TRANSMISSION
A study of real time signal processing methods for decoding spread spectrum systems
[AD-A084349] N80-27598

STABILIZED PLATFORMS
The dynamics and control of large flexible space structures, 3. Part A: Shape and orientation control of a platform in orbit using point actuators
[NASA-CR-163253] N80-27419

STANDARDIZATION
Standardization in France
[PB80-182126] N80-27539

STANDARDS
Standardization in France
[PB80-182126] N80-27539
Evaluation of a proposed ASTM (American Society for Testing and Materials) standard guide to assess the compatibility of metal-heat transfer liquid pairs in solar heating and cooling systems
[PB80-181748] N80-27826
Analysis of code related responses from the solar demonstration program
[PB80-153968] N80-27827
A review of standards of performance for new stationary sources: Secondary lead smelters
[PB80-154065] N80-27851
Assessment of the environmental compatibility of differing helicopter noise certification standards
[AD-A080525] N80-28153

STANDING WAVES
Magnetospheric pulsations: Model and observations of standing Alfven wave resonances N80-27546

STAR CLUSTERS
Star clusters containing massive, central black holes: Evolution calculations N80-28275

STAR DISTRIBUTION
The distribution of G5-K5 stars in a region at the South Galactic Pole N80-28276

STATIC TESTS
Tire stiffness and damping determined from static and free-vibration tests — aircraft tires
[NASA-TP-1671] N80-27302

STATISTICAL ANALYSIS
STS-1 operational flight profile. Volume 5: Descent, cycle 3. Appendix C: Monte Carlo dispersion analysis
[NASA-TM-81097] N80-27412
Construction and application of a questionnaire for the social scientific investigation of environmental noise effects
[NASA-TM-75492] N80-27835
Moving weighted average smoothing extended to the extremities of the data, revision
[AD-A083808] N80-28111
Contingency tables
[AD-A084262] N80-28134

STATISTICAL CORRELATION
Correlations of seismic velocity with depth in southern California
[PB80-164080] N80-27906

STATISTICAL DISTRIBUTIONS
An investigation of outlier definition and the impact of the masking phenomenon on several statistical outlier tests N80-28126
A Monte Carlo approach to the sampling error of estimates of the generalizability statistics from a two facet completely crossed generalizability study N80-28127
Statistical methods in sole source contract negotiation
[AD-A083983] N80-28227

STATISTICAL TESTS
Determination of the safety in a North Atlantic organized track system with reduced lateral separation — statistical tests N80-27332
An investigation of a statistical procedure for monitoring two-sample life tests
[AD-A084041] N80-27710
Statistical investigation of the propagation of random and non-random errors in block aerotriangulation systems N80-27763
Statistical assessments of sea temperature anomaly experiments — effects of sea surface temperature anomalies on the atmosphere N80-27931

STATISTICAL WEATHER FORECASTING
Probability forecasting: Reasons, procedures, problems
[PB80-154063] N80-27969

STATISTICS
Comments on the special issue of Communications in Statistics (Volume A8, No. 10) concerned with weather modification experiments
[AD-A083628] N80-27963

STATORS
The theory and effects of neglecting stator and network transients N80-27592

STEADY FLOW
An alternative approach to the numerical simulation
[NASA-TM-81542] N80-27286

STEADY STATE
Mathematical Theory of Laminar Combustion. Chapter 5: Unsteady burning of a linear condensate
[AD-A083738] N80-27458
Steady state magnetic diffusion from resistive interchange modes
[AD-A083915] N80-28199
STEEL STRUCTURES
Inelastic analysis and design of cold-formed steel beams with stiffened compression flanges
N80-27715
STEELS
The effects of non-carbide forming elements on the mechanical properties and microstructure of a secondary hardening steel N80-27465
STELLAR ENVELOPES
HI shells in the galaxy N80-28267
A neutral hydrogen survey of blue compact galaxies N80-28278
STELLAR EVOLUTION
Infrared studies of AFGL sources --- Air Force Geophysical Laboratory infrared catalog
[AD-A084713] N80-28274
Star clusters containing massive, central black holes: Evolution calculations N80-28275
A neutral hydrogen survey of blue compact galaxies N80-28278
Nature of type 1 Supernovae
[NASA-TM-76238] N80-28279
STELLAR LUMINOSITY
IUE observations of a luminous M supergiant that exhibits intense continuum in the far ultraviolet
[NASA-TM-80681] N80-28273
A neutral hydrogen survey of blue compact galaxies N80-28278
STELLAR MODELS
Star clusters containing massive, central black holes: Evolution calculations N80-28275
STELLAR SPECTRA
Observations of emission lines in M supergiants
[NASA-CR-163359] N80-28271
STELLAR SPECTROPHOTOMETRY
Stellar extreme ultraviolet spectroscopy
N80-28265
STELLARATORS
Current-carrying plasma in ferromak
[IPPJ-458] N80-28191
STENCIL PROCESSES
Screen printing technology applied to silicon solar cell fabrication
[NASA-CR-159789] N80-27808
STEREOSCOPY
Analytical plotters in Defense Mapping Agency
[AD-A083794] N80-27783
STIFFNESS
Tire stiffness and damping determined from static and free-vibration tests --- aircraft tires
[NASA-TP-1671] N80-27302
STOCHASTIC PROCESSES
Stochastic integration, Markov property and measure transformation of random fields
N80-27598
Stochastic processes in the atmosphere-ocean system --- and modeling sea surface temperature anomalies N80-27741
Optimizations of stochastic systems through simulation using stochastic approximation method
N80-28062
Extreme value theory for continuous parameter stationary processes
[AD-A083802] N80-28103
Sampling representations and approximations for certain functions and stochastic processes
N80-28128
Maximum likelihood estimation of the survival functions of stochastically ordered random variables
[AD-A083903] N80-28132
Optimal stationary linear control of the Wiener process
[AD-A084350] N80-28135
Algorithms for solving some undiscounted stochastic games N80-28142
Application of best linear unbiased prediction to interpolation of random fields and to network design
[AD-A083656] N80-28144
STOICHIOMETRY
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170
STOKES LAW (FLUID MECHANICS)
Reducing the error of geoid undulation computations by modifying Stokes' function
[NASA-CR-163316] N80-27872
STORAGE RINGS (PARTICLE ACCELERATORS)
Free electron lasers with variable parameter wigglers
[AD-A084323] N80-27689
STORAGE STABILITY
Design consideration of fine COM storage
N80-27506
STORAGE TANKS
The 2nd International Symposium on Coal-Oil Mixture Combustion, volume 1
[CONF-791160-VOL-1] N80-27494
Design consideration of fine COM storage
N80-27506
STORM DAMAGE
Red River Valley tornadoes of April 10, 1979. A report to the administrator
[PB80-165210] N80-27968
STORMS
Provide aircraft operation and analysis for SESAME-79 --- support for severe storms research
[PB80-165301] N80-27970
STORMS (METEOROLOGY)
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964
A field investigation of electric currents associated with severe local storms
[PB80-165632] N80-27971
STRAIN ENERGY METHODS
In situ measurements of constraints to be made in Greece N80-27882
STRAIN GAGES
Use of polyurethane foam deformation sensor to record respiratory activity N80-28036
STRATIGRAPHY
The paleomagnetism of the Carboniferous strata in the northern Appalachian basin with applications toward magnetostratigraphy N80-27856
Cambrian stratigraphy of the Libby Trough, Montana N80-27858
STRATOSPHERE
Atmospheric structure and composition --- stratosphere/troposphere interactions N80-27737
The interannual variability of the stratosphere
N80-27750
Composition of the middle atmosphere: Status and priorities --- for research using satellites N80-27751
Water vapor in the upper troposphere and in the stratosphere --- satellite observation N80-27753
Federal Aviation Administration high altitude pollution program, second biennial report, prepared in accordance with the Ozone Protection provision, section 153g, of the Clean Air Act Amendments of 1977
[AD-A081520] N80-27841
The kinetic energy climatology of tropospheric and lower stratospheric flow regimes associated with 500 MB intermediate and short waves over North America N80-27863
An experiment concept to measure stratospheric trace constituents by laser heterodyne spectroscopy
N80-27869
Review of spectroscopic data for measurement of stratospheric species N80-27870
STREAMS
Undeveloped hydropower as a potential energy source in Idaho
[PB80-157399] N80-27824
STRESS (PHYSIOLOGY)
Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981
Effect of central neurotropic substances on the hypophysisadrenal cortex system during immobilization of animals
[NASA-TM-76158] N80-27982
Oxygen consumption of animals under conditions of hypokinesia
[NASA-TM-76167] N80-27983
Mechanisms of water-salt metabolism disturbances in dogs subjected to six month hypokinesia
[NASA-TM-76170] N80-27984
Effect of immobilization on the EEG of the baboon. Comparison with telemetry results from unrestricted animals
[NASA-TM-76137] N80-27987
Calorigenic effect of adrenaline in rats under conditions of restricted motor activity
[NASA-TM-76192] N80-27988
Displacement of plasma protein and conduction velocity in rats under action of acceleration forces and hypokinesia
[NASA-TM-76195] N80-27989
Experimental coronary sclerosis induced by immobilization of rabbits: A new model of arteriosclerosis
[NASA-TM-76196] N80-27990
Effects of immobilization on spermiogenesis
[NASA-TM-76282] N80-27993
The stress reaction to hypokinesia and its effect on general resistance N80-28008
Effect of hypokinesia on invertase activity of the mucosa of the small intestine
[NASA-TM-76191] N80-28039
Morphofunctional correlations in the experimental study of myocardiopathies under the stress of forced restraint. Note 2: The influence of adrenal imbalance
[NASA-TM-76138] N80-28040
Changes of the body functions during long-term hypokinesia
[NASA-TM-76166] N80-28041
The content of catecholamines in the adrenal glands and sections of the brain under hypokinesia and injection of some neurotropic agents
[NASA-TM-76010] N80-28044
Mechanism of selective lesion of the cardiovascular system in paycho-emotional stress
[NASA-TM-76035] N80-28045
Characteristics of enzymatic induction provoked by chlordane
[NASA-TM-76194] N80-28047
Cardiovascular and respiratory physiopathological aspects of hypokinesia
[NASA-TM-76198] N80-28048
STRESS ANALYSIS
Stresses and deformations in elliptical contacts
[NASA-TM-81535] N80-27697
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels N80-27717
Instructions for the use of the CIVM-Jet 4C finite-strain computer code to calculate the transient structural responses of partial and/or complete arbitrarily-curved rings subjected to fragment impact
[NASA-CR-159873] N80-27720
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
A boundary layer theory for the anisotropic plate
[AD-A083265] N80-27726
Plastic deformation and ductile fracture at an angle slit in a sheet under tension
[AD-A084564] N80-27728
Bending stress and frequency calculations for the bearing-pack shaft --- drills
[SAND-80-7030] N80-27729
STRESS CORROSION
Stress crack phenomena. Citations from the NTIS data base
[PB80-807886] N80-27730
Stress crack phenomena. Citations from the NTIS data base
[PB80-807878] N80-27731
STRESS INTENSITY FACTORS
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083871] N80-27723
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
STRESS MEASUREMENT
X-Ray techniques for the measurement of residual stresses in the real world
[AD-A083796] N80-27711
Crustal stress and heat flow measurement in northern Anatolia N80-27883
STRESS WAVES
A unified numerical approach for thermally induced stress waves N80-27714

STRESS-STRAIN RELATIONSHIPS
Comparison of elastic and elastic-plastic structural analyses for cooled turbine blade airfoils
[NASA-TP-1679] N80-27719
Development and application of a computational shear band model
[AD-A084029] N80-27721
STRUCTURAL ANALYSIS
Flightworthy active control landing gear for a supersonic aircraft
[NASA-CR-3298] N80-27350
Performance of open-graded friction courses
[PB80-162985] N80-27531
Preformed elastomeric joint sealers for bridges. Phase 2: Executive summary report
[PB80-162645] N80-27540
Comparison of elastic and elastic-plastic structural analyses for cooled turbine blade airfoils
[NASA-TP-1679] N80-27719
Interactive nonlinear structural analysis. A review of the GIFTS-STAGS union
[AD-A084209] N80-28073
STRUCTURAL BASINS
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona --- Picacho Basin
[PB80-159908] N80-27788
STRUCTURAL DESIGN
The development of the zepplin dirigible for long distance transportation
[NASA-TM-76143] N80-27303
Multilevel optimum design of wing box structures with fiber composite panel components N80-27349
Measures for improving the zeppelin airships for long distance transportation
[NASA-TM-76142] N80-27351
Composite materials for structural design
[AD-A083721] N80-27433
An architecture for information systems management
[AD-A084545] N80-28238
STRUCTURAL DESIGN CRITERIA
Modeling the combustion chamber of a gas turbine: A mechanics viewpoint N80-27372
Inelastic seismic response of a torsionally unbalanced single-story building model
[PB80-164197] N80-27538
Analysis of code related responses from the solar demonstration program
[PB80-153968] N80-27827
STRUCTURAL PROPERTIES (GEOLOGY)
Investigation of a seismic model using a three layer model N80-27895
Correlations of seismic velocity with depth in southern California
[PB80-164080] N80-27906
STRUCTURAL RELIABILITY
Serviceability and reliability analysis of partially prestressed concrete beams N80-27716
STRUCTURAL STABILITY
Patching flexible and rigid pavements
[PB80-161243] N80-27541
STRUCTURAL STRAIN
Inelastic seismic response of a torsionally unbalanced single-story building model
[PB80-164197] N80-27538
STRUCTURAL WEIGHT
Multilevel optimum design of wing box structures with fiber composite panel components N80-27349
SUBMERGED BODIES
Structural and acoustic response of submerged shells of revolution N80-27718
Dynamic instability of an elastic cylindrical shell excited by a transient acoustic wave --- underwater structures
[AD-A083338] N80-27727
SUBROUTINES
CHEMEQ: A subroutine for solving stiff ordinary differential equations
[AD-A083545] N80-28097
SUBSIDENCE
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona --- Picacho Basin
[PB80-159908] N80-27788
SUBSONIC FLOW
The low-speed characteristics of a 15-percent quasi-elliptical circulation control airfoil with distributed camber
[AD-A084176] N80-27292
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632
SUBSONIC SPEED
Turbulent boundary layer at low and high subsonic speeds N80-27651
SUGAR CANE
Production of sugarcane and tropical grasses as a renewable energy source
[ORO-5912-T2] N80-27514
SULFATION
The sulfidation behavior of nickel-chromium, nickel-aluminum, and nickel-chromium-aluminum alloys with and without yttrium N80-27466
SULFUR
The fate and behavior of fuel-sulfur in combustion systems N80-27422
Electronic effects of sulfur in nickel: A model for grain boundary embrittlement
[AD-A083649] N80-27477
Hydrogen production using solid-polymer-electrolyte technology for water electrolysis and hybrid sulfur cycle
[EPRI-EM-1185] N80-27518
SULFURIC ACID
Effect on combined cycle efficiency of stack gas temperature constraints to avoid acid corrosion
[NASA-TM-81531] N80-27804
SUNSPOT CYCLE
Shuttle program. Solar activity prediction of sunspot numbers, predicted solar radio flux
[NASA-TM-81109] N80-28286
SUPERCONDUCTIVITY
Theory and design of electrical rotating machinery
[AD-A083499] N80-27604
Properties of superconductor-normal metal-superconductor microbridges N80-28215
SUPERCONDUCTORS
Superconductor insulator superconductor quasiparticle tunnel junctions as microwave receivers N80-28214
Properties of superconductor-normal metal-superconductor microbridges N80-28215
SUPERCRITICAL WINGS
Flutter analysis of a two-dimensional and two-degree-of-freedom supercritical airfoil in small-disturbance unsteady transonic flow
[AD-A084172] N80-27291
SUPERFLUIDITY
A study of persistent current in superfluid 4He N80-27528
Pulsed NMR and zero sound measurements in superfluid helium-three N80-28204
The phase diagram and magnetization of super fluid 3HE N80-28208
SUPERGIANT STARS
Observations of emission lines in M supergiants
[NASA-CR-163359] N80-28271
IUE observations of a luminous M supergiant that exhibits intense continuum in the far ultraviolet
[NASA-TM-80681] N80-28273
SUPERHIGH FREQUENCIES
IC Ku-Band impatt amplifier --- solid state spacecraft transmitter
[NASA-CR-160004] N80-27601
SUPERNOVA REMNANTS
Nature of type 1 Supernovae
[NASA-TM-76238] N80-28279
SUPERNOVAE
HI shells in the galaxy N80-28267
Nature of type 1 Supernovae
[NASA-TM-76238] N80-28279
SUPERSONIC AIRCRAFT
Flightworthy active control landing gear for a supersonic aircraft
[NASA-CR-3298] N80-27350
SUPERSONIC FLIGHT
Data report for an extensive store separation test program conducted at supersonic speeds
[AD-A083848] N80-27290
SUPERSONIC FLOW
Effect of Reynolds number on stability characteristics of a cruciform wind-body
[NASA-TP-1683] N80-27283
A second order accurate numerical method for supersonic boundary layer flow past a compression corner
[AD-A084550] N80-27294
SUPERSONIC WIND TUNNELS
Effect of Reynolds number on stability characteristics of a cruciform wind-body
[NASA-TP-1683] N80-27283
SURFACE DEFECTS
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
SURFACE FINISHING
Investigation of application parameters and testing of rain erosion coatings
[AD-A083578] N80-27430
Surface study of fusion research in universities linkage organization
[IPPJ-455] N80-28196
SURFACE GEOMETRY
Electromagnetic scattering by surfaces of arbitrary shape
[AD-A084347] N80-27580
Longitudinal vortices in concave surface boundary layer N80-27656
SURFACE PROPERTIES
Surface properties of antiferromagnetic metals and alloys N80-28217
Optical studies of the interface states at GaAs-metal Schottky barrier junctions
[AD-A083758] N80-28220
SURFACE REACTIONS
A multitechnique approach to surface studies of metals and alloys using X-ray photoelectron spectroscopy and secondary ion mass spectroscopy N80-27443
Quantitative secondary ion mass spectrometric analysis using ion implanation N80-27450
Fundamental studies of the structure and chemistry of solid surfaces --- hydrazine decomposition
[AD-A083964] N80-27475
Electron spectroscopic studies of surfaces and interfaces for adhesive bonding
[AD-A084254] N80-27492
Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28169
Electron spectroscopy studies of clean oxide surfaces, chemisorbed molecules and photo-assisted surface processes N80-28211
Electrons on the surface of liquid helium N80-28212
SURFACE ROUGHNESS
Electromagnetic scattering patterns from sinusoidal surfaces: Vertical polarization
[AD-A083919] N80-27560
Equilibrium boundary layers over very rough surfaces N80-27654
Remote sensing of soil moisture content over bare fields at 1.4 GHz frequency
[NASA-TM-80711] N80-27780
SURFACE TEMPERATURE
A new theory of turbulent convection over a heated surface N80-27823
The Earth's hydrosphere and cryosphere --- role of ocean circulation in models of climatic changes with emphasis on ocean surface temperature N80-27738
The performance of a seasonal global climatic model --- seasonal cycle of the temperature N80-27944
SURFACE WAVES
Road rater and Benkelman beam pavement deflections
[PB80-158439] N80-27530
Surface waves and anomalous sound absorption
[AD-A083844] N80-28154
SURGES
Transient stability analysis of ac-dc power systems N80-27595
SURVEILLANCE RADAR
Discrete address beacon system --- air traffic control N80-27344
ADSEL: Selective address SSR, performance of the evaluation station --- air traffic control N80-27345
Surveillance performance measurements of the SSR mode of the discrete address beacon system N80-27346
SWITCHING CIRCUITS
Modeling and analysis of switched interconnection networks N80-27594

Remote optical control and switching in optical fiber links
[AD-A083859] N80-28180

SYMBOLIC PROGRAMMING
Procedural attachment
[AD-A084637] N80-28092
Spatial data management system
[AD-A083948] N80-28236

SYMBOLS
Flight investigation of cockpit-displayed traffic information utilizing coded symbology on advanced operational environment
[NASA-TP-1684] N80-27380

SYMMETRY
Dynamical symmetry breaking in lattice gauge theories N80-28210

SYNCHROTRON RADIATION
Time-resolved spectroscopy using synchrotron radiation N80-27441

SYNOPTIC MEASUREMENT
Meteorological research — optimization of processing techniques applied to satellite sounding data N80-27738
Synoptic observations of Jupiter's radio emissions: Average Statistical properties observed by Voyager
[NASA-TM-80717] N80-28285

SYNOPTIC METEOROLOGY
A preliminary look at AVE-SESAME 2 conducted on 19-20 April 1979
[NASA-TM-78280] N80-27916

SYNTHETIC APERTURE RADAR
Radar test range design considerations
[AD-A084400] N80-27575

SYNTHETIC ARRAYS
Adaptive techniques for large space apertures
[AD-A084631] N80-27581
SAR object changes detection study
[AD-A084630] N80-27582
An analytical study of wave propagation through foliage
[AD-A084348] N80-27587

SYNTHETIC FUELS
Fundamental characterization of alternative fuel effects in continuous combustion systems N80-27382
Use of petroleum-based correlations and estimation methods for synthetic fuels
[NASA-TM-81533] N80-27509
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-58] N80-27515
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-55] N80-27516
Research and development of rapid hydrogenation for coal conversion to synthetic motor fuels, riser cracking of coal
[FE-2307-50] N80-27517

SYSTEMS ANALYSIS
Multicolor inversion diagnostic for tactital motor plumes
[AD-A083904] N80-27426
Thermophysical and Electronic Properties Information Analysis Center (TEPIAC). A continuing systematic program on data tables of thermophysical and electronic properties of materials
[AD-A083943] N80-27462
Theoretical and experimental study of the characteristics of a thin circular loop antenna above a homogeneous, dissipative half-space N80-27553
Model for the ready definition and approximate comparison of alternative high voltage transmission systems
[DOE/ET-5916-1] N80-27611
Multicharacteristic quality control: A survey
[AD-A083894] N80-27708
Computer-oriented methods for assessing reliability of complex systems N80-27860
A concept for developing human performance specifications
[AD-A084617] N80-28054

SYSTEMS ENGINEERING
HYCSOS: Hydride conversion and storage system sensitivity analysis
[ANL/EES-TM-63] N80-27523
The homogeneous machine N80-27593
Performance ripple effect analysis for large-scale isoftware maintenance
[AD-A084351] N80-28078

SYSTEMS MANAGEMENT
A systematic approach to the management of data on distributed data bases N80-28235
An architecture for information systems management
[AD-A084545] N80-28238

SYSTEMS STABILITY
Transient stability analysis of ac-dc power systems N80-27595

T

TAKEOFF
Current aviation statistics: Air traffic activity terminal area relationships, fiscal years 1977 and 1978
[AD-A078617] N80-27305

TARGET RECOGNITION
Resonances of radar targets and target discrimination
[AD-A083680] N80-27564
Application of linear prediction to multiclass sequential discrimination
[AD-A084272] N80-28124

TAXIING
SINTAC-C TMA: Application of SINTAC-C in the terminal area, during landing and ground taxiing --- integrated navigation, traffic control, collision avoidance and communication system N80-27338

TAYLOR INSTABILITY
Nonlinear equatorial spread F: Spatially large bubbles resulting from large horizontal scale initial perturbations
[AD-A083393] N80-27903

TDR SATELLITES
Shuttle program. STS-7 conceptual flight profile. IUS/TDRS-A
[NASA-TM-81090] N80-27405
Shuttle program. STS-7 feasibility assessment: IUS/TDRS-A
[NASA-TM-81091] N80-27406

TEA LASERS
A multiple pulse CO2 tea laser for use in thermal blooming studies
[AD-A083930] N80-27687

TECHNOLOGY ASSESSMENT
FAA/NASA Proceedings Workshop on Wake Vortex Alleviation and Avoidance
[NASA-CR-163317] N80-27285
Satellite Power Systems(SPS): Concept development and evaluation program, preliminary assessment
[DOE/ER-0041] N80-27404
Advanced fuel system technology for utilizing broadened property aircraft fuels
[NASA-TM-81536] N80-27510
A comprehensive review of traveling wave tube technology
[AD-A083899] N80-27603
Cavitation damage mechanisms: Review of literature
[AD-A083805] N80-27638
Experimental methods and techniques in turbulent boundary layer research N80-27648
Climate and climate modeling N80-27734
Dewatering systems for surface coal mines
[PB80-160153] N80-27789
Impact of propulsion system R and D on electric vehicle performance and cost
[NASA-TM-81548] N80-27805
Hydrogen technology: Foreign, change 1
[AD-A083665] N80-27816
Future aspects of earthquake prediction research N80-27889
Accuracy of aircraft velocities from inertial navigation systems for application to airborne wind measurements
[NASA-TM-81826] N80-27913

TECHNOLOGY TRANSFER
A regional technology transfer program — North Carolina Industrial Applications Center for the Southeast
[NASA-CR-163380] N80-28253

TECHNOLOGY UTILIZATION
Cost/benefit tradeoffs available in aircraft noise technology applications in the 1980's
[AD-A082028] N80-27357

TECTONICS
Proposed program for earthquake prediction in southern Spain — and study of the influence of large plate motions N80-27876
Seismotectonic evaluation of Europe, excluding the Balkans N80-27887

TELECOMMUNICATION
Communication over a quantum channel with feedback N80-27552
Development of an automated Remote Communications Air-Ground (RCAG) monitoring system
[AD-A083754] N80-27587
Microwave oscillators. Citations from the Engineering Index data base
[PB80-808298] N80-27817

TELEPHONY
Feasibility study for the teletransmission of data from geophysical network installed in a seismic area to an operational center N80-27878

TELEVISION SYSTEMS
Enhanced UK teletext moves towards still pictures
[BBC-RD-1980/4] N80-27545

TELLURIUM
Growth of HgCdTe by modified Molecular Beam Epitaxy (MBE)
[AD-A083799] N80-28170

TEMPERATURE DEPENDENCE
Development of a seasonally-verified planetary albedo parameterization for zonal energy balance climate models — latitudinal variation N80-27956

TEMPERATURE DISTRIBUTION
Simple seasonal climate models — seasonal temperature field N80-27941

TEMPERATURE EFFECTS
Effect of ambient temperature on vehicle emissions and performance factors
[PB80-162753] N80-27704
Effect of high ambient temperature on human performance N80-28023
Measurements of the temperature dependent diamagnetism of liquids N80-28147

TEMPERATURE PROFILES
On the prediction of temperature profiles at the exit of annular combustors N80-27377
Satellite measurements of atmospheric temperature N80-27749
Methods and problems in satellite temperature profiles and winds — vertical temperature and wind profiles N80-27756
Profiles of velocity and temperature near the Indian Ocean Equator, revision
[AD-A083779] N80-27975

TENNESSEE
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-29(80)] N80-27785

TENSILE STRENGTH
The strength and plastic properties of dilute copper-titanium alloy single crystals N80-27470

TERMINAL AREA ENERGY MANAGEMENT
Shuttle program. MCC Level C formulation requirements: Entry guidance and entry autopilot
[NASA-TM-81093] N80-27408
Shuttle program. MCC level C formulation requirements: Shuttle TAEM guidance and flight control
[NASA-TM-81094] N80-27409

TERMINAL GUIDANCE
SINTAC-C TMA: Application of SINTAC-C in the terminal area, during landing and ground taxiing --- integrated navigation, traffic control, collision avoidance and communication system N80-27338

TERNARY ALLOYS
Iron-based alloys strengthened by ternary Laves phases --- precipitation hardening
[PB80-157233] N80-27490

TERRAIN FOLLOWING AIRCRAFT
The development and test of a tactical self-contained landing system --- landing military helicopters when the safe corridor is unknown N80-27334

TERRESTRIAL RADIATION
Sampling problems and radiation budgets: Data requirements N80-27746

TEST EQUIPMENT
Development of test structures for characterization of the fabrication and performance of radiation-hardened Charge-Coupled Device (CCD) imagers
[PB80-160708] N80-27613
TEST FACILITIES
Engineering test facility design definition
[NASA-TM-81499] N80-27799
TEST RANGES
Radar test range design considerations
[AD-A084400] N80-27575
TEXAS
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy --- Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787
Red River Valley tornadoes of April 10, 1979. A report to the administrator
[PB80-165210] N80-27968
TEXTURES
Fitting mosaic models to textures
[AD-A084291] N80-28115
THEMATIC MAPPING
The GSFC Mark-2 three band hand-held radiometer --- thematic mapper for ground truth data collection
[NASA-TM-80641] N80-27674
THEORETICAL PHYSICS
Heat transport due to the collisionless tearing instabilities
[IPPJ-461] N80-28197
Dynamical symmetry breaking in lattice gauge theories N80-28210
A fiber bundle approach to unified field theory N80-28224
THERMAL BLOOMING
A multiple pulse CO2 tea laser for use in thermal blooming studies
[AD-A083930] N80-27687
THERMAL EMISSION
A comparison of radiative transfer models for predicting the microwave emission from soils
[NASA-TM-80686] N80-27777
THERMAL INSULATION
Composite wall concept for high temperature turbine shrouds: Heat transfer analysis
[NASA-TM-81539] N80-27362
THERMAL MAPPING
Screwworm Eradication Data System, phase 2 project plan: Field tests --- Mexico
[E80-10225] N80-27774
THERMAL PROTECTION
Ablation and ablative materials. Citations from the NTIS data base
[PB80-807837] N80-27438
THERMAL RADIATION
A computer program for thermal radiation from gaseous rocket exhaust plumes (GASRAD)
[NASA-CR-161498] N80-27423
THERMAL STABILITY
Heat stable polymers: Polyquinolines and other aromatic polymers
[AD-A083129] N80-27489
THERMOCHEMISTRY
Catalytic liquefaction of biomass
[LBL-10091] N80-27520
THERMODYNAMICS
A unified numerical approach for thermally induced stress waves N80-27714
THERMOELASTICITY
A unified numerical approach for thermally induced stress waves N80-27714
THERMOMECHANICAL TREATMENT
The mechanism of microstructural change and its consequences in a low carbon 6 nickel alloy N80-27468
THERMONUCLEAR POWER GENERATION
Reflection of oblique electron thermal modes in an inhomogenous plasma
[IPPJ-457] N80-28192
Comparative study of energy accounting for heavy ion fusion with various driver accelerators
[IPPJ-454] N80-28195
THERMOPHYSICAL PROPERTIES
Thermophysical and Electronic Properties Information Analysis Center (TEPIAC). A continuing systematic program on data tables of thermophysical and electronic properties of materials
[AD-A083943] N80-27462
THICK FILMS
Particle size effects on electrical properties of thick film resistors N80-27596
THIN FILMS
Amorphous thin films for solar cell application
[DOE/ET-23040-3] N80-27819
Optical properties and solar selectivity of metal-insulator composite films N80-28177
Incoherent detection of ultrasonic using thin film amorphous semiconductors
[AD-A083285] N80-28222
THREE DIMENSIONAL BOUNDARY LAYER
Three-dimensional turbulent boundary layer: Restructuration of an axisymetric flow subjected to a discontinuity of the wall peripheral velocity N80-27666
THREE DIMENSIONAL FLOW
An improved panel method for the solution of three-dimensional leadingedge vortex flows. Volume 2: User's guide and programmer's document
[NASA-CR-3279] N80-27280
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
Combustor modelling for scramjet engines N80-27379
Combustion zone modeling in unsteady regime N80-27385
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632
Research on numerical algorithms for the three dimensional Navier-Stokes equations. 1: Accuracy, convergence and efficiency
[AD-A083664] N80-27633
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction
[AD-A083703] N80-27639
THREE DIMENSIONAL MOTION
Quaternion utilization in a missile model
[AD-A084263] N80-27358
THROMBOSIS
Effects of hypodynamia on the hemocoagulative properties of the vascular wall and myocardium
[NASA-TM-76199] N80-27992
THRUST
Numerical optimization of circulation control airfoils
[AD-A084129] N80-27293
THRUST AUGMENTATION
Computation of the turbulent mixing in curved ejectors --- V/STOL aircraft
[AD-A083905] N80-27634
THUNDERSTORMS
Preliminary investigations of the electrical response of water surfaces during marine thunderstorms N80-27911
The University of Oklahoma severe storms intercept project-1979
[PB80-166010] N80-27972
THYROID GLAND
State of rat thyroid C cells following flights on the Cosmos type of biosatellites (according to results of a morphological study) --- effects of weightlessness N80-28001
TIDES
Propagation and generation of internal tides on the continental margin N80-27973
TIMBER INVENTORY
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
TIME DEPENDENCE
Time-resolved spectroscopy using synchrotron radiation N80-27441
Predictor-corrector methods for time dependent compressible flows N80-27619
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels N80-27717
Space and time scales of ocean circulation --- mid-ocean circulation experiments N80-27747
Time-varying queues requiring secondary service mechanisms for primary servers N80-28085
MHD channel flow and heat transfer in a time-dependent spatially varying magnetic field N80-28183
TIME SERIES ANALYSIS
Investigation of a seismic model using a three layer model N80-27895
Modern empirical statistical spectral analysis
[AD-A084142] N80-28120
Modeling and investigation of periodic phenomena using techniques of time series analysis N80-28129
Recursive estimation in time series models N80-28131
TISSUES (BIOLOGY)
Isolation and gas chromatographic demonstration of volatile organic substances in thin-layer biological samples N80-28014
State of human bone tissue protein fraction after space flights N80-28018
TITANIUM ALLOYS
Beta decomposition in binary Ti-Cr alloys N80-27469
The embrittlement of alloys under impulse thermal, pressure and chemical conditions
[AD-A083743] N80-27476
TITANIUM OXIDES
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27798
Electron spectroscopy studies of clean oxide surfaces, chemisorbed molecules and photo-assisted surface processes N80-28211
TOKAMAK DEVICES
Equilibrium and stability in strongly inhomogeneous plasmas --- confinement schemes including field-reversed mirrors and tokamak sheaths N80-28188
Surface study of fusion research in universities linkage organization
[IPPJ-455] N80-28196
TORNADOES
Red River Valley tornadoes of April 10, 1979. A report to the administrator
[PB80-165210] N80-27968
The University of Oklahoma severe storms intercept project-1979
[PB80-166010] N80-27972
TORQUE
The wavy mechanical seal: Theoretical and experimental results
[AD-A083933] N80-27700
TORQUE CONVERTERS
Small passenger car transmission test-Chevrolet 200 transmission
[NASA-CR-159835] N80-28255
TOXIC HAZARDS
Characteristics of enzymatic induction provoked by chlordane
[NASA-TM-76194] N80-28047
TOXICITY
Toxicity of vinyl chloride. Citations from the NTIS data base
[PB80-807662] N80-28051
TRACE CONTAMINANTS
Remote measurements of air pollutants
[PB80-164791] N80-27852
TRACE ELEMENTS
Adsorption of trace metals by hydrous ferric oxide in sea water
[PB80-152804] N80-27463
TRACKING RADAR
Comparison of an alpha-beta and kalman filter in track while scan radars
[AD-A084464] N80-27578
TRACKING STATIONS
Activities of the Kloppenheim satellite observation station
[SER-B-230] N80-28292
The Kloppenheim satellite observation station: Determination of longitude, latitude, and astronomical azimuth with the passage instrument ap 70 N80-28293

TRADEOFFS
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies, volume 1
[NASA-CR-163222] N80-28248
Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies. Volume 2: Appendices
[NASA-CR-163224] N80-28250
TRAFFIC CONTROL
Aerial surveys, geometrics, surface drainage, ecological impacts and safety appurtenances
[PB80-162233] N80-28257
TRAJECTORY ANALYSIS
STS-1 operational flight profile. Volume 6: Abort analysis
[NASA-TM-81098] N80-27413
TRANSFER FUNCTIONS
Harmonic analysis of feedbacks: A transfer function climate model N80-27954
TRANSFORMATIONS (MATHEMATICS)
Stochastic integration, Markov property and measure transformation of random fields
N80-27598
Probability transforms of digital pictures
[AD-A084266] N80-28071
A path-length distance transform for quadtrees
[AD-A084293] N80-28072
TRANSFORMERS
Development of flammability criteria for transformer dielectric fluids
[PB80-163777] N80-27612
TRANSIENT RESPONSE
The theory and effects of neglecting stator and network transients N80-27592
Instructions for the use of the CIVM-Jet 4C finite-strain computer code to calculate the transient structural responses of partial and/or complete arbitrarily-curved rings subjected to fragment impact
[NASA-CR-159873] N80-27720
Transient diffusion in multi-layer biological tissue
N80-27979
TRANSITION PROBABILITIES
Tables of transition probabilities and branching ratios for electric dipole transmissions between arbitrary levels of hydrogen-like atoms
[NASA-TM-80682] N80-28167
TRANSMISSIONS (MACHINE ELEMENTS)
Small passenger car transmission test-Chevrolet 200 transmission
[NASA-CR-159835] N80-28255
TRANSMITTANCE
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
TRANSMITTER RECEIVERS
Very lightweight air traffic management system using an electronic scan antenna N80-27335
TRANSMITTERS
IC Ku-Band impatt amplifier --- solid state spacecraft transmitter
[NASA-CR-160004] N80-27601
TRANSOCEANIC COMMUNICATION
Theoretical feasibility of digital communication over ocean areas by high frequency radio
[AD-A079424] N80-27568
TRANSONIC FLOW
Transonic small disturbances equation applied to the solution of two-dimensional nonsteady flows
[NASA-TM-75795] N80-27279
CAS2D: FORTRAN program for nonrotating blade-to-blade, steady, potential transonic cascade flows
[NASA-TP-1705] N80-27284
Experimental studies of scale effects on oscillating airfoils at transonic speeds
[NASA-TM-81216] N80-27287
Flutter analysis of a two-dimensional and two-degree-of-freedom supercritical airfoil in small-disturbance unsteady transonic flow
[AD-A084172] N80-27291
Finite element analysis of transonic flows
[AD-A084636] N80-27295
Mutual interference of multiple bodies in the flow field of the F-4C aircraft in the transonic speed range --- wind tunnel tests
[AD-A084704] N80-27296
Numerical calculation of transonic axial turbomachinery flows
[NASA-TM-81544] N80-27363
TRANSPONDERS
Orbiter S-band direct link system verification test report
[NASA-TM-81110] N80-27414
TRANSPORT AIRCRAFT
Exploratory studies of the cruise performance of upper surface blown configurations --- wind tunnel tests
[NASA-CR-3193] N80-27281
TRANSPORT PROPERTIES
The composition, sources and sink of South Polar aerosols N80-27830
Air Resources Laboratories Atmospheric Transport And Dispersion model (ARL-ATAD)
[PB80-163652] N80-27853
TRANSVERSE ACCELERATION
Effect of transverse accelerations on innervation of the guinea pig's crural skeletal muscles N80-28005
TRAPPED PARTICLES
Laser induced fluorescence of trapped molecular ions N80-28165
TRAVELING WAVE TUBES
A comprehensive review of traveling wave tube technology
[AD-A083899] N80-27603
TREES (MATHEMATICS)
Representation of physics knowledge by experts and novices
[AD-A084452] N80-28148
TREES (PLANTS)
Data resolution versus forestry classification --- Sam Houston National Forest, Texas
[E80-10189] N80-27766
TRIANGULATION
Statistical investigation of the propagation of random and non-random errors in block aerotriangulation systems N80-27763
TROPICAL METEOROLOGY
Response to subtropical marine boundary-layer cloudiness to large-scale forcing N80-27909
TROPOSPHERE
Atmospheric structure and composition --- stratosphere/troposphere interactions N80-27737
Water vapor in the upper troposphere and in the stratosphere --- satellite observation N80-27753
The kinetic energy climatology of tropospheric and lower stratospheric flow regimes associated with 500 MB intermediate and short waves over North America N80-27863
Zonal and seasonal radiative effects of a doubling of atmospheric carbon dioxide concentration --- heating of the surface and troposphere N80-27952
TRUNCATION ERRORS
Optimizations of stochastic systems through simulation using stochastic approximation method
N80-28062
Sampling representations and approximations for certain functions and stochastic processes
N80-28128
A general mixture-truncation method for generating bivariate random variables from univariate generators
[AD-A084474] N80-28138
TUBE GRIDS
Contiguous gridded gun development program
[AD-A084046] N80-27608
TUNABLE LASERS
Project group for laser research
[LA-TR-79-46] N80-27691
TUNGSTEN
Effect of W and WC on the oxidation resistance of yttria-doped silicon nitride
[NASA-TM-81528] N80-27483
TUNGSTEN ALLOYS
Effect of CVD tungsten and IaC coatings on the mechanical behavior of SiC(C)
[AD-A083395] N80-27488
TUNGSTEN CARBIDES
Effect of W and WC on the oxidation resistance of yttria-doped silicon nitride
[NASA-TM-81528] N80-27483
TUNNELING (EXCAVATION)
Sonar probing as a mining and tunneling tool
[PB80-159239] N80-27790
TURBINE BLADES
Time-variant aerodynamics for torsional motion of large-turning airfoils
[AD-A083766] N80-27289
Comparison of elastic and elastic-plastic structural analyses for cooled turbine blade airfoils
[NASA-TP-1679] N80-27719
TURBINE ENGINES
Combustor Modelling --- conference
[AGARD-CP-275] N80-27371
TURBINES
Feasibility study of aileron and spoiler control systems for large horizontal axis wind turbines
[NASA-CR-159856] N80-27803
Evaluation of the vertical axis wind turbine at DREO
[AD-A083961] N80-27814
Wind characteristics for design of wind turbines: Research in the USA
[PNL-SA-7967] N80-27817
TURBOCOMPRESSORS
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
TURBOFANS
Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632
TURBOGENERATORS
Transient stability analysis of ac-dc power systems
N80-27595
TURBOJET ENGINES
Turbine flowmeters and their applications at the Naval Air Propulsion Center
[AD-A084181] N80-27680
TURBOMACHINE BLADES
CAS2D: FORTRAN program for nonrotating blade-to-blade, steady, potential transonic cascade flows
[NASA-TP-1705] N80-27284
TURBOMACHINERY
Documentation of cascade unsteady pressure difference program
[AD-A083987] N80-27368
Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery noise
[AD-A084355] N80-27369
Aerodynamic study of a combustion chamber with a view to its semi-empirical modelling N80-27395
TURBULENCE
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
Assessment of an approach to the calculation of the flow properties of spray-flames N80-27381
Turbulence behavior in a shock wave/boundary layer interaction N80-27655
A model of a suspended sediment induced, stably stratified oceanic bottom boundary layer
N80-27974
TURBULENT BOUNDARY LAYER
Summary of the AFOSR/MSU Research Specialists Workshop on Coherent Structure in Turbulent Boundary Layers
[AD-A083717] N80-27637
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction
[AD-A083703] N80-27639
Turbulent Boundary Layers: Experiments, Theory and Modeling --- conference
[AGARD-CP-271] N80-27647
Experimental methods and techniques in turbulent boundary layer research N80-27648
An experimental study of inward and outward flow in a turbulent boundary layer N80-27649
Experimental study of coherent structures in the turbulent boundary layer of pipe flow using laser-Doppler anemometry N80-27650
Turbulent boundary layer at low and high subsonic speeds N80-27651
An investigation of the structure of equilibrium turbulent boundary layers N80-27653
A discussion of probe effects and improved measuring techniques in the near-wall region of an incompressible three-dimensional turbulent boundary layer N80-27657
Developments in the computation of turbulent boundary layers N80-27658
A Navier-Stokes fast solver for turbulence modeling applications N80-27659
The turbulent boundary layer and the closure problem N80-27664

Three-dimensional turbulent boundary layer: Restructuration of an axisymetric flow subjected to a discontinuity of the wall peripheral velocity N80-27666

Experimental results concerning the influence of transition processes on the initial structure of a turbulent boundary layer N80-27668

Some measurements in synthetic turbulent boundary layers N80-27669

Coherent structures in turbulent boundary layers N80-27670

Flow visualization of turbulent boundary layer structure N80-27671

Some observations of the structure of the turbulent boundary layer N80-27672

TURBULENT DIFFUSION

A prediction model for turbulent diffusion flames including NO-formation N80-27375

Turbulent diffusion from a point source in stratified and neutral flows around a three dimensional hill. Part 1: Diffusion equation analysis
[PB80-163058] N80-27967

TURBULENT FLOW

Nature of inlet turbulence and strut flow disturbances and their effect on turbomachinery noise
[AD-A084355] N80-27369

Second-order closure modeling of turbulent mixing and reacting flows N80-27378

An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390

Computational approaches to the study of reactive flow mixing
[AD-A083912] N80-27457

An experimental study of the coherent motions in an axisymmetric mixing layer N80-27620

A new theory of turbulent convection over a heated surface N80-27623

Turbulence and vortex dynamics in two dimensions N80-27628

Influence of pressure driven secondary flows on the behavior of turbofan forced mixers
[NASA-TM-81541] N80-27632

Colloquim on flow separation
[AD-A083741] N80-27636

An experimental investigation of reactive, turbulent, recirculating jet mixing
[AD-A084546] N80-27642

Fundamental research in turbulent modeling
[AD-A084238] N80-27643

Coherent structures in time dependent shear flows N80-27652

Reynolds stress closures: Status and prospects N80-27660

Large eddy simulation of turbulent channel flow: ILLIAC 5 calculation N80-27661

A turbulence closure of the transport equation for the probability density of velocity N80-27662

Modelling requirements for the calculation of the turbulent flow around airfoils, wings and bodies of revolution N80-27663

The turbulent boundary layer and the closure problem N80-27664

Evidence for instability-waves in the velocity-field of a fully developed turbulent channel-flow N80-27667

Some measurements in synthetic turbulent boundary layers N80-27669

Coherent structures in turbulent boundary layers N80-27670

TURBULENT MIXING

Computation of the turbulent mixing in curved ejectors — V/STOL aircraft
[AD-A083905] N80-27634

The annual variability of sea surface temperature: Observation and simulation N80-27940

TURBULENT WAKES

A numerical and experimental study of the turbulent wakes of turbomachinery rotor blades, isolated airfoils, and a cascade of airfoils N80-27277

TWILIGHT GLOW

The influence of NO and ClO variations at twilight on the interpretation of solar occultation measurements N80-27868

TWO DIMENSIONAL FLOW

Transonic small disturbances equation applied to the solution of two-dimensional nonsteady flows
[NASA-TM-75795] N80-27279

Flutter analysis of a two-dimensional and two-degree-of-freedom supercritical airfoil in small-disturbance unsteady transonic flow
[AD-A084172] N80-27291

Combustor modelling for scramjet engines N80-27379

Combustion zone modeling in unsteady regime N80-27385

Turbulence and vortex dynamics in two dimensions N80-27628

TWO PHASE FLOW

Conceptual design of two-phase fluid mechanics and heat transfer facility for spacelab
[NASA-CR-159810] N80-27403

Digital image analysis of two phase flow data
[AD-A084187] N80-27646

U

U.S.S.R.

Inventory of snow cover and sea ice data — Northern and Southern Hemispheres
[PB80-164007] N80-27794

U.S.S.R. SPACE PROGRAM

Results of the investigation of the otolith function in manned space flights
[NASA-TM-76103] N80-28046

ULCERS

Experimental gastric ulcers induced by immobilization and electric shock of rats and their pharmacotherapy
[NASA-TM-76157] N80-27981

Effect of psychotropic drugs on gastric ulcers induced by immobilization: Increased protective effect of amitriptyline caused by chlordiazepoxide
[NASA-TM-76197] N80-27991

ULTRASONIC SOLDERING

Ultrasonically activated diffusion bonding for fluidic control assembly
[AD-A084658] N80-27702

ULTRASONIC TESTS

Generalized Approach to New Problems in Ultrasonic Inspection (GANPUI)
[AD-A083931] N80-27709

Interdisciplinary study on advanced NDI techniques
[AD-A084242] N80-27712

Defect characterization and dimensioning of cracks in welds by the ultrasonic diffraction method
[PB80-161755] N80-27713

Ultrasonic method of recording gas bubbles in animal venous blood in a rarefied atmosphere N80-28013

ULTRASONICS

A 16 level color display system for two dimensional ultrasonic data
[AD-A083854] N80-27678

Incoherent detection of ultrasonic using thin film amorphous semiconductors
[AD-A083285] N80-28222

ULTRAVIOLET ASTRONOMY

IUE observations of a luminous M supergiant that exhibits intense continuum in the far ultraviolet
[NASA-TM-80681] N80-28273

ULTRAVIOLET RADIATION

Control of physical agent hazards of arc welding and cutting
[PB80-164866] N80-27705

ULTRAVIOLET SPECTRA

Optical spectroscopy of molecules absorbed on the nickel (111) surface N80-27446

ULTRAVIOLET SPECTROMETERS

A solar extreme ultraviolet telescope and spectrograph for space shuttle. Volume 1: Investigation and technical plan
[NASA-TM-80643] N80-28272

ULTRAVIOLET SPECTROSCOPY

Stellar extreme ultraviolet spectroscopy N80-28265

UNDERGROUND STORAGE

Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175

UNDERWATER RESOURCES

Biosources Digest, a journal on biomass utilization, volume 1, no. 2 — ocean farming
[PB80-157662] N80-27795

UNDERWATER STRUCTURES

Dynamic instability of an elastic cylindrical shell excited by a transient acoustic wave — underwater structures
[AD-A083338] N80-27727

UNIFIED S BAND

Orbiter S-band direct link system verification test report
[NASA-TM-81110] N80-27414

UNIMOLECULAR STRUCTURES

Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28169

UNIQUENESS

Optimal simplex tableau characterization of unique and bounded solutions of linear programs
[AD-A083816] N80-28109

UNITED STATES OF AMERICA

Inventory of snow cover and sea ice data — Northern and Southern Hemispheres
[PB80-164007] N80-27794

UNSTEADY FLOW

Transonic small disturbances equation applied to the solution of two-dimensional nonsteady flows
[NASA-TM-75795] N80-27279

Experimental studies of scale effects on oscillating airfoils at transonic speeds
[NASA-TM-81216] N80-27287

Flutter analysis of a two-dimensional and two-degree-of-freedom supercritical airfoil in small-disturbance unsteady transonic flow
[AD-A084172] N80-27291

Analysis of algorithms for advection in discontinuous flows N80-27629

Coherent structures in time dependent shear flows N80-27652

UPPER ATMOSPHERE

High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements
[NASA-CP-2134] N80-27866

Executive summary of the Workshop on High Resolution Infrared Spectroscopy Techniques for Upper Atmospheric Measurements N80-27867

URANIUM

Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy — Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785

URBAN TRANSPORTATION

Transportation air quality analysis - sketch planning methods. Volume 2: Case studies
[PB80-158710] N80-27845

Phase 1 of the near term hybrid passenger vehicle development program
[NASA-CR-163219] N80-28245

Phase 1 of the near term hybrid passenger vehicles development program. Appendix A: Mission analysis and performance specification studies, volume 1
[NASA-CR-163220] N80-28246

Phase 1 of the near term hybrid passenger vehicle development program, appendix A. Mission analysis and performance specification studies. Volume 2: Appendices
[NASA-CR-163221] N80-28247

Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies, volume 1
[NASA-CR-163222] N80-28248

Phase 1 of the near team hybrid passenger vehicle development program. Appendix C: Preliminary design data package, volume 1
[NASA-CR-163223] N80-28249

Phase 1 of the near term hybrid passenger vehicle development program. Appendix B: Trade-off studies. Volume 2: Appendices
[NASA-CR-163224] N80-28250

Phase 1 of the near team hybrid passenger vehicle development program. Appendic C: Preliminary design data package. Volume 2: Appendices
[NASA-CR-163225] N80-28251

Phase 1 of the near term hybrid passenger vehicle development program. Appendix D: Sensitivity analysis
[NASA-CR-163226] N80-28252

Description and technical review of the Duke University automated people/cargo transportation system
[PB80-159734] N80-28256
Aerial surveys, geometrics, surface drainage, ecological impacts and safety appurtenances
[PB80-162233] N80-28257

URINE
Upgrading efficacy of membrane techniques for regenerating water from urine N80-28035

USER MANUALS (COMPUTER PROGRAMS)
An improved panel method for the solution of three-dimensional leadingedge vortex flows. Volume 2: User's guide and programmer's document
[NASA-CR-3279] N80-2726[illegible]
Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 13-23)
[E80-10226] N80-27775
Earth Observations Division version of the Laboratory for Applications of Remote Sensing System (EOD-LARSYS) user guide for the IBM 370/148. Volume 3: As-built documentation (sections 13-23)
[E80-10227] N80-27776
ONESAM, a computer program for nonparametric data analysis and density quantile estimation
[AD-A084259] N80-28077

USER REQUIREMENTS
User need in documentation and information. Citations from the NTIS data base
[PB80-807910] N80-28239

UTILITIES
Study of New England utilities' particulate air pollution control faciilities to determine relative viability of approaches to upgrade and retrofit
[PB80-154073] N80-27849

V

VAPOR DEPOSITION
Effect of CVD tungsten and IaC coatings on the mechanical behavior of SiC(C)
[AD-A083395] N80-27488

VAPOR PHASES
Theoretical study of a reaction-diffusion model for flame propagation in a gas N80-27440

VAPOR PRESSURE
Phase equilibrium of light gases and heavy hydrocarbons at elevated temperatures and pressures N80-28225

VARIABILITY
A severely truncated spectral model N80-27948

VARIANCE (STATISTICS)
Sampling considerations in estimating second moment climate quantities N80-27937
Variance reduction techniques for the simulation of queueing networks N80-28088
Contingency tables
[AD-A084262] N80-28134
A primal simplex variant for the maximum flow problem
[AD-A084282] N80-28145

VASCULAR SYSTEM
Effects of hypodynamia on the hemocoagulative properties of the vascular wall and myocardium
[NASA-TM-76199] N80-27992

VECTOR ANALYSIS
The primer vector in linear, relative-motion equations — spacecraft trajectory optimization
[NASA-TM-81111] N80-28096

VEGETATION
Backscattering of electromagnetic waves from a layer of vegetation
[AD-A083922] N80-27565

VELOCITY DISTRIBUTION
Profiles of velocity and temperature near the Indian Ocean Equator, revision
[AD-A083779] N80-27975

VELOCITY MEASUREMENT
Three dimensional mean flow and turbulence characteristics of the near wake of a compressor rotor blade
[NASA-CR-159518] N80-27288
Resonant Doppler velocimeter — flow visualization N80-27673
HI shells in the galaxy N80-28267

VENTILATION
Theoretical analysis of the effect of state of pulmonary circulation on distribution of ventilation-perfusion relations and gas exchange in the lungs N80-28011

VERTEBRAL COLUMN
Vertebral pain in helicopter pilots
[NASA-TM-75792] N80-28043

VERTICAL DISTRIBUTION
Ozone monitoring from space N80-27752
Water vapor in the upper troposphere and in the stratosphere — satellite observation N80-27753
Methods and problems in satellite temperature profiles and winds — vertical temperature and wind profiles N80-27756
A simulation of the January global circulation using a spectral model N80-27926

VERTICAL ORIENTATION
Electromagnetic scattering patterns from sinusoidal surfaces: Vertical polarization
[AD-A083919] N80-27560

VERTICAL TAKEOFF AIRCRAFT
System description and analysis. Part 1: Feasibility study for helicopter/VTOL wide-angle simulation image generation display system
[NASA-CR-152376] N80-27397
Computation of the turbulent mixing in curved ejectors — V/STOL aircraft
[AD-A083905] N80-27634

VERY LOW FREQUENCIES
Results of an ISEE-1 experiment to study the interactions between energetic particles and discrete VLF waves in the magnetosphere
[NASA-CR-160006] N80-27421
ULF/LF reflectivity of the polar ionosphere
[AD-A083240] N80-27901

VESTIBULAR TESTS
Human color discriminating function with muscular tension during exposure to vestibular stimuli N80-28004

VIBRATION
Vibration of composite structures
[AD-A084069] N80-27435

VIBRATION MODE
Finite element modelling of torsional eigenvibrations of the Earth N80-27854

VIBRATION TESTS
Tire stiffness and damping determined from static and free-vibration tests — aircraft tires
[NASA-TP-1671] N80-27302

VIDEO COMMUNICATION
Enhanced UK teletext moves towards still pictures
[BBC-RD-1980/4] N80-27545

VINYL COPOLYMERS
A study of the nature and origins of pyroelectricity in polyvinylidenefluoride and its co-polymers
[AD-A084448] N80-27490

VINYL POLYMERS
Functional polymers for removal of heavy-metal Pollutants from water
[PB80-158215] N80-27845

VIRGINIA
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy — Texas, Virginia, Georgia, North Carolina, South Carolina, and Tennessee
[GJBX-28(80)] N80-27785

VIRUSES
A computer graphics system for macromolecular model building N80-28068

VISCOMETERS
The study of non-Newtonian flows in the falling ball viscometer N80-27621

VISCOSITY
Finite difference solution of the nonlinear Cosserat jet equations for a viscous fluid with surface tension N80-27626
Calculation of the laminar viscosity of a gaseous mixture for gas dynamic mixing comparisons for a reacting shear layer
[AD-A083970] N80-27640
Fundamental research in turbulent modeling
[AD-A084238] N80-27643
Instrumentation for the measurement of viscosity and flow of biological fluids — neuclear magnetic resonance N80-27980

VISCOUS FLOW
The study of non-Newtonian flows in the falling ball viscometer N80-27621

VISIBILITY
Empirical studies of the relationships between emissions and visibility in the Southwest
[PB80-156136] N80-27904

VISUAL AIDS
An investigation of laser lighting systems to assist aircraft landing
[AD-A077722] N80-27315

VISUAL DISCRIMINATION
Human color discriminating function with muscular tension during exposure to vestibular stimuli N80-28004

VISUAL FLIGHT RULES
ATARS/ATC simulation tests with site adaptation logic in the Philadelphia terminal area
[AD-A083718] N80-27308

VISUAL PERCEPTION
The 1976 accident experience of civilian pilots with static physical defects
[AD-A077189] N80-27304

VOCODERS
Information processing techniques program. Volume 1. Packet speech systems technology
[AD-A083195] N80-27559

VOICE COMMUNICATION
Voice transmission at 6000 bits per second using delta modulation
[AD-A084375] N80-27577

VOICE DATA PROCESSING
Information processing techniques program. Volume 1. Packet speech systems technology
[AD-A083195] N80-27559

VOLTERRA EQUATIONS
A nonlinear Volterra equation in variable domain — nonlinear heat flow equation
[AD-A083829] N80-28107

VORTICES
An improved panel method for the solution of three-dimensional leadingedge vortex flows. Volume 2: User's guide and programmer's document
[NASA-CR-3279] N80-27280
An improved panel method for the solution of three-dimensional leading-edge vortex flows. Volume 1: Theory document
[NASA-CR-3278] N80-27282
FAA/NASA Proceedings Workshop on Wake Vortex Alleviation and Avoidance
[NASA-CR-163317] N80-27285
Chicago monostatic acoustic vortex sensing system. Volume 1: Data collection and reduction
[AD-A076929] N80-27306
Turbulence and vortex dynamics in two dimensions N80-27628
Longitudinal vortices in concave surface boundary layer N80-27656
Coherent structures in turbulent boundary layers N80-27670

VOYAGER PROJECT
Synoptic observations of Jupiter's radio emissions: Average Statistical properties observed by Voyager
[NASA-TM-80717] N80-28285

W

WALL FLOW
Fundamental research in turbulent modeling
[AD-A084238] N80-27643

WALL PRESSURE
A discussion of probe effects and improved measuring techniques in the near-wall region of an incompressible three-dimensional turbulent boundary layer N80-27657

WANKEL ENGINES
Performance, emissions, and physical characteristics of a rotating combustion aircraft engine, supplement A
[NASA-CR-135119] N80-27361

WARNING SYSTEMS
Red River Valley tornadoes of April 10, 1979. A report to the administrator
[PB80-165210] N80-27968

WASTE TREATMENT
Characterization of priority pollutants from an airplane parts manufacturing facility
[PB80-151566] N80-27848

WASTE WATER
Anaerobic-activated carbon filters for the removal of refractory and toxic organic compounds in wastewater
[PB80-164254] N80-28250

WATER FLOW
Undeveloped hydropower as a potential energy source in Idaho
[PB80-157399] N80-27824

WATER HEATING
Solar energy system performance evaluation: Seasonal report for Contemporary-Manchester, Manchester, New Hampshire
[NASA-CR-161471] N80-27802

WATER MANAGEMENT
The development of PALIS: A Ponds and Lakes Information System for Massachusetts
[PB80-156979] N80-27786
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787
Future US phosphorus loadings to the Great Lakes: An integration of water quality management planning information
[PB80-160336] N80-27791
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793

WATER POLLUTION
Functional polymers for removal of heavy-metal Pollutants from water
[PB80-158215] N80-27846

WATER QUALITY
Research on the hydrology and water quality of watersheds subjected to surface mining. Phase 1: Premining hydrologic and water quality conditions --- Ohio
[PB80-159510] N80-27784
Future US phosphorus loadings to the Great Lakes: An integration of water quality management planning information
[PB80-160336] N80-27791

WATER RECLAMATION
Upgrading efficacy of membrane techniques for regenerating water from urine N80-28035

WATER RESOURCES
Undeveloped hydropower as a potential energy source in Idaho
[PB80-157399] N80-27824

WATER TEMPERATURE
The annual variability of sea surface temperature: Observation and simulation N80-27940
Bottom-water temperature trends in the Middle Atlantic Bight during spring and autumn, 1964-76
[PB80-166200] N80-27977

WATER TREATMENT
Functional polymers for removal of heavy-metal Pollutants from water
[PB80-158215] N80-27846
Anaerobic-activated carbon filters for the removal of refractory and toxic organic compounds in wastewater
[PB80-164254] N80-28250

WATER VAPOR
Water vapor in the upper troposphere and in the stratosphere --- satellite observation N80-27753
A numerical investigation of the efficiency with which aerosol particles collide with cloud and small rain drops N80-27831

WATERSHEDS
Research on the hydrology and water quality of watersheds subjected to surface mining. Phase 1: Premining hydrologic and water quality conditions --- Ohio
[PB80-159510] N80-27784
Inventory of snow cover and sea ice data --- Northern and Southern Hemispheres
[PB80-164007] N80-27794

WAVE DISPERSION
Phase conjugate optics: On the theory, observation, and utilization of temporally-reversed wavefronts as generated via nonlinear optical parametric interactions N80-28178

WAVE FRONTS
Wavefront reproduction by stimulated Brillouin and Raman scattering N80-27685

WAVE PROPAGATION
Loran-C signal analysis
[AD-A084239] N80-27321
Muzzle blast overpressure levels on the AH-1S heliocopter tow sight unit
[AD-A084027] N80-27352
Computer programs for electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness
[AD-A084352] N80-27570
Statistical behavior of signals from the wideband signal
[AD-A084646] N80-27572
Loran-C signal analysis propagation model evaluation
[AD-A084338] N80-27583
An analytical study of wave propagation through foliage
[AD-A084348] N80-27587
Wave propagation in particulate media
[AD-A083742] N80-28179

WAVE REFLECTION
Investigation of wave frequency at different travel times --- applications to seismic prospecting
[BMFT-FB-T-79-77] N80-27892
Investigation of amplitude and frequency in seismic reflections: Study of the absorption of reflected seismic studies N80-27893
Experiments in the determination of seismic wave absorption N80-27894
ULF/LF reflectivity of the polar ionosphere
[AD-A083240] N80-27901

WEAR TESTS
A study of abrasive wear N80-27692

WEATHER FORECASTING
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757
A preliminary look at AVE-SESAME 2 conducted on 19-20 April 1979
[NASA-TM-78280] N80-27916
Review of atmospheric general circulation models N80-27919
National Hurricane and Experimental Meteorology Laboratory, fiscal year 1979
[PB80-165228] N80-27965

WEATHER MODIFICATION
Comments on the special issue of Communications in Statistics (Volume A8, No. 10) concerned with weather modification experiments
[AD-A083628] N80-27963

WEIBULL DENSITY FUNCTIONS
Sample size determinations for some reliability problems N80-27706

WEIGHT REDUCTION
Multilevel optimum design of wing box structures with fiber composite panel components N80-27349

WEIGHTING FUNCTIONS
Moving weighted average smoothing extended to the extremities of the data, revision
[AD-A083808] N80-28111

WEIGHTLESSNESS
Processing of materials in space --- using the molecular shield and space shuttle
[ISRO-SN-04-78] N80-27401
Results of studies of pulsed blood flow and regional vascular tonus during flights in the first and second expeditions aboard the Salyut-6-Soyuz orbital complex --- effects of weightlessness N80-27996
Hemodynamics and phase structure of the cardiac cycle in members of the first crew of Salyut-5 at rest --- effects of hypokinesia and weightlessness N80-27998
Effect of weightlessness and artificial gravity on ion-regulating function of rat kidneys N80-27999
Activity of some hepatic enzymes and lipogenetic processes in rat aipose tissue after space flight --- effects of weightlessness N80-28000
State of rat thyroid C cells following flights on the Cosmos type of biosatellites (according to results of a morphological study) --- effects of weightlessness N80-28001
Studies of prognostic significance of antiorthostatic position N80-28006
Evaluation of efficacy of the set of preventive measures referable to the human neuromuscular system under hypokinetic conditions N80-28007
Theoretical analysis of the effect of state of pulmonary circulation on distribution of ventilation-perfusion relations and gas exchange in the lungs N80-28011
Isolation and gas chromatographic demonstration of volatile organic substances in thin-layer biological samples N80-28014
Circulation at rest in crew members of the first main expedition abnard Salyut 6 N80-28017
State of human bone tissue protein fraction after space flights N80-28018
Research hardware and habitat of animals used in experiment aboard Cosmos-936 biosatellite N80-28019
Principal results of physiological experiments with mammals aboard the Cosmos-936 biosatellite N80-28020
Semicircular canal function in rats after flight aboard the Cosmos-936 biosatellite N80-28021
Role of dynamic space flight factors in the pathogenesis of involution of lymphatic organs (experimental morphological study) N80-28022
Results of the investigation of the otolith function in manned space flights
[NASA-TM-76103] N80-28046

WEIGHTLESSNESS SIMULATION
Functional state of the cardiovascular system under the combined effect of 28 day immersion, rotation on a short-arm centrifuge and exercise on a bicycle argometer N80-28025

WELDING
Defect characterization and dimensioning of cracks in welds by the ultrasonic diffraction method
[PB80-161755] N80-27713

WHEAT
On the accuracy of pixel relaxation labeling
[E80-10185] N80-27765
Analysis of scanner data for crop inventories --- Brazil and Argentina
[E80-10191] N80-27767

WIDEBAND COMMUNICATION
Information processing techniques program. Volume 1. Packet speech systems technology
[AD-A083195] N80-27559

WIND (METEOROLOGY)
Analysis of meteorological observations from an array of buoys during JASIN
[AD-A084034] N80-27960
The University of Oklahoma severe storms intercept project-1979
[PB80-166010] N80-27972

WIND EFFECTS
Ocean circulation --- validating models with altimeter and wind data from satellites N80-27760

WIND PROFILES
Methods and problems in satellite temperature profiles and winds --- vertical temperature and wind profiles N80-27756
Global wind determination by interferometric techniques in the troposphere stratosphere and mesosphere N80-27759

WIND TUNNEL STABILITY TESTS
Effect of Reynolds number on stability characteristics of a cruciform wind-body
[NASA-TP-1683] N80-27280

WIND TUNNEL TESTS
Exploratory studies of the cruise performance of upper surface blown configurations --- wind tunnel tests
[NASA-CR-3193] N80-27281
Experimental studies of scale effects on oscillating airfoils at transonic speeds
[NASA-TM-81216] N80-27287
Mutual interference of multiple bodies in the flow field of the F-4C aircraft in the transonic speed range --- wind tunnel tests
[AD-A084704] N80-27296
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction
[AD-A083703] N80-27639

WIND VELOCITY MEASUREMENT
Accuracy of aircraft velocities from inertial navigation systems for application to airborne wind measurements
[NASA-TM-81826] N80-27913

WINDMILLS (WINDPOWERED MACHINES)
Feasibility study of aileron and spoiler control systems for large horizontal axis wind turbines
[NASA-CR-159856] N80-27803

WINDPOWER UTILIZATION
Evaluation of the vertical axis wind turbine at DREO
[AD-A083961] N80-27814
Wind characteristics for design of wind turbines: Research in the USA
[PNL-SA-7967] N80-27817
WINDPOWERED GENERATORS
Evaluation of the vertical axis wind turbine at DREO
[AD-A083961] N80-27814
WING FLAPS
Boundary layer measurements on a two-dimensional wing with flap and a comparison with calculations
N80-27665
WING PANELS
Multilevel optimum design of wing box structures with fiber composite panel components N80-27349
WINGS
Boundary layer measurements on a two-dimensional wing with flap and a comparison with calculations
N80-27665
Biological and aerodynamic problems with the flight of animals
[NASA-TM-75337] N80-27985
WINTER
Simulation of January climate with a general circulation model — realization of baroclinic instability as well as interaction between the oceans and the atmosphere N80-27928
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964

X

X RAY ABSORPTION
X-ray absorption studies of graphite intercalates and metal-ammonia solutions — arsenic fluorocomplexes and rubidium-ammonia N80-28213
X RAY ANALYSIS
Low energy X-ray and electron interactions within matter
[AD-A083962] N80-28158
X RAY ASTRONOMY
Rocket studies of solar corona and transition region — X-Ray spectrometer/spectrograph telescope
[NASA-CR-160001] N80-28256
The HEAO A-2 survey of Abell clusters and the X-ray luminosity function
[NASA-TM-80680] N80-28290
X RAY IMAGERY
Catoptrical X-ray optical system for use in laser-fusion diagnostics
[AD-A084686] N80-28201
X RAY SOURCES
X-ray spectral constraints on the broad-line cloud geometry of NGC 4151
[NASA-TM-80726] N80-27915
Comptomization and radiation spectra of X-ray sources. Calculation of the Monte Carlo method
[NASA-TM-76181] N80-28193
The X-ray spectrum of QSO 0241+622 — OSO-8 observations
[NASA-TM-80645] N80-28285
X RAY SPECTRA
Comptomization and radiation spectra of X-ray sources. Calculation of the Monte Carlo method
[NASA-TM-76181] N80-28193
The X-ray spectrum of QSO 0241+622 — OSO-8 observations
[NASA-TM-80645] N80-28285
X RAY SPECTROSCOPY
A multitechnique approach to surface studies of metals and alloys using X-ray photoelectron spectroscopy and secondary ion mass spectroscopy
N80-27443
Low energy X-ray and electron interactions within matter
[AD-A083962] N80-28158
X RAY STRESS ANALYSIS
X-Ray techniques for the measurement of residual stresses in the real world
[AD-A083798] N80-27711
X RAYS
Cost/benefit analysis of reentry vehicle hardness testing using the FAST methodology. Volume 2: Methods
[AD-A083338] N80-27420
XENON FLUORIDE LASERS
Computer program for the kinetics and populations in a xenon fluoride laser
[AD-A084458] N80-27890

Y

YTTRIUM
Composite wall concept for high temperature turbine shrouds: Heat transfer analysis
[NASA-TM-81539] N80-27362
Effect of W and WC on the oxidation resistance of yttria-doped silicon nitride
[NASA-TM-81528] N80-27483
YTTRIUM OXIDES
Effect of starting powder characteristics on density, microstructure and low temperature oxidation behavior of a Si3N4w/o Y2O3 ceramic
[NASA-TM-81536] N80-27484

Z

ZIRCONIUM
Composite wall concept for high temperature turbine shrouds: Heat transfer analysis
[NASA-TM-81539] N80-27362

PERSONAL AUTHOR INDEX

Typical Personal Author Index Listing

Listings in this index are arranged alphabetically by personal author. The NASA accession number denotes the number by which the citation is identified.

CORPORATE SOURCE INDEX

Typical Corporate Source Index Listing

Listings in this index are arranged alphabetically by corporate source. The title of the document provides the user with a brief description of the subject matter. The report number helps to indicate the type of document cited (e.g., NASA report, translation, NASA contractor report). The NASA accession number denotes the number by which the citation is identified. The titles are arranged under each corporate source in ascending accession number order.

A

ADAPTRONICS, INC., MCLEAN, VA.
Investigation into adaptive control of a slip-cast, reaction-bonded silicon-nitride process via adaptive learning network modeling
[AD-A083730] N80-28091

ADELAIDE UNIV. (AUSTRALIA).
Some observations of the structure of the turbulent boundary layer N80-27672

ADVISORY GROUP FOR AEROSPACE RESEARCH AND DEVELOPMENT, NEUILLY-SUR-SEINE (FRANCE).
Air Traffic Management: Civil/Military System and Technologies
[AGARD-CP-273] N80-27324
Combustor Modelling
[AGARD-CP-275] N80-27371
Turbulent Boundary Layers: Experiments, Theory and Modeling
[AGARD-CP-271] N80-27647
A turbulence closure of the transport equation for the probability density of velocity N80-27662

AERODYNE RESEARCH, INC., BEDFORD, MASS.
A study of real time signal processing methods for decoding spread spectrum systems
[AD-A084349] N80-27588

AERONAUTICAL RESEARCH ASSOCIATES OF PRINCETON, INC., N. J.
Second-order closure modeling of turbulent mixing and reacting flows N80-27378
Fundamental research in turbulent modeling
[AD-A084238] N80-27643

AERONAUTICAL SYSTEMS DIV., WRIGHT-PATTERSON AFB, OHIO.
Characteristic for a moderate accuracy Inertial Navigation System (INS)
[AD-A084036] N80-27318

AEROSPACE CORP., EL SEGUNDO, CALIF.
Multicolor inversion diagnostic for tactital motor plumes
[AD-A083904] N80-27426
Numerical solutions for laminar boundary layer behind blast waves
[AD-A084435] N80-27644
The Electric Simulator Program (ESP) usage guide
[AD-A084676] N80-28075
An analytical integration of the averaged equations of variation due to sun-moon perturbations and its application
[AD-A083231] N80-28281

AEROSPACE MEDICAL RESEARCH LABS., WRIGHT-PATTERSON AFB, OHIO.
Community noise exposure resulting from aircraft operations. Volume 7: Acoustic data on aircraft ground runup noise suppressors
[AD-A083701] N80-27837
The effects of high level infrasound
[AD-A081792] N80-28159

AIR FORCE GEOPHYSICS LAB., HANSCOM AFB, MASS.
Gas replenishment techniques for use in high-altitude, long-duration scientific balloon flights
[AD-A084486] N80-27297
A discussion of artic ionograms
[AD-A083550] N80-27898
A method for direct determination of real height from virtual height data for the auroral region of the ionosphere
[AD-A083139] N80-27899
Marine boundary layer sampling, flight no. 2
[AD-A083158] N80-27900
Microphysical properties of a large scale cloud system
[AD-A083140] N80-27964

AIR FORCE INST. OF TECH., WRIGHT-PATTERSON AFB, OHIO.
Quaternion utilization in a missile model
[AD-A084263] N80-27358

AIR FORCE MATERIALS LAB., WRIGHT-PATTERSON AFB, OHIO.
Fluoroalkyleneether silicate/viton GLT blends for hydraulic system seals: Synthesis, blending, and testing
[AD-A084708] N80-27701

AIR FORCE SYSTEMS COMMAND, WRIGHT-PATTERSON AFB, OHIO.
Project group for laser research
[LA-TR-79-46] N80-27691

AIX-MARSEILLES UNIV. (FRANCE).
Three-dimensional turbulent boundary layer: Restructuration of an axisymetric flow subjected to a discontinuity of the wall peripheral velocity N80-27666

AKADEMIYA NAUK SSSR, NOVOSIBIRSK.
Numerical simulation of the global circulation of the atmosphere N80-27927

AKRON UNIV., OHIO.
Tear strength and tensile strength of model filled elastomers
[AD-A083168] N80-27485

AMAF INDUSTRIES, COLUMBIA, MD.
Feasibility of offset carrier systems for air traffic control
[AD-A084044] N80-27309

ANKARA UNIV. (TURKEY).
Earthquake prediction research for the northern Anatolian fault zone (Turkey) N80-27885

APPLETON LAB., SLOUGH (ENGLAND).
Satellite measurements of atmospheric temperature N80-27749

APPLIED PHYSICS LAB., JOHNS HOPKINS UNIV., LAUREL, MD.
Energy programs at the Johns Hopkins University Applied Physics Laboratory
[PB80-163686] N80-27825
Assessment of atmospheric height uncertainties for high precision satellite altimeter missions to monitor ocean currents
[NASA-CR-156868] N80-27873

APPLIED SCIENCE ASSOCIATES, INC., APEX, N. C.
An analytical study of wave propagation through foliage
[AD-A084348] N80-27587

ARGONNE NATIONAL LAB., ILL.
HYCSOS: Hydride conversion and storage system sensitivity analysis
[ANL/EES-TM-63] N80-27523

ARINC RESEARCH CORP., ANNAPOLIS, MD.
An evaluation of aircraft separation assurance concepts using airline flight simulators. Volume 1: Study report
[AD-A083986] N80-27310
An evaluation of aircraft separation assurance concepts using airline flight simulators. Volume 2: Appendices
[AD-A083897] N80-27311

ARIZONA STATE UNIV., TEMPE.
An anomaly in the Pearson product-moment correlation coefficient
[AD-A084354] N80-28136

ARIZONA UNIV., TUCSON.
Exterior-interior aperture coupling of a rectangular cavity with wire obstacle
[AD-A084258] N80-27586
Optical performance analysis of CO2 laser fusion systems N80-27684
Geophysical and hydrologic prediction of fissuring and land subsidence, south-central Arizona
[PB80-159908] N80-27788
Low surface brightness spiral galaxies N80-28264

ARMY AIR TRAFFIC CONTROL OFFICE, APO NEW YORK, N.Y. 09056.
US Army users outlook on air traffic management N80-27333

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, ABERDEEN PROVING GROUND, MD.
Free vibrations of a concentric circular conical beam with a concentric circular cylindrical bore
[AD-A083292] N80-27724

ARMY ARMAMENT RESEARCH AND DEVELOPMENT COMMAND, WATERVLIET, N. Y.
Effect of CVD tungsten and IaC coatings on the mechanical behavior of SiC(C)
[AD-A083395] N80-27488
Stress singularity at the vertex of a flat wedge-shaped crack by a variable method
[AD-A083871] N80-27723

ARMY AVIATION RESEARCH AND DEVELOPMENT COMMAND, CLEVELAND, OHIO.
Loss model for off-design performance analysis of radial turbines with pivoting-vane, variable-area stators
[NASA-TM-81532] N80-27365

ARMY AVIONICS RESEARCH AND DEVELOPMENT ACTIVITY, FORT MONMOUTH, N. J.
Helicopter air traffic management systems with civil/military interoperability N80-27326
The development and test of a tactical self-contained landing system N80-27334

ARMY CONSTRUCTION ENGINEERING RESEARCH LAB., CHAMPAIGN, ILL.
True-integrating environmental noise monitor and sound-exposure level meter. Volume 4: Mechanical construction and electrical check out
[AD-A083321] N80-28155
True-integrating environmental noise monitor and sound-exposure level meter. Volume 3: Microprocessor program and data interface description
[AD-A083320] N80-28156

SOURCE

ARMY ELECTRONICS RESEARCH AND DEVELOPMENT COMMAND, FORT BELVOIR, VA.
Effect of various dielectrics on the design of millimeter-wave line scanning antennas
[AD-A083791] N80-27566
ARMY ENGINEER TOPOGRAPHIC LABS., FORT BELVOIR, VA.
Backscattering of electromagnetic waves from a layer of vegetation
[AD-A083922] N80-27565
ARMY MISSILE COMMAND, REDSTONE ARSENAL, ALA.
Quiet radar processor analysis by covariance matrix transformations
[AD-A084453] N80-27585
Calculation of the laminar viscosity of a gaseous mixture for gas dynamic mixing comparisons for a reacting shear layer
[AD-A083970] N80-27640
Stress intensities around transverse surface flaws in cylindrical shells by photoelastic stress freezing
[AD-A083073] N80-27725
ARO, INC., ARNOLD AIR FORCE STATION, TENN.
Mutual interference of multiple bodies in the flow field of the F-4C aircraft in the transonic speed range
[AD-A084704] N80-27296
Raman scattering studies of solid-phase species
[AD-A083926] N80-27459
An experimental investigation of reactive, turbulent, recirculating jet mixing
[AD-A084546] N80-27642
ASL ENGINEERING, INC., SANTA BARBARA, CALIF.
Identification of superior energy-absorbing materials for school bus interiors. Volume 1: Summary report
[PB80-165269] N80-28262
Identification of superior energy-absorbing materials for school bus interiors. Volume 2: Technical report
[PB80-165277] N80-28263
ATMOSPHERIC ENVIRONMENT SERVICE, DOWNSVIEW (ONTARIO).
The atmospheric general circulation model
N80-27929
ATOMIC WEAPONS RESEARCH ESTABLISHMENT, ALDERMASTON (ENGLAND).
A multiple pulse CO2 tea laser for use in thermal blooming studies
[AD-A083930] N80-27687
AUSTRALIAN NUMERICAL METEOROLOGY RESEARCH CENTER, MELBOURNE.
A simulation of the January global circulation using a spectral model N80-27926
AVCO-EVERETT RESEARCH LAB., MASS.
Visible laser research one meter device
[AD-A084196] N80-27688

B

BALLISTIC RESEARCH LABS., ABERDEEN PROVING GROUND, MD.
Muzzle blast overpressure levels on the AH-1S helicopter tow sight unit
[AD-A084027] N80-27352
Analytical models for the compressive heating ignition of high explosives
[AD-A083889] N80-27460
Dynamics of a liquid-filled gyroscope: Up-date of theory and experiment
[AD-A083886] N80-27676
Capillary flowmeters for a accurate, stable flows of gases
[AD-A083874] N80-27677
BATTELLE COLUMBUS LABS., OHIO.
The general aviation dynamics model. Volume 1: Executive summary
[AD-A073543] N80-27273
The general aviation dynamic model. Volume 2: Technical report
[AD-A073544] N80-27274
Characterization of priority pollutants from an airplane parts manufacturing facility
[PB80-151566] N80-27848
Mechanical properties data center
[AD-A083123] N80-28237
BATTELLE PACIFIC NORTHWEST LABS., RICHLAND, WASH.
Wind characteristics for design of wind turbines: Research in the USA
[PNL-SA-7967] N80-27817
Assessment of effectiveness of geologic isolation systems. Test case release consequence analysis for a spent fuel repository in bedded salt
[PNL-2782] N80-28175
BEN GURION UNIV. OF THE NEGEV, BEERSHEVA (ISRAEL).
Desert convection clouds
[AD-A083965] N80-27962
BENDIX CORP., DETROIT, MICH.
Very lightweight air traffic management system using an electronic scan antenna N80-27335
BENDIX FIELD ENGINEERING CORP., GRAND JUNCTION, COLO.
Development of data enhancement and display techniques for stream-sediment data collected in the national uranium resource evaluation program of the United States Department of Energy
[GJBX-28(80)] N80-27785
BERKELEY RESEARCH ASSOCIATION, CALIF.
A power model for plasma convection
[AD-A084653] N80-28203
BOARD OF TRADE, LONDON (ENGLAND).
Air traffic in NATO Europe: Its characteristics and its needs N80-27325
BOEING AEROSPACE CO., SEATTLE, WASH.
An improved panel method for the solution of three-dimensional leadingedge vortex flows. Volume 2: User's guide and programmer's document
[NASA-CR-3279] N80-27280
An improved panel method for the solution of three-dimensional leading-edge vortex flows. Volume 1: Theory document
[NASA-CR-3278] N80-27282
Solar power satellite system definition study. Volume 1: Executive summary, phase 3
[NASA-CR-160742] N80-27809
Solar power satellite system definition study. Volume 2, part 3: Final briefing, 16 May 1980, phase 3
[NASA-CR-160743] N80-27810
Solar power satellite system definition study. Volume 3: Laser SPS analysis, phase 3
[NASA-CR-160744] N80-27811
Solar power satellite system definition study. Volume 4: Solid states SPS Analysis, phase 3
[NASA-CR-160745] N80-27812
Solar power satellite system definition study. Volume 5: Space transportation analysis, phase 3
[NASA-CR-160746] N80-27813
BOEING VERTOL CO., PHILADELPHIA, PA.
Study of cost/benefit tradeoffs available in helicopter noise technology applications
[AD-A083955] N80-27354
BOLT, BERANEK, AND NEWMAN, INC., CAMBRIDGE, MASS.
BMG reference manual
[AD-A084454] N80-28074
Historical development of noise exposure metrics
N80-28151
BOLT, BERANEK, AND NEWMAN, INC., CANOGA PARK, CALIF.
Cost/benefit tradeoffs available in aircraft noise technology applications in the 1980's
[AD-A082028] N80-27357
BONN UNIV. (WEST GERMANY).
A first European joint effort in earthquake prediction research N80-27884
BRITISH BROADCASTING CORP., KINGSWOOD (ENGLAND).
Enhanced UK teletext moves towards still pictures
[BBC-RD-1980/4] N80-27545
BRITISH COLUMBIA UNIV., VANCOUVER.
Equilibrium boundary layers over very rough surfaces N80-27654
BRITISH METEOROLOGICAL OFFICE, BRACKNELL (ENGLAND).
Atmospheric structure and composition
N80-27737
BRITISH PETROLEUM CO. LTD., SUNBURY-ON-THAMES (ENGLAND).
Stable coal/fuel oil dispersions N80-27503
BROWN UNIV., PROVIDENCE, R. I.
Finite element methods for heat transfer problems
[AD-A084450] N80-27641
Control of nonlinear systems
[AD-A083963] N80-28089
Optimal stationary linear control of the Wiener process
[AD-A084350] N80-28135
Remote optical control and switching in optical fiber links
[AD-A083659] N80-28180
BUREAU DE RECHERCHES GEOLOGIQUES ET MINIERES, ORLEANS (FRANCE).
Seismotectonic evaluation of Europe, excluding the Balkans N80-27887
BUREAU OF MINES, ALBANY, OREG.
Iron-based alloys strengthened by ternary Laves phases
[PB80-157233] N80-27480

C

CALIFORNIA INST. OF TECH., PASADENA.
Analysis of low-frequency disturbances in afterburners N80-27386
The homogeneous machine N80-27593
A software design system N80-28065
Phase conjugate optics: On the theory, observation, and utilization of temporally-reversed wavefronts as generated via nonlinear optical parametric interactions N80-28178
CALIFORNIA STATE DEPT. OF TRANSPORTATION, SACRAMENTO.
Development of a rebar dowel anchorage system for attaching the California type 25 concrete barrier to existing bridges
[PB80-161722] N80-27534
CALIFORNIA UNIV., BERKELEY.
Coupled bending-torsion flutter in cascades with applications to fan and compressor blades
N80-27396
Theoretical study of a reaction-diffusion model for flame propagation in a gas N80-27440
Time-resolved spectroscopy using synchrotron radiation N80-27441
Crossed beam reactive scattering of oxygen atoms and surface scattering studies of gaseous condensation N80-27442
The kinetics and mechanism of the formation of ozone by the anodic oxidation of water N80-27445
Optical spectroscopy of molecules absorbed on the nickel (111) surface N80-27446
The effects of non-carbide forming elements on the mechanical properties and microstructure of a secondary hardening steel N80-27465
An investigation of the microstructure and mechanical properties of thick section Cr-Mo steels
N80-27467
The mechanism of microstructural change and its consequences in a low carbon 6 nickel alloy
N80-27468
The combustion of carbon, coal and coal related fuels in an opposed flow diffusion flame burner
N80-27493
Hysteric behavior of reinforced concrete structural walls
[PB80-165905] N80-27533
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels
[PB80-167349] N80-27543
Stochastic integration, Markov property and measure transformation of random fields
N80-27598
Electron energy dissipation in layered media
N80-27600
Separation effects in gas-particle flows at high Reynolds numbers N80-27622
Numerical methods for inverse transient heat conduction problems N80-27624
Heat and mass transfer from a rotating disk with phase change N80-27625
Finite difference solution of the nonlinear Cosserat jet equations for a viscous fluid with surface tension
N80-27626
Analysis of algorithms for advection in discontinuous flows N80-27629
Laser induced fluorescence spectroscopy of OH in flames N80-27683
A study of abrasive wear N80-27692
Graphical techniques in reliability theory
N80-27707
Nonlinear geometric, material and time dependent analysis of reinforced and prestressed concrete slabs and panels N80-27717

Statistical investigation of the propagation of random and non-random errors in block aerotriangulation systems N80-27763
Chemical, structural and optical characterization of a black chrome solar selective absorber N80-27797
Photovoltaic properties of metal-merocyanine-TiO2 sandwich cells N80-27798
Land use and environmental impacts of decentralized solar energy use [DOE/EV-0067] N80-27843
Finite element modelling of torsional eigenvibrations of the Earth N80-27854
Computer-oriented methods for assessing reliability of complex systems N80-27860
Low-energy plasma in the dayside auroral zone N80-27861
Comments on the special issue of Communications in Statistics (Volume A8, No. 10) concerned with weather modification experiments [AD-A083628] N80-27963
Transient diffusion in multi-layer biological tissue N80-27979
Instrumentation for the measurement of viscosity and flow of biological fluids N80-27980
Computer networks: A martingale approach N80-28083
Rates of convergence for estimation and testing in multinomial distributions N80-28125
Recursive estimation in time series models N80-28131
A point mapping study of dynamical systems N80-28140
A systematic approach for the design and analysis of distributed computer systems N80-28141
Multiphoton dissociation of polyatomic molecules N80-28163
Multiphoton processes in isolated atoms and molecules N80-28164
Laser induced fluorescence of trapped molecular ions N80-28165
Crossed beam studies of full and half collisions N80-28166
Crossed molecular beam study of the reactions of oxygen and fluorine atoms [AD-A084255] N80-28174
Instabilities of a magnetized plasma driven by a velocity ring or a density gradient N80-28186
A study of the general plasma characteristics of a high power, multifilament ion source N80-28187
Equilibrium and stability in strongly inhomogeneous plasmas N80-28188
Nonlinear wave evoluation in Vlasov plasma. A Lie transform N80-28190
Experimental studies of excited metallic phases in stressed germanium N80-28205
Determination of morphology and electronic structure in solids with 20-1000 eV radiation N80-28206
Electron spectroscopy studies of clean oxide surfaces, chemisorbed molecules and photo-assisted surface processes N80-28211
Electrons on the surface of liquid helium N80-28212
X-ray absorption studies of graphite intercalates and metal-ammonia solutions N80-28213
Superconductor insulator superconductor quasiparticle tunnel junctions as microwave receivers N80-28214
The determination of electronic states in crystalline semiconductors and metals by angle-resolved photoemission N80-28216
Surface properties of antiferromagnetic metals and alloys N80-28217
Interactions in solids N80-28218
A mathematical study of the non-relativistic limit in quantum mechanics N80-28226
Evaluation and enhancement of the performance of relational database management systems N80-28233
A systematic approach to the management of data on distributed data bases N80-28235
Stellar extreme ultraviolet spectroscopy N80-28265
A 346 GHz heterodyne receiver and its use in observations of carbon monoxide in interstellar clouds N80-28268
Infrared fine-structure line emission from the galactic center N80-28269

CALIFORNIA UNIV., BERKELEY. LAWRENCE BERKELEY LAB.
Rapid ethanol production via fermentation [LBL-10219] N80-27519
Catalytic liquefaction of biomass [LBL-10091] N80-27520
Process development studies on the bioconversion of cellulose and production of ethanol [LBL-9909] N80-27521
Process development studies on the bioconversion of cellulose and production of ethanol [LBL-9220] N80-27522
Hydrolyzed wood slurry flow modeling [LBL-10090] N80-27703

CALIFORNIA UNIV., DAVIS.
Reynolds stress closures: Status and prospects N80-27660
Image Coding: Report of a Workshop [PB80-164817] N80-28240

CALIFORNIA UNIV., LIVERMORE. LAWRENCE LIVERMORE LAB.
Performance of the Lawrence Livermore Laboratory zonal atmospheric model N80-27947
Climate experiments: Albedo experiments with a zonal atmospheric model N80-27955

CALIFORNIA UNIV., LOS ANGELES.
Airfoils at sonic velocity N80-27278
A dynamic model of the air transport industry N80-27301
Multilevel optimum design of wing box structures with fiber composite panel components N80-27349
The sulfidation behavior of nickel-chromium, nickel-aluminum, and nickel-chromium-aluminum alloys with and without yttrium N80-27466
Determination of residual stress by magnetomechanical acoustic emission [AD-A084065] N80-27479
A study of persistent current in superfluid 4He N80-27528
Magnetospheric pulsations: Model and observations of standing Alfven wave resonances N80-27546
On the spatial capacity of packet radio networks N80-27549
Mutual coupling between dipoles and slots in the presence of grounded dielectric slabs N80-27597
Structural and acoustic response of submerged shells of revolution N80-27718
A numerical investigation of the efficiency with which aerosol particles collide with cloud and small rain drops N80-27831
Computer simulation of a magnetospheric substorm N80-27862
Correlations of seismic velocity with depth in southern California [PB80-164080] N80-27906
Studies in intramolecular motion N80-28161
Experimental investigation of the anomalous skin effect and computer simulation of the collisionless interchange instability N80-28184
Applying behavioral abstraction to information system design and integrity N80-28231
Security in data base management systems N80-28232
An architecture for information systems management [AD-A084545] N80-28238

CALIFORNIA UNIV., RICHMOND.
Optimum inelastic design of seismic-resistant reinforced concrete frame structures [PB80-164635] N80-27532

CAMBRIDGE SYSTEMATICS, INC., MASS.
Transportation air quality analysis - sketch planning methods. Volume 2: Case studies [PB80-158710] N80-27845

CAMBRIDGE THERMIONIC CORP., MASS.
Flow visualization of turbulent boundary layer structure N80-27671

CAMBRIDGE UNIV. (ENGLAND).
Liquid impact erosion mechanisms in transparent materials [AD-A084267] N80-27491
Ocean circulation N80-27760
Views of the future development, application and validation of general circulation models N80-27957

CANADIAN COMBUSTION RESEARCH LAB.-CANMET, CHATHAM (NEW BRUNSWICK).
Current status of the Canadian coal-oil mixture program N80-27496

CARNEGIE-MELLON UNIV., PITTSBURGH, PA.
Finite element analysis of transonic flows [AD-A084636] N80-27295

CATHOLIC UNIV. OF AMERICA, WASHINGTON, D. C.
Resonances of radar targets and target discrimination [AD-A083680] N80-27564

CENTRE D'ESSAI AERONAUTIQUE, TOULOUSE (FRANCE).
Turbulence behavior in a shock wave/boundary layer interaction N80-27655

CENTRE DE RECHERCHE CLAUDE-DELORME DE L'AIR LIQUIDE, JOUY-EN-JOSAS (FRANCE).
Modeling furnances fed with oxygen-enriched air N80-27385

CENTRE NATIONAL D'ETUDES SPATIALES, PARIS (FRANCE).
A view on outstanding experimental problems in space observation for meteorology and climatology N80-27757

CENTRE NATIONAL DE LA RECHERCHE SCIENTIFIQUE, GRENOBLE (FRANCE).
Ice sheets, glaciers, and climate N80-27742

CENTRE NATIONAL DE LA RECHERCHE SCIENTIFIQUE, MARSEILLES (FRANCE).
An experimental study of inward and outward flow in a turbulent boundary layer N80-27649

CENTRE NATIONAL DE LA RECHERCHE SCIENTIFIQUE, PARIS (FRANCE).
Space techniques N80-27739
Meteorological research and cloud parameter derivation from satellite data N80-27755
Project for seismogenetic research in the Calabrais arc N80-27880

CINCINNATI UNIV., OHIO.
A second order accurate numerical method for supersonic boundary layer flow past a compression corner [AD-A084550] N80-27294
Program documentation for the gas chromatography automation system N80-27464

CITY UNIV. OF NEW YORK, N. Y.
Conformation, electronic structure and reactivity as probed by photoelectron spectroscopy N80-27444
Force balancing machines and optimization of dynamic relations for planar mechanisms N80-27693

CIVIL AEROMEDICAL INST., OKLAHOMA CITY, OKLA.
Air traffic control automation: Its impact and use in the selection and screening of air traffic controllers N80-27329

CLARKSON COLL. OF TECHNOLOGY, POTSDAM, N.Y.
A microprocessor based high speed packet switch for satellite communications [NASA-CR-163357] N80-27557
A microprocessor based high speed packet switch for satellite communications, executive summary [NASA-CR-163357] N80-27558

CLEMSON UNIV., S.C.
Statistical methods in sole source contract negotiation [AD-A083983] N80-28227

COALIQUID, INC., LOUISVILLE, KY.
Operation of a central preparation plant for coal-oil-water mixtures N80-27500

COLLEGE OF AERONAUTICS, CRANFIELD (ENGLAND).
Investigation of three-dimensional shock wave boundary layer interactions. A flowfield model of the glancing shock/turbulent boundary layer interaction [AD-A083703] N80-27639

COLOGNE UNIV. (WEST GERMANY).
Radiation balance and radiation processes N80-27735
Ozone monitoring from space N80-27752

COLORADO STATE UNIV., FORT COLLINS.
Heat stable polymers: Polyquinolines and other aromatic polymers [AD-A083129] N80-27489
Application of geomorphic principles to environmental management in semiarid regions [PB80-169303] N80-27908

COLORADO UNIV. AT BOULDER.
Theoretical and experimental study of the characteristics of a thin circular loop antenna above a homogeneous, dissipative half-space N80-27553

COMMITTEE OF CONFERENCE (U. S. CONGRESS).

Gradient scattering theory demonstrates that VHF, spread-F radar backscatter reveals streaming instabilities
[AD-A084644] N80-27571
Development and application of a computational shear band model
[AD-A084029] N80-27721
Community impediments to implementation of solar energy
[DOE/EV-0059] N80-27821
Remote measurements of air pollutants
[PB80-164791] N80-27852
Effects of impulsive heating events on F-region chemistry and electron density
[AD-A083333] N80-27902
Formal techniques for fault-tolerance in Distributed Data Processing (DDP)
[AD-A084537] N80-28059
Inelastic collisions of excited atoms
[AD-A084524] N80-28172
STANFORD UNIV., CALIF.
Results of an ISEE-1 experiment to study the interactions between energetic particles and discrete VLF waves in the magnetosphere
[NASA-CR-160006] N80-27421
Elasticity theory of composites
[AD-A083173] N80-27431
Summary of the AFOSR/MSU Research Specialists Workshop on Coherent Structure in Turbulent Boundary Layers
[AD-A083717] N80-27637
Coronal heating by stochastic magnetic pumping
[NASA-CR-163356] N80-28287
STATE UNIV. OF NEW YORK, BUFFALO.
Modeling and investigation of periodic phenomena using techniques of time series analysis N80-28129
STATE UNIV. OF NEW YORK AT ALBANY.
Preliminary investigations of the electrical response of water surfaces during marine thunderstorms N80-27911
STATE UNIV. OF NEW YORK AT BUFFALO.
High capacity low delay packet broadcasting multiaccess schemes for satellite repeater systems N80-27548
Current conduction mechanism and design optimization study of MIS solar cells N80-27796
Harmonic analysis of feedbacks: A transfer function climate model N80-27954
The independence of control structures in abstract programming systems N80-28084
Measurements of the temperature dependent diamagnetism of liquids N80-28147
MHD channel flow and heat transfer in a time-dependent spatially varying magnetic field N80-28183
SYRACUSE UNIV., N. Y.
Computer programs for electromagnetic transmission through a filled slit of arbitrary cross section in a conducting plane of finite thickness
[AD-A084352] N80-27570
SYSTEMS CONTROL, INC., PALO ALTO, CALIF.
West Coast LORAN-C flight test
[AD-A084039] N80-27307
SYSTEMS CONTROL, INC., WEST PALM BEACH, FLA.
The integration of area navigation and the microwave landing system N80-27337

T

TECHNICAL UNIV. OF DENMARK, LYNGBY.
Investigation of heat storages with salt hydrate as storage medium based on the extra water principle
[EUR-6646-PT-2] N80-27818

TECHNISCHE HOGESCHOOL, DELFT (NETHERLANDS).
An effective probabilistic simulation of the turbulent flow and combustion in axisymmetric furnaces N80-27390

TECHNISCHE UNIV., BERLIN (WEST GERMANY).
A discussion of probe effects and improved measuring techniques in the near-wall region of an incompressible three-dimensional turbulent boundary layer N80-27657

TECHNISCHE UNIVERSITAET, MUNICH (WEST GERMANY).
Water vapor in the upper troposphere and in the stratosphere N80-27753

TECHNOLOGY SERVICE CORP., SANTA FE, N. MEX.
Empirical studies of the relationships between emissions and visibility in the Southwest
[PB80-156136] N80-27904

TEMPLE UNIV., PHILADELPHIA, PA.
On probability distributions involving the Stirling numbers N80-28130

TENNESSEE UNIV., KNOXVILLE.
Research on numerical algorithms for the three dimensional Navier-Stokes equations. 1: Accuracy, convergence and efficiency
[AD-A083664] N80-27633

TENNESSEE VALLEY AUTHORITY, CHATTANOOGA.
Investigations of coal-oil mixtures as a utility boiler light-off fuel N80-27501
Coal/oil/water mixture stability, appendix A N80-27502

TEXAS A&M UNIV., COLLEGE STATION.
Composite materials for structural design
[AD-A083721] N80-27433
Sonar probing as a mining and tunneling tool
[PB80-159239] N80-27790
ONESAM, a computer program for nonparametric data analysis and density quantile estimation
[AD-A084259] N80-28077
Modern empirical statistical spectral analysis
[AD-A084142] N80-28120
On the periodicities of Saturn's reflectivity in the visible N80-28282

TEXAS CHRISTIAN UNIV., FORT WORTH.
Wavefront reproduction by stimulated Brillouin and Raman scattering N80-27685

TEXAS DEPT. OF WATER RESOURCES, AUSTIN.
Ground-water resources and model applications for the Edwards (Balcones Fault Zone) Aquifer in the San Antonio Region, Texas
[PB80-157332] N80-27787

TEXAS INSTRUMENTS, INC., DALLAS.
IC Ku-Band impatt amplifier
[NASA-CR-160004] N80-27601

TEXAS TRANSPORTATION INST., COLLEGE STATION.
Performance of open-graded friction courses
[PB80-162985] N80-27531
Flexible pavement deflection equation using elastic moduli and field measurements
[PB80-159247] N80-27542

TEXAS UNIV., AUSTIN.
Observations of emission lines in M supergiants
[NASA-CR-163359] N80-28271

TEXAS UNIV. AT AUSTIN.
Residual stress measurements on aluminum--graphite composite using X-ray diffraction techniques
[AD-A083795] N80-27437
Complexity and computability of solutions to linear programming systems
[AD-A084682] N80-28076
Generalized network approaches for solving least absolute value and Tchebycheff regression problems
[AD-A084284] N80-28121
A primal simplex variant for the maximum flow problem
[AD-A084282] N80-28145
Solution approaches for network flow problems with multiple criteria
[AD-A084283] N80-28146

THESSALONIKI UNIV. (GREECE).
Proposal for an earthquake prediction project in northern Greece N80-27881

THOMSON-CSF, ARCUEIL (FRANCE).
SINTAC-C TMA: Application of SINTAC-C in the terminal area, during landing and ground taxiing N80-27338

TRANSPORTATION RESEARCH BOARD, WASHINGTON, D.C.
Aerial surveys, geometrics, surface drainage, ecological impacts and safety appurtenances
[PB80-162233] N80-28257

TRANSPORTATION SYSTEMS CENTER, CAMBRIDGE, MASS.
General aviation pilot and aircraft activity survey, conducted in 1978
[AD-A081726] N80-27276
FAA/NASA Proceedings Workshop on Wake Vortex Alleviation and Avoidance
[NASA-CR-163317] N80-27285
Chicago monostatic acoustic vortex sensing system. Volume 1: Data collection and reduction
[AD-A076929] N80-27306
Analysis of expandability and modifiability of computer configuration concepts for ATC. Volume 1: Distributed concept
[AD-A084045] N80-27314
An investigation of laser lighting systems to assist aircraft landing
[AD-A077722] N80-27315
Tests of an ATCRBS based trilateration sensor at Logan International Airport
[AD-A078979] N80-27316
Enhanced Terminal Information Services (ETIS) utilizing the Discrete Address Beacon System (DABS) data link-concept description
[AD-A073205] N80-27319
Theoretical feasibility of digital communication over ocean areas by high frequency radio
[AD-A079424] N80-27568

TRIESTE UNIV. (ITALY).
Feasibility study for the teletransmission of data from geophysical network installed in a seismic area to an operational center N80-27878
The feasibility study for absolute measurement monitoring of gravity field variations, connected with internal mass variation N80-27879

TRW DEFENSE AND SPACE SYSTEMS GROUP, REDONDO BEACH, CALIF.
Cost/benefit analysis of reentry vehicle hardness testing using the FAST methodology. Volume 2: Methods
[AD-A083336] N80-27420

TSINGHUA UNIV., BEIJING (CHINA).
Preliminary considerations of the use of COM in the experimental power plant of Tsinghua University as an energy fuel N80-27497

U

UNITED TECHNOLOGIES CORP., WINDSOR LOCKS, CONN.
Influence of noise reduction on weight and cost of general aviation propellers
[AD-A082120] N80-27366

UNITED TECHNOLOGIES RESEARCH CENTER, EAST HARTFORD, CONN.
Conceptual design study for Coherent Anti-Stokes Raman Spectroscopy (CARS) diagnostics in the AMMRC ballistic compressor facility
[AD-A083492] N80-27453

UNIVERSAL ENERGY SYSTEMS, INC., DAYTON, OHIO.
Electron spectroscopic studies of surfaces and intersurfaces for adhesive bonding
[AD-A084254] N80-27492

UNIVERSITE DES SCIENCES ET TECHNIQUES DE LILLE (FRANCE).
Radiative transfer in the cloudy and dusty atmosphere N80-27743

UNIVERSITE LAVAL (QUEBEC).
Combustion modelling within gas turbine engines, some applications and limitations N80-27394

UNIVERSITY COLL., LONDON (ENGLAND).
Global wind determination by interferometric techniques in the troposphere stratosphere and mesosphere N80-27759

UNIVERSITY COLL. OF NORTH WALES, BANGOR.
A study of the nature and origins of pyroelectricity in polyvinylidenefluoride and its co-polymers
[AD-A084448] N80-27490

UNIVERSITY OF CENTRAL FLORIDA, ORLANDO.
A continuation of base-line studies for environmentally monitoring space transportation systems at John F. Kennedy Space Center. Executive summary
[NASA-CR-163122] N80-27836

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES.
Coherent structures in turbulent boundary layers N80-27670

UTAH STATE UNIV., LOGAN.
Development of a small rocket system for conductivity measurements in the high latitude disturbed D-region in support of ELF/VLF propagation studies
[AD-A083331] N80-27897

UTAH UNIV., SALT LAKE CITY.
A cylindrical cloud model for microwave and infrared radiative transfer-applications to defense meteorological satellite program microwave sounders N80-27912
Transient acoustic wave propagation in an Epstein duct
[AD-A083484] N80-28160

V

VARIAN ASSOCIATES, PALO ALTO, CALIF.
Noncoplanar high power FET
[AD-A083682] N80-27607
Contiguous gridded gun development program
[AD-A084046] N80-27608

VERCHRON SYSTEMS, SALINE, MICH.
Distributed sensor systems and electromechanical analog facility
[AD-A084656] N80-28060

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG.
The 1H and 13C Fourier transform NMR characterization of jet fuels derived from alternated energy sources
[AD-A084169] N80-27513
Multicharacteristic quality control: A survey
[AD-A083894] N80-27708
An investigation of wind loads on solar collectors. Appendix 2: Net pressure coefficients
[PB80-158769] N80-27829
Random coverage of a circle with application to a shadowing problem
[AD-A084357] N80-28139

VIRGINIA UNIV., CHARLOTTESVILLE.
Analysis of computational methods for nonlinear parabolic differential systems
[AD-A084236] N80-28122

VON KARMAN INST. FOR FLUID DYNAMICS, RHODE-SAINT-GENESE (BELGIUM).
A prediction model for turbulent diffusion flames including NO-formation N80-27375

VOUGHT CORP., DALLAS, TEX.
Investigation of application parameters and testing of rain erosion coatings
[AD-A083578] N80-27430

W

WASHINGTON STATE UNIV., PULLMAN.
The fate and behavior of fuel-sulfur in combustion systems N80-27422

WASHINGTON UNIV., SEATTLE.
Effect of some structural parameters on elastic rotor loads by an iterative harmonic balance N80-27348
Beta decomposition in binary Ti-Cr alloys N80-27485
The biosynthesis of natural rubber and other hydrocarbon polymers N80-27482
Modeling and analysis of switched interconnection networks N80-27594
Multiple scattering effects on transmission through the atmosphere
[AD-A083615] N80-27896
Gas surface vibrational energy transfer in the transient region of a low pressure unimolecular reaction
[AD-A083944] N80-28189
Access path optimization in multidimensionally accessed database files N80-28234

WATER RESOURCES COUNCIL, WASHINGTON, D.C.
Options to improve federal nonstructural response to floods
[PB80-160146] N80-27792
Improved formulation and evaluation of nonstructural elements for water resources plans in flood hazard areas
[PB80-160120] N80-27793
WATKINS AND ASSOCIATES, LEXINGTON, KY.
Assessment of the environmental compatibility of differing helicopter noise certification standards
[AD-A080525] N80-28153
WEST VIRGINIA UNIV., MORGANTOWN.
Functional polymers for removal of heavy-metal Pollutants from water
[PB80-158215] N80-27846
WESTINGHOUSE RESEARCH AND DEVELOPMENT CENTER, PITTSBURGH, PA.
Theory and design of electrical rotating machinery
[AD-A083499] N80-27604
Programmable assembly research technology transfer to industry, phase 2
[PB80-164809] N80-28261
WICHITA STATE UNIV., KANS.
Feasibility study of aileron and spoiler control systems for large horizontal axis wind turbines
[NASA-CR-159856] N80-27803
WISCONSIN UNIV. - MADISON.
Evolution of deflagration in a cold combustible subjected to a uniform energy flux
[AD-A083822] N80-27461
Programming language facilities for numerical computation
[AD-A083815] N80-28069
On homogeneity and on-line-off-line behavior in M/G/1 queueing systems
[AD-A083827] N80-28090
Computer calculation of mechanisms involving intermittent motions
[AD-A083809] N80-28098
The Boltzman equation with a soft potential. Part 2: Nonlinear, spatially-periodic
[AD-A083813] N80-28099
Forced oscillations of nonlinear Hamiltonian systems, 2
[AD-A083812] N80-28100
High order difference methods for quasilinear elliptic boundary value problems on general regions
[AD-A083824] N80-28102
A simple derivation of Glassman's general N fast Fourier transform
[AD-A083811] N80-28104
Convergent approximations in parabolic variationally inequalities. 1: One phase Stefan problems
[AD-A083814] N80-28105
Equilibria of the curvature functional and manifolds of nonlinear interpolating spline curves
[AD-A083807] N80-28106
A nonlinear Volterra equation in variable domain
[AD-A083829] N80-28107
Contingent derivatives of set-valued maps and solutions to nonlinear inclusions and differential inclusions
[AD-A083826] N80-28108
Optimal simplex tableau characterization of unique and bounded solutions of linear programs
[AD-A083816] N80-28109
New algorithms for nonlinear least squares and Bayesian parameter estimation
[AD-A083819] N80-28110
Moving weighted average smoothing extended to the extremities of the data, revision
[AD-A083808] N80-28111
Singularly perturbed equations in the critical case
[AD-A083821] N80-28133
WISCONSIN UNIV. - MILWAUKEE.
Coincident bifurcation of equilibrium and periodic solutions of evolution equations
[AD-A083810] N80-28101
WOODARD-CLYDE CONSULTANTS, SAN FRANCISCO, CALIF.
Dewatering systems for surface coal mines
[PB80-160153] N80-27789
WORLD METEOROLOGICAL ORGANIZATION, GENEVA (SWITZERLAND).
Climate and climate modeling N80-27734
Climate Models: Performance, intercomparison and sensitivity studies, volume 1
[GARP-PUBL-22-VOL-1] N80-27917
Climate models: Performance, intercomparison and sensitivity studies, Volume 2
[GARP-PUBL-22-VOL-2] N80-27938
WRIGHT STATE UNIV., DAYTON, OHIO.
Coherent structures in time dependent shear flows N80-27652
WYLE LABS., INC., EL SEGUNDO, CALIF.
Correction procedures for aircraft noise data. Volume 1: Pseudotones
[AD-A081962] N80-28157
Correction procedures for aircraft noise data. Volume 2: Background noise considerations
[AD-A082011] N80-28158
WYOMING UNIV., LARAMIE.
Fatigue behavior of Hercules 3501-6 epoxy resin
[AD-A083494] N80-27487
Infrared studies of AFGL sources
[AD-A084713] N80-28274

X

XEROX ELECTRO-OPTICAL SYSTEMS, PASADENA, CALIF.
Inert gas ion thruster development
[NASA-CR-159805] N80-27424

Y

YALE UNIV., NEW HAVEN, CONN.
Equilibrium climatic zonation deduced from a statistical-dynamical model N80-27945
A simple sea-ice/ocean-temperature oscillator model N80-27951

Z

ZENTRALANSTALT FUER METEOROLOGIE UND GEODYNAMIK, VIENNA (AUSTRIA).
Mountain overflow phenomena in satellite imagery N80-27754

CONTRACT NUMBER INDEX

Typical Contract Number Index Listing

DEN3-61 ..... N80-16493

CONTRACT NUMBER — NASA ACCESSION NUMBER

Listings in this index are arranged alphanumerically by contract number. Under each contract number the NASA accession numbers denoting documents that have been produced as a result of research done under that contract are arranged in ascending order. The NASA accession number denotes the number by which the citation is identified.

REPORT/ACCESSION NUMBER INDEX

Typical Report/Accession Number Index Listing

Listings in this index are arranged alphanumerically by report number. The NASA accession number denotes the number by which the citation is identified. An asterisk (*) indicates that the item is a NASA report. A pound sign (#) indicates that the item is available on microfiche.

PUBLIC COLLECTIONS OF NASA DOCUMENTS

DOMESTIC

NASA distributes its technical documents and bibliographic tools to eleven special libraries located in the organizations listed below. Each library is prepared to furnish the public such services as reference assistance, interlibrary loans, photocopy service, and assistance in obtaining copies of NASA documents for retention.

CALIFORNIA
University of California, Berkeley

COLORADO
University of Colorado, Boulder

DISTRICT OF COLUMBIA
Library of Congress

GEORGIA
Georgia Institute of Technology, Atlanta

ILLINOIS
The John Crerar Library, Chicago

MASSACHUSETTS
Massachusetts Institute of Technology, Cambridge

MISSOURI
Linda Hall Library, Kansas City

NEW YORK
Columbia University, New York

OKLAHOMA
University of Oklahoma, Bizzell Library

PENNSYLVANIA
Carnegie Library of Pittsburgh

WASHINGTON
University of Washington, Seattle

NASA publications (those indicated by an "*" following the accession number) are also received by the following public and free libraries.

CALIFORNIA
Los Angeles Public Library
San Diego Public Library

COLORADO
Denver Public Library

CONNECTICUT
Hartford Public Library

MARYLAND
Enoch Pratt Free Library, Baltimore

MASSACHUSETTS
Boston Public Library

MICHIGAN
Detroit Public Library

MINNESOTA
Minneapolis Public Library

MISSOURI
Kansas City Public Library
St. Louis Public Library

NEW JERSEY
Trenton Public Library

NEW YORK

Buffalo and Erie County Public Library
Rochester Public Library
New York Public Library

OHIO
Akron Public Library
Cincinnati Public Library
Cleveland Public Library
Dayton Public Library
Toledo Public Library

TENNESSEE
Memphis Public Library

TEXAS
Dallas Public Library
Fort Worth Public Library

WASHINGTON
Seattle Public Library

WISCONSIN
Milwaukee Public Library

An extensive collection of NASA and NASA-sponsored documents and aerospace publications available to the public for reference purposes is maintained by the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

EUROPEAN

An extensive collection of NASA and NASA-sponsored publications is maintained by the British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. By virtue of arrangements other than with NASA, the British Library Lending Division also has available many of the non-NASA publications cited in *STAR*. European requesters may purchase facsimile copy of microfiche of NASA and NASA-sponsored documents, those identified by both the symbols "#" and "*", from: ESA Information Retrieval Service, European Space Agency, 8-10 rue Mario-Nikis, 75738 Paris CEDEX 15, France.

NAS 1.9/4

WHAT YOU CAN DO FOR *STAR*

All users of this abstract service are urged to forward reports to be considered for announcement in *STAR*. This will aid NASA in its efforts to provide the fullest possible coverage of all scientific and technical publications that might support aeronautics and space research and development. If you have prepared relevant reports (other than those that you will transmit to NASA, DoD, or DOE through the usual contract- or grant-reporting channels), please send them for consideration to the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

Reprints of journal articles, book chapters, and conference papers are also welcome. These will be considered for announcement in *STAR's* companion journal, *International Aerospace Abstracts*.

You may specify a particular source to be included in a report announcement if you wish; otherwise the report will be placed on public sale at the National Technical Information Service. Copyrighted publications will be announced but not distributed or sold.

PURCHASE OF *STAR*

The semimonthly issues and the cumulative index issues are available postpaid on subscription and in single copy from the Superintendent of Documents, United States Government Printing Office, Washington, D.C., 20402, United States of America.

Semimonthly issues

Annual subscription rates: $60.00 domestic; $75.00 foreign. Price per single copy: $2.50 domestic; $3.15 foreign.

Cumulative index issues, semiannual and annual

Annual subscription rates for both: $25.00 domestic; $31.25 foreign. Price per single copy: semiannual $9.50 domestic, $11.90 foreign; annual $16.00 domestic, $20.00 foreign.

Domestic subscription rates

Apply to the United States, Canada, Mexico, and all Central and South American countries, except as noted below.

Foreign subscription rates

Apply to Argentina, Brazil, French Guiana, Guyana, Surinam, Belize, and all other countries throughout the world.

Payment should be by check, money order, or document coupons, and must accompany order. Remittances from foreign countries should be made by international money order or draft on an American bank, payable to the Superintendent of Documents, or by UNESCO book coupons.

PUBLISHED BY:

UNITED STATES GOVERNMENT
NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
SCIENTIFIC AND TECHNICAL INFORMATION BRANCH

Scientific and Technical Aerospace Reports, Volume 18, is prepared by the NASA Scientific and Technical Information Facility operated for the National Aeronautics and Space Administration by PRC Data Services Company.

The Administrator of the National Aeronautics and Space Administration has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Agency. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through June 30, 1981.

US ISSN 0036-8741

INTRODUCTION

Scientific and Technical Aerospace Reports (STAR) is a major component of a comprehensive National Aeronautics and Space Administration information system covering aeronautics, space, and supporting disciplines. *STAR* is issued on the 8th and 23rd of each month and announces current publications of the following types:

- NASA, NASA contractor, and NASA grantee reports
- Reports issued by other U.S. Government agencies, domestic and foreign institutions, universities, and private firms
- Translations in report form
- NASA-owned patents and patent applications
- Dissertations and theses

NEWARK PUBLIC LIBRARY

OCT 28 1980

U. S. GOVT. PUBS.
DEPOSITORY 376

Cumulative index volumes are published semiannually and annually.

Journal, book, and conference literature, cover-to-cover journal translations, and certain foreign dissertations are announced in a companion journal, *International Aerospace Abstracts (IAA)*, available on subscription from the American Institute of Aeronautics and Astronautics, Technical Information Service, 555 West 57th Street, 12th Floor, New York, New York 10019.

ON-GOING RESEARCH PROJECTS

By arrangement between NASA and the Smithsonian Science Information Exchange (SSIE), a separate section of information on aerospace-related *On-Going Research Projects* is inserted into each issue of *STAR*. The insert presents titles of active NASA grants and university contracts, summary portions of recently updated *NASA Research and Technology Objectives and Plans (RTOPs)*, and notices of non-NASA research projects that were funded in the most recent or current fiscal year. The latter are selected by SSIE. The project announcements in the insert are arranged by *STAR* divisions but are otherwise entirely separate from *STAR*. They are not indexed nor machine-searchable by NASA. Current and retrospective searches are available from SSIE, 1730 M Street, N.W., Washington, D.C. 20036.

SUBJECT SCOPE

Subject scope of *STAR*, *IAA*, and *On-Going Research Projects* includes all aspects of aeronautics and space research and development, supporting basic and applied research, and applications. Aerospace aspects of earth resources, energy development, conservation, oceanography, environmental protection, urban transportation, and other topics of high national priority are also covered.

OTHER NASA PUBLICATIONS

Other NASA publications and information services are described in the publication, *The NASA Scientific and Technical Information System ... and How to Use It*, available without charge from the NASA Scientific and Technical Information Facility, P. O. Box 8757, B. W. I. Airport, Maryland 21240.

HOW TO USE STAR SUBJECT CATEGORIES

STAR is categorized by 10 major subject divisions divided into 74 specific subject categories and one general category/division. The major subject divisions are listed in the Table of Contents, together with a note for each that defines its scope and provides any cross-references. For example:

AERONAUTICS

Includes aeronautics (general), aerodynamics, air transportation and safety, aircraft communications and navigation, aircraft design, testing and performance, aircraft instrumentation, aircraft propulsion and power, aircraft stability and control, and research and support facilities (air).

For related information see also *Astronautics*.

Each major division is further divided into as many as nine specific categories, which are identified by category numbers.

Abstracts in *STAR* are grouped by specific category, the categories appearing in sequential order. Category breaks in the abstract section are identified by the category number and title, and a scope note. Cross-references to other categories are provided as appropriate. For example:

02 AERODYNAMICS

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces, and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

CROSS-REFERENCES

Individual *STAR* abstracts are not ordinarily cross-referenced, except for certain conference reports or book translations that have had separate abstracts written for their component papers or chapters. Citations and abstracts of the components follow immediately after those of the parent document. When the subject content of a component differs sufficiently from the general content of the parent, a cross-reference citation also is printed at the end of the category to which it normally would have been assigned if it were independent.

DOCUMENTS ON MICROFICHE

Documents on microfiche[1] are designated by a pound sign (#) following the accession number. The pound sign is used without regard to the source or quality of the microfiche.

AVAILABILITIES

One or more sources from which a document announced in *STAR* is available to the public is given in each citation. The most commonly indicated sources and their acronyms or abbreviations are listed below. If the publication is available from a source other than those listed, the publisher and his address will be displayed on the availability line or in combination with the corporate source line.

(1) A microfiche is a transparent sheet of film, 105 by 148 mm in size, containing as many as 60 to 98 pages of information reduced to micro images (not to exceed 26 1 reduction).

Avail: NTIS. Sold by the National Technical Information Service. Prices for hard copy (HC) and microfiche (MF) are indicated by a price code following the letters HC or MF in the *STAR* citation. Current values for the price codes are given in the tables on page vii.

Initially distributed microfiche under the NTIS SRIM (Selected Research in Microfiche) is available at greatly reduced unit prices. For this service and for information concerning subscription to NASA printed reports, consult the NTIS Subscription Section, Springfield, Va. 22161.

NOTE ON ORDERING DOCUMENTS: When ordering NASA publications (those followed by the * symbol), use the N accession number. NASA patent applications (only the specifications are offered) should be ordered by the US-Patent-Appl-SN number. Non-NASA publications (no asterisk) should be ordered by the AD, PB, or other *report* number shown on the last line of the citation, not by the N accession number. It is also advisable to cite the title and other bibliographic identification.

Avail: SOD (or GPO). Sold by the Superintendent of Documents, U.S. Government Printing Office, in hard copy. The current price and order number are given following the availability line. (NTIS will fill microfiche requests, at the standard $3.50 price, for those documents identified by a # symbol.)

Avail: NASA Public Document Rooms. Documents so indicated may be examined at or purchased from the National Aeronautics and Space Administration, Public Documents Room (Room 126), 600 Independence Ave., S.W., Washington, D.C. 20546, or public document rooms located at each of the NASA research centers, the NASA Space Technology Laboratories, and the NASA Pasadena Office at the Jet Propulsion Laboratory.

Avail: DOE Depository Libraries. Organizations in U.S. cities and abroad that maintain collections of Department of Energy reports, usually in microfiche form, are listed in *Energy Research Abstracts*. Services available from the DOE and its depositories are described in a booklet, *DOE Technical Information Center - Its Functions and Services* (TID-4660), which may be obtained without charge from the DOE Technical Information Center.

Avail: Univ. Microfilms. Documents so indicated are dissertations selected from *Dissertation Abstracts* and are sold by University Microfilms as xerographic copy (HC) and microfilm. All requests should cite the author and the Order Number as they appear in the citation.

Avail: USGS. Originals of many reports from the U.S. Geological Survey, which may contain color illustrations, or otherwise may not have the quality of illustrations preserved in the microfiche or facsimile reproduction, may be examined by the public at the libraries of the USGS field offices whose addresses are listed in this Introduction. The libraries may be queried concerning the availability of specific documents and the possible utilization of local copying services, such as color reproduction.

Avail: HMSO. Publications of Her Majesty's Stationery Office are sold in the U.S. by Pendragon House, Inc. (PHI), Redwood City, California. The U.S. price (including a service and mailing charge) is given, or a conversion table may be obtained from PHI.

Avail: BLL (formerly NLL): British Library Lending Division, Boston Spa, Wetherby, Yorkshire, England. Photocopies available from this organization at the price shown. (If none is given, inquiry should be addressed to the BLL.)

Avail: Fachinformationszentrum, Karlsruhe. Sold by the Fachinformationszentrum Energie, Physik, Mathematik GMBH, Eggenstein Leopoldshafen, Federal Republic of Germany, at the price shown in deutschmarks (DM).

Avail: Issuing Activity, or Corporate Author, or no indication of availability. Inquiries as to the availability of these documents should be addressed to the organization shown in the citation as the corporate author of the document.

Avail: U.S. Patent and Trademark Office. Sold by Commissioner of Patents and Trademarks, U.S. Patent and Trademark Office, at the standard price of 50 cents each, postage free. (See discussion of patents and patent applications below.)

NASA PATENTS AND PATENT APPLICATIONS

Patents and patent applications owned by NASA are announced in *STAR* under appropriate subject categories and are referenced in the *STAR* indexes. In the Report/Accession Number Index, patents are indexed by the NASA Case Number (which appears in lieu of the report number in other indexes), the U.S. Patent Number, the U.S. Patent Application Serial Number, and the U.S. Patent Class. Patent applications for which patents have not yet been issued are indexed by the NASA Case Number and the U.S. Patent Application Serial Number.

NASA *patent application specifications* are sold in paper copy by the National Technical Information Service at price code A02 ($5.00 domestic; $10.00 foreign). Microfiche are sold at price code A01 ($3.50 domestic; $5.25 foreign). The US-Patent-Appl-SN- number should be used in ordering either paper copy or microfiche from NTIS. Printed copies of *patents* (which are not microfiched) are available for purchase at 50 cents per copy from:

Commissioner of Patents and Trademarks
U.S. Patent and Trademark Office
Washington, D.C. 20231

When ordering patents, the U.S. Patent Number should be used, and payment must be remitted in advance, preferably by money order or check payable to the Commissioner of Patents and Trademarks. Prepaid purchase coupons for ordering are also available from the Patent and Trademark Office. The patents and patent applications announced in *STAR* are owned by NASA and are available for royalty-free licensing. Requests for licensing terms and further information should be addressed to:

Assistant General Counsel for Patent Matters/Code GP-1
National Aeronautics and Space Administration
Washington, D.C. 20546

ELIGIBILITY AND REGISTRATION FOR NASA INFORMATION PRODUCTS AND SERVICES

A variety of services, in addition to the distribution of NASA scientific and technical reports and of *STAR* and its cumulative indexes, is available to organizations of the following types that have registered with NASA to receive specific services or products:

1. NASA offices, research centers, contractors, subcontractors, grantees, and consultants;

2. Other U.S. Government agencies and their contractors;
3. Libraries in the United States that have arrangements with NASA to maintain collections of NASA documents for public reference;
4. Other organizations in the United States having a need for NASA documents in work related to aeronautics and space research;
5. Organizations abroad that have established reciprocal document exchange arrangements with NASA.

Only the central service points or central points of document acquisition and control within qualified organizations are eligible to register for NASA products and services. Domestic organizations that may be eligible to receive various classes of NASA publications and services should address their requests for registration or for further information to:

NASA Scientific and Technical Information Facility
Attn.: Registration Activity
P.O. Box 8757
B.W.I. Airport, Maryland 21240

Organizations abroad should direct requests to the same address, but to the attention of: International Exchange Program.

AVAILABILITY OF STAR ABSTRACTS ON MICROFICHE

Microfiche of the abstract sections of this issue ahd other issues of *STAR* are available on annual subscription from NTIS, Attn: Subscriptions, 5285 Port Royal Road, Springfield, Virginia 22161. Annual subscription rates are $45.00 North America; $90.00 foreign. Abstract sections for previous years retroactive to 1964 are available at the current rates. Microfiche for individual *STAR* issue abstract sections are not available.

VOLUME 18 NUMBER 19/OCTOBER 8, 1980

TABLE OF CONTENTS

AERONAUTICS

Includes aeronautics (general); aerodynamics; air transportation and safety; aircraft communications and navigation; aircraft design, testing and performance; aircraft instrumentation; aircraft propulsion and power; aircraft stability and control; and research and support facilities (air).

For related information see also *Astronautics*.

01 AERONAUTICS (GENERAL) 2513

02 AERODYNAMICS 2513

Includes aerodynamics of bodies, combinations, wings, rotors, and control surfaces; and internal flow in ducts and turbomachinery.

For related information see also *34 Fluid Mechanics and Heat Transfer*.

03 AIR TRANSPORTATION AND SAFETY 2517

Includes passenger and cargo air transport operations; and aircraft accidents.

For related information see also *16 Space Transportation* and *85 Urban Technology and Transportation*.

04 AIRCRAFT COMMUNICATIONS AND NAVIGATION 1518

Includes digital and voice communication with aircraft; air navigation systems (satellite and ground based); and air traffic control.

For related information see also *17 Spacecraft Communications, Command and Tracking* and *32 Communications*.

05 AIRCRAFT DESIGN, TESTING AND PERFORMANCE 1519

Includes aircraft simulation technology.

For related information see also *18 Spacecraft Design, Testing and Performance* and *39 Structural Mechanics*.

06 AIRCRAFT INSTRUMENTATION 2521

Includes cockpit and cabin display devices; and flight instruments.

For related information see also *19 Spacecraft Instrumentation* and *35 Instrumentation and Photography*.

07 AIRCRAFT PROPULSION AND POWER 2522

Includes prime propulsion systems and systems components, e.g., gas turbine engines and compressors; and on-board auxiliary power plants for aircraft.

For related information see also *20 Spacecraft Propulsion and Power*, *28 Propellants and Fuels*, and *44 Energy Production and Conversion*.

08 AIRCRAFT STABILITY AND CONTROL 2524

Includes aircraft handling qualities; piloting; flight controls; and autopilots.

09 RESEARCH AND SUPPORT FACILITIES (AIR) 2525

Includes airports, hangars and runways; aircraft repair and overhaul facilities; wind tunnels; shock tube facilities; and engine test blocks.

For related information see also *14 Ground Support Systems and Facilities (Space)*.

ASTRONAUTICS

Includes astronautics (general); astrodynamics; ground support systems and facilities (space); launch vehicles and space vehicles; space transportation; spacecraft communications, command and tracking; spacecraft design, testing and performance; spacecraft instrumentation; and spacecraft propulsion and power.

For related information see also *Aeronautics*.

12 ASTRONAUTICS (GENERAL) 2527

For extraterrestrial exploration see *91 Lunar and Planetary Exploration*.

13 ASTRODYNAMICS 2527

Includes powered and free-flight trajectories; and orbit and launching dynamics.

14 GROUND SUPPORT SYSTEMS AND FACILITIES (SPACE) 2529

Includes launch complexes, research and production facilities; ground support equipment, e.g., mobile transporters; and simulators.

For related information see also *09 Research and Support Facilities (Air)*.

15 LAUNCH VEHICLES AND SPACE VEHICLES 2529

Includes boosters; manned orbital laboratories; reusable vehicles; and space stations.

16 SPACE TRANSPORTATION 2530

Includes passenger and cargo space transportation, e.g., shuttle operations; and rescue techniques.

For related information see also *03 Air Transportation and Safety* and *85 Urban Technology and Transportation*.

17 SPACECRAFT COMMUNICATIONS, COMMAND AND TRACKING 2531

Includes telemetry; space communications networks; astronavigation; and radio blackout.

For related information see also *04 Aircraft Communications and Navigation* and *32 Communications*.

18 SPACECRAFT DESIGN, TESTING AND PERFORMANCE 2531

Includes spacecraft thermal and environmental control; and attitude control.

For life support systems see *54 Man/System Technology and Life Support*. For related information see also *05 Aircraft Design, Testing and Performance* and *39 Structural Mechanics*.

19 SPACECRAFT INSTRUMENTATION 2532
For related information see also *06 Aircraft Instrumentation* and *35 Instrumentation and Photography*.

20 SPACECRAFT PROPULSION AND POWER 2533
Includes main propulsion systems and components, e.g., rocket engines; and spacecraft auxiliary power sources.
For related information see also *07 Aircraft Propulsion and Power, 28 Propellants and Fuels,* and *44 Energy Production and Conversion*.

CHEMISTRY AND MATERIALS

Includes chemistry and materials (general); composite materials; inorganic and physical chemistry; metallic materials; nonmetallic materials; and propellants and fuels.

23 CHEMISTRY AND MATERIALS (GENERAL) 2534
Includes biochemistry and organic chemistry.

24 COMPOSITE MATERIALS 2534
Includes laminates.

25 INORGANIC AND PHYSICAL CHEMISTRY 2538
Includes chemical analysis, e.g., chromatography; combustion theory; electrochemistry; and photochemistry.
For related information see also *77 Thermodynamics and Statistical Physics*.

26 METALLIC MATERIALS 2542
Includes physical, chemical, and mechanical properties of metals, e.g., corrosion; and metallurgy.

27 NONMETALLIC MATERIALS 2546
Includes physical, chemical, and mechanical properties of plastics, elastomers, lubricants, polymers, textiles, adhesives, and ceramic materials.

28 PROPELLANTS AND FUELS 2548
Includes rocket propellants, igniters, and oxidizers; storage and handling; and aircraft fuels.
For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power,* and *44 Energy Production and Conversion*.

ENGINEERING

Includes engineering (general); communications; electronics and electrical engineering; fluid mechanics and heat transfer; instrumentation and photography; lasers and masers; mechanical engineering; quality assurance and reliability; and structural mechanics.
For related information see also *Physics*.

31 ENGINEERING (GENERAL) 2553
Includes vacuum technology; control engineering; display engineering; and cryogenics.

32 COMMUNICATIONS 2554
Includes land and global communications; communications theory; and optical communications.
For related information see also *04 Aircraft Communications and Navigation* and *17 Spacecraft Communications, Command and Tracking*.

33 ELECTRONICS AND ELECTRICAL ENGINEERING 2561
Includes test equipment and maintainability; components, e.g., tunnel diodes and transistors; microminiaturization; and integrated circuitry.
For related information see also *60 Computer Operations and Hardware* and *76 Solid-State Physics*.

34 FLUID MECHANICS AND HEAT TRANSFER 2566
Includes boundary layers; hydrodynamics; fluidics; mass transfer; and ablation cooling.
For related information see also *02 Aerodynamics* and *77 Thermodynamics and Statistical Physics*.

35 INSTRUMENTATION AND PHOTOGRAPHY 2569
Includes remote sensors; measuring instruments and gages; detectors; cameras and photographic supplies; and holography.
For aerial photography see *43 Earth Resources*. For related information see also *06 Aircraft Instrumentation* and *19 Spacecraft Instrumentation*.

36 LASERS AND MASERS 2571
Includes parametric amplifiers.

37 MECHANICAL ENGINEERING 2572
Includes auxiliary systems (non-power); machine elements and processes; and mechanical equipment.

38 QUALITY ASSURANCE AND RELIABILITY 2576
Includes product sampling procedures and techniques; and quality control.

39 STRUCTURAL MECHANICS 2576
Includes structural element design and weight analysis; fatigue; and thermal stress.
For applications see *05 Aircraft Design, Testing and Performance* and *18 Spacecraft Design, Testing and Performance*.

GEOSCIENCES

Includes geosciences (general); earth resources; energy production and conversion; environment pollution; geophysics; meteorology and climatology; and oceanography.
For related information see also *Space Sciences*.

42 GEOSCIENCES (GENERAL) 2580

43 EARTH RESOURCES 2580

Includes remote sensing of earth resources by aircraft and spacecraft; photogrammetry; and aerial photography.

For instrumentation see *35 Instrumentation and Photography*.

44 ENERGY PRODUCTION AND CONVERSION 2590

Includes specific energy conversion systems, e.g., fuel cells and batteries; global sources of energy; fossil fuels; geophysical conversion; hydroelectric power; and wind power.

For related information see also *07 Aircraft Propulsion and Power, 20 Spacecraft Propulsion and Power, 28 Propellants and Fuels*, and *85 Urban Technology and Transportation*.

45 ENVIRONMENT POLLUTION 2601

Includes air, noise, thermal and water pollution; environment monitoring; and contamination control.

46 GEOPHYSICS 2604

Includes aeronomy; upper and lower atmosphere studies; ionospheric and magnetospheric physics; and geomagnetism.

For space radiation see *93 Space Radiation*.

47 METEOROLOGY AND CLIMATOLOGY 2608

Includes weather forecasting and modification.

48 OCEANOGRAPHY 2610

Includes biological, dynamic and physical oceanography; and marine resources.

LIFE SCIENCES

Includes life sciences (general); aerospace medicine; behavioral sciences; man/system technology and life support; and planetary biology.

51 LIFE SCIENCES (GENERAL) 2611

Includes genetics.

52 AEROSPACE MEDICINE 2612

Includes physiological factors; biological effects of radiation; and weightlessness.

53 BEHAVIORAL SCIENCES 2615

Includes psychological factors; individual and group behavior; crew training and evaluation; and psychiatric research.

54 MAN/SYSTEM TECHNOLOGY AND LIFE SUPPORT 2615

Includes human engineering; biotechnology; and space suits and protective clothing.

55 PLANETARY BIOLOGY N.A.

Includes exobiology; and extraterrestrial life.

MATHEMATICAL AND COMPUTER SCIENCES

Includes mathematical and computer sciences (general); computer operations and hardware; computer programming and software; computer systems; cybernetics; numerical analysis; statistics and probability; systems analysis; and theoretical mathematics.

59 MATHEMATICAL AND COMPUTER SCIENCES (GENERAL) N.A.

60 COMPUTER OPERATIONS AND HARDWARE 2616

Includes computer graphics and data processing.

For components see *33 Electronics and Electrical Engineering*.

61 COMPUTER PROGRAMMING AND SOFTWARE 2617

Includes computer programs, routines, and algorithms.

62 COMPUTER SYSTEMS 2618

Includes computer networks.

63 CYBERNETICS 2619

Includes feedback and control theory.

For related information see also *54 Man/System Technology and Life Support*.

64 NUMERICAL ANALYSIS 2620

Includes iteration, difference equations, and numerical approximation.

65 STATISTICS AND PROBABILITY 2621

Includes data sampling and smoothing; Monte Carlo method; and stochastic processes.

66 SYSTEMS ANALYSIS 2622

Includes mathematical modeling; network analysis, and operations research.

67 THEORETICAL MATHEMATICS 2622

Includes topology and number theory.

PHYSICS

Includes physics (general); acoustics; atomic and molecular physics; nuclear and high-energy physics; optics; plasma physics; solid-state physics; and thermodynamics and statistical physics.

For related information see also *Engineering*.

70 PHYSICS (GENERAL) 2622

For geophysics see *46 Geophysics*. For astrophysics see *90 Astrophysics*. For solar physics see *92 Solar Physics*.

71 ACOUSTICS 2627
Includes sound generation, transmission, and attenuation.
For noise pollution see *45 Environment Pollution*.

72 ATOMIC AND MOLECULAR PHYSICS 2628
Includes atomic structure and molecular spectra.

73 NUCLEAR AND HIGH-ENERGY PHYSICS 2629
Includes elementary and nuclear particles; and reactor theory.
For space radiation see *93 Space Radiation*.

74 OPTICS 2631
Includes light phenomena.

75 PLASMA PHYSICS 2632
Includes magnetohydrodynamics and plasma fusion.
For ionospheric plasmas see *46 Geophysics*. For space plasmas see *90 Astrophysics*.

76 SOLID-STATE PHYSICS 2635
Includes superconductivity.
For related information see also *33 Electronics and Electrical Engineering* and *36 Lasers and Masers*.

77 THERMODYNAMICS AND STATISTICAL PHYSICS 2637
Includes quantum mechanics; and Bose and Fermi statistics.
For related information see also *25 Inorganic and Physical Chemistry* and *34 Fluid Mechanics and Heat Transfer*.

SOCIAL SCIENCES

Includes social sciences (general); administration and management; documentation and information science; economics and cost analysis; law and political science; and urban technology and transportation.

80 SOCIAL SCIENCES (GENERAL) N.A.
Includes educational matters.

81 ADMINISTRATION AND MANAGEMENT 2637
Includes management planning and research.

82 DOCUMENTATION AND INFORMATION SCIENCE 2637
Includes information storage and retrieval technology; micrography; and library science.
For computer documentation see *61 Computer Programming and Software*.

83 ECONOMICS AND COST ANALYSIS 2638
Includes cost effectiveness studies.

84 LAW AND POLITICAL SCIENCE N.A.
Includes space law; international law; international cooperation; and patent policy.

85 URBAN TECHNOLOGY AND TRANSPORTATION 2638
Includes applications of space technology to urban problems; technology transfer; technology assessment; and surface and mass transportation.
For related information see *03 Air Transportation and Safety*, *16 Space Transportation*, and *44 Energy Production and Conversion*.

SPACE SCIENCES

Includes space sciences (general); astronomy; astrophysics; lunar and planetary exploration; solar physics; and space radiation.
For related information see also *Geosciences*.

88 SPACE SCIENCES (GENERAL) N.A.

89 ASTRONOMY 2639
Includes radio and gamma-ray astronomy; celestial mechanics; and astrometry.

90 ASTROPHYSICS 2639
Includes cosmology; and interstellar and interplanetary gases and dust.

91 LUNAR AND PLANETARY EXPLORATION 2640
Includes planetology; and manned and unmanned flights.
For spacecraft design see *18 Spacecraft Design, Testing and Performance*. For space stations see *15 Launch Vehicles and Space Vehicles*.

92 SOLAR PHYSICS 2640
Includes solar activity, solar flares, solar radiation and sunspots.

93 SPACE RADIATION 2641
Includes cosmic radiation; and inner and outer earth's radiation belts.
For biological effects of radiation see *52 Aerospace Medicine*. For theory see *73 Nuclear and High-Energy Physics*.

AUTHOR → D. J. Mourey 3 Sep. 1979 409 p. refs

AVAILABILITY SOURCE

CONTRACT OR GRANT → (Contract NAS1-15624)

REPORT NUMBER → (NASA-CR-159149) Avail: NTIS HC A18/MF A01

CSCL 01C ← COSATI CODE

The aspects of flight testing an aeroelastically tailored forward swept research wing on a BQM-34F drone vehicle are examined. The geometry of a forward swept wing, which is incorporated into the BQM-34F to maintain satisfactory flight performance, stability, and control is defined. A preliminary design of the aeroelastically tailored forward swept wing is presented.

ON-GOING RESEARCH PROJECTS

This is a listing of research projects - not publications

AERONAUTICS

Includes Aeronautics (general); Aerodynamics; Air Transportation and Safety; Aircraft Communications and Navigation; Aircraft Design, Testing, and Performance; Aircraft Instrumentation; Aircraft Propulsion and Power; Aircraft Stability and Control; and Research and Support Facilities (air). For Related Information See Also Astronautics.

1.0001, AIRCRAFT/STORE INTERFACE TECHNOLOGY
C.M. Connell, U.S. Dept. of Defense, Air Force, Armament Lab., *Eglin Air Force Base, Florida* 32542 (DF646990)

Air Force function - standard aircraft/store electrical interfaces. Deficiency - currently, there is little aircraft/store electrical interoperability. Electrical interfaces are designed on a case-by-case basis with little resulting standardization. Objective - generate the technology required to apply new multiplexing techniques to future aircraft/store interfaces. How work contributes - the results of this effort will contribute to the design of a standard aircraft/store interface. This interface, when implemented, can remove one of the major obstacles to interoperability between aircraft and stores.

Problems inherent in a multiplexed interface will be studied and solutions proposed. Promising interfacing concepts will be investigated by developing hardware and software in-house for simulations and applications analyses. Fiber optics, microprocesser, VLSI and NEXTED BUS concepts will be implemented and tested.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Armament Lab.

1.0002, NONLINEAR INTERFERENCE DETECTION
T.E. Baustert, U.S. Dept. of Defense, Air Force, Rome Air Development Center, *Griffiss Air Force Base, Rome, New York* 13441 (DF930370)

The objective of this in-house effort is to determine and extend the current state-of-the-art in hardware and measurement techniques capable of locating the sources of nonlinear interference generators on-board CCC aircraft.

The approach to be taken will include a literature search to determine what has been done by the DOD and industry in the area of locating nonlinear generators of interference. A hand-held sensitive field intensity meter is being procured for test and evaluation. If necessary, the unit will be modified to improve its sensitivity and selectivity. Once a suitable piece of hardware is available, measurements will be performed on vehicles and aircraft for the purpose of developing suitable measurement techniques.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Rome Air Development Center

1.0003, WORKLOAD PROBLEM ASSESSMENT
L.C. Butterbaugh, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF142930)

This effort supports the test and evaluation function of the Air Force. Advancements in crew station technology and mission concepts has significantly altered the crew workload associated with performing a mission. Existing technical means of assessing crew workload have not kept pace with the changes in workload. The objective of this effort is to maintain a working level familiarity with workload assessment technology and investigate potential methodologies relative to workload measurement and prediction. Such knowledge will provide the necessary understanding of operational crew workload problems and identify crew system interface areas requiring study. More efficient pursuit of workload assessment methodologies will be realized.

Literature searches of technical libraries and review of aircraft accident reports. Pilot opinion survey of aircrews in the operational commands (TAC, SAC, MAC, etc.). Promising workload assessment methodologies will be previewed for feasibility through limited-effort investigations conducted within the branch.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0004, STORE SEPARATION METHODOLOGY INVESTIGATION AND IMPROVEMENT
C.L. Dyer, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144150)

Part of the Air Force's mission is to deliver ordnance safely and accurately. The opportunity exists to enhance the utility of contractor developed store separation prediction programs. The objective of work to be performed is to provide an extensively validated design tool to assess the effects of store separation on aircraft safety and to predict the initial perturbations of stores as they are being separated from aircraft. This work will have a payoff in reducing self-inflicted damage from stores and in reducing cost associated with flight and wind tunnel tests in store certification programs, and it will allow store separation to be factored into design of both stores and aircraft.

The approach will be to exercise methods developed under contract and to compare their predictions with existing wind tunnel and flight test data. These comparisons will point out places where methods need improvement, and through the process of making comparisons it will become apparent where the methods could be implemented in a much more user oriented way. These improvements will be accomplished in-house if at all possible.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0005, STABILITY AND CONTROL DATA DISCREPANCIES IDENTIFICATION
S.F. Lash, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143300)

This work unit supports TPO 3, flight control, and major thrust FG02D3, aircraft stability and control prediction. Specifically, it addresses the problem area involving the differences observed between predicted and actual flight characteristics. The objective of this effort is to identify discrepancies observed during aircraft development programs between predicted values of stability and control parameters and those measured in flight. The results of this effort will be used to formulate a specific investigation of the test and analysis methods used to predict stability and control characteristics, which, will result in a more accurate mathematical representation of predicted aircraft dynamics.

Information will be obtained on several recent and ongoing aircraft development programs to identify situations where values of the stability and control parameters used for dynamic analysis and piloted simulation have led to misleading estimates

of actual flight characteristics. Following problem identification and selection, aerodynamic data, piloted simulation time histories, flight test time histories, and operational experience will be evaluated to document discrepancies.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0006, FLAT PANEL SELF-HEALING VERTICAL SITUATION DISPLAY
J.R. Pastor, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF144540)

This work unit supports TP03. Criteria is required which defines a font set and sizes which will be fail-safe and fail-redundant with a specified level of probability due to pilot perception. The objective is to establish this criteria for matrix addressed alphanumerics which can be used to define limits in font variables for a matrix addressed format which is fail-safe and/or fail-redundant and self-healing. This can then be combined with hardware fail probabilities to predict useful life of new aircraft display systems.

Conduct a preliminary analysis based on the Riley and Barbato discrete element degradation experiments and on Euclidian distances from Goble. This effort will scope the modes and ranges of random and linear degradation to be experimentally evaluated. Define experiments, complete them and complete report establishing criteria.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0007, LOADS FACILITY EVALUATION
T.F. Sabick, U.S. Dept. of Defense, Air Force, Flight Dynamics Lab., *Wright Patterson A.F.B., Dayton, Ohio* 45433 (DF143810)

There is currently no facility in the free world in which the survivability of aircraft structures can be evaluated in a realistic flight loaded condition and subjected to actual ballistic impacts. This testing is necessary to determine the structural degradation of ballistically damaged aircraft components. The objective of this effort is to provide the on-site support necessary for the installation and initial evaluation of a flight load simulation system in the Aircraft Survivability Research Facility. The data produced in this effort will be used to improve the battle-damaged structure analysis code and thereby improve survivability design studies and vulnerability assessments.

The load reaction frame and associated instrumentation and control components that comprise the flight loads simulation system will be installed in the ASRF. Evaluation and checkout will be performed utilizing replica wing specimens. Of the five replica specimens that will be used, three will have structural members removed to simulate ballistic damage. When this initial evaluation stage is complete an actual A-10 aircraft wing will be installed and tested using a typical foreign anti-aircraft round as the threat. A detailed comparison between the battle damage structure analysis code prediction and the actual wing response will then be performed.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Flight Dynamics Lab.

1.0008, AIRCRAFT/STORE AERODYNAMIC HEATING
T.E. Durrenberger, U.S. Dept. of Defense, Air Force, Arnold Engineering Development Center, *Arnold Air Force Station, Tullahoma, Tennessee* 37389 (DF626610)

To develop an in-house capability for analytically predicting fields of aero-thermodynamic and transport properties required in aerodynamic heating analyses of USAF airframe/store bodies of concern to the AFATL, over existing/anticipated operational flight envelopes. These fields of properties, along with specific geometrical and thermal property specifications of the airframe/store bodies under consideration are required to determine transient thermal responses and steady state temperatures, i.e., temperature fields throughout the bodies.

Investigate existing capability for analytically predicting aerothermodynamic (velocities, viscosities, temperatures, etc.) and transport (effective convective heat transfer coefficients) air properties. Using these techniques, develop a method whereby fields of the above-mentioned properties may be predicted for surfaces of selected USAF airframe/store bodies over a range of flight envelopes. This effort is confined to the aero-thermodynamics of adiabatic compression and viscous heating-transient thermal responses of airframe/store bodies are not intended for inclusion hereunder.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Armament Lab.

CHEMISTRY AND MATERIALS

Includes Chemistry and Materials (general); Composite Materials; Inorganic and Physical Chemistry; Metallic Materials; Nonmetallic Materials; and Propellants and Fuels.

3.0001, CRYSTAL CHEMISTRY
M. O'Keeffe, Arizona State University, School of Liberal Arts, Dept. of Chemistry, *Tempe, Arizona* 85281 (DMR78-09197)

The ultimate goal of this project is to obtain an improved understanding of structure and bonding in inorganic solids. General structural and bonding principles are sought that will (a) enable one to rationalize and organize the enormous body of structural data already extant; (b) serve as guides to predicting the existence, structure, and properties of new inorganic solids; and, (c) help to integrate the chemistry of solids with the rest of inorganic chemistry. A major intermediate goal is obtaining a better understanding of the importance of cation-cation nonbonded interactions in determining crystal structure and stability. The program includes synthesis and structure determination of oxides and nitrides of beryllium, silicon, aluminum, gallium, and phosphorus. Included are ceramics of silicon, aluminum, oxygen and nitrogen (the 'sialon' refractories) that are important in high temperature and solar energy applications. The occurences of extended defects and ordered intermediate phases also are being explored in order to gain a fuller understanding of the structure, stability, and reactivity of these compounds.

Disorder in crystals is investigated with emphasis on sublattice melting. Finally, means of simplifying the descriptions of complicated crystal structures are being sought.

This is a continuation of work supported under DMR 72-03246. This is the first year of a three-year continuing grant.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Materials Research

3.0002, NONLINEAR ELECTROMAGNETIC SCATTERING TECHNIQUES FOR THE DETECTION AND CHARACTERIZATION OF CLOSED CRACKS
A.J. Bahr, S R I International, *333 Ravenswood Ave., Menlo Park, California* 94025 (DF053920; F49620-79-C-0005)

AF function - metal aircraft structures and turbine engine components are subject to failure by the growth of small cracks and defects introduced by fatigue and other deformation processes. Deficiency - fatigue commences immediately upon the fabrication and use of the metal article and there are inadequate nondestructive evaluation (NDE) techniques available to reject that component when catastrophic failure is imminent. Objective - the objective of this research is to develop an NDE technique capable of detecting small closed cracks on metal surfaces. How work contributes - detecting small cracks will allow parts to be rejected before catastrophic failure occurs.

Nonlinear interactions of microwave energy incident upon metal surfaces will be studied. The magnitude, source and mechanism of such interactions will be correlated with physical (strength-related) parameters of the metal surface. Closed surface cracks will be introduced, characterized and related to the nonlinear interactions in order to assess the utility of this technique for NDE applications.

SUPPORTED BY U.S. Dept. of Defense, Air Force, Office of Scientific Research

3.0003, MOLECULAR BEAM STUDIES OF TRANSLATIONAL TO VIBRATIONAL-ROTATIONAL ENERGY TRANSFER BETWEEN ATOMS AND MOLECULES
Y.T. Lee, University of California, Berkeley Campus, School of Letters & Science, Dept. of Chemistry, *Berkeley, California* 94720 (CHE75-20121 A02)

A specialized crossed molecular beam machine with a high resolution, high sensitivity velocity analyzer will be constructed and used for the investigation of energy transfers between atoms and molecules.

The new velocity analyzer is based on the detection of metastable rare gas atoms rather than ions. The high sensitivity, high resolution and low background are accomplished in the time-of-flight velocity analysis by decoupling the gating and excitation processes.

With this new machine, anisotropy of interaction potential will be investigated from the differential rotational excitation cross-sections as well as the translational to vibrational-rotational energy transfer processes between rare gas atoms and polyatomic molecules.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0004, SPECTROSCOPIC STUDIES OF MOLECULAR RELAXATION KINETICS

G.W. Scott, University of California, Riverside Campus, School of Natural & Agricultural Sciences, Dept. of Chemistry, *Riverside, California* 92502 (CHE76-01318 A02)

Dr. Scott will experimentally study radiationless transitions subsequent to excitation of specific vibronic and ground state vibrational levels of small aromatic molecules in macroscopically homogeneous samples. He will use the techniques of picosecond spectroscopy to monitor the molecular relaxation phenomena. He plans to obtain detailed kinetic behavior of specific excited states on the picosecond time scale and measure, in contrast to previous work, all competitive relaxation processes including intersystem crossing, internal conversion, vibrational relaxation, and fast photochemistry. This detailed kinetic information will test basic theoretical understanding of these processes and provide insight into these processes in more complex systems. New picosecond laser techniques will be used to accomplish these goals.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0005, THEORETICAL STUDIES OF SCATTERING DYNAMICS AND INTERMOLECULAR FORCES

H.S. Taylor, University of Southern California, School of Letters Arts & Sciences, Dept. of Chemistry, *3551 University Ave., Los Angeles, California* 90007 (CHE76-15656 A02)

Taylor plans to pursue a broad program of research in atomic and molecular physics and chemistry. Areas of interest include: (1) extensions of many-body theory to new problems concerning electron impact ionization, inelastic scattering and elastic scattering; (2) the use of many-body effective potentials in the calculation of intermolecular forces and in pseudopotentials for two electrons; (3) studies of molecular systems that dissociate to states of atoms or ions with very short lifetimes; and (4) development of a classical method for simulation of quantum atom molecule scattering problems. This work is a continuation of that currently supported by Foundation grant GP-30710X.

SUPPORTED BY U.S. National Science Foundation, Directorate for Mathematical & Physical Sciences, Div. of Chemistry

3.0006, SURVEILLANCE - BEHAVIOR OF INORGANIC MOLECULAR SOLIDS SUBJECTED TO MAGNETIC FIELDS AND TO LIGHT

E.R. Bernstein, Colorado State University, School of Science, Dept. of Chemistry, *Fort Collins, Colorado* 80523 (DN675016; N00014-75-C-1179)

Solid state devices such as transistors and radiation detectors are widely used in the Navy in communication, energy conversion, and surveillance. Molecular crystals, such as the inorganic molecular crystals to be investigated here, interact strongly with light and with magnetic fields and are therefore excellent candidates for use in solid state devices. It is the purpose of this research to investigate the interactions among the molecules and the energy transfer processes in inorganic molecular crystals with a view toward producing improved solid state devices.

Optical and zero field paramagnetic resonance techniques are being used in an investigation of intermolecular interactions, energy transfer mechanisms, and exciton kinetics in inorganic molecular crystals. environmental effects on molecular energy levels within the crystals will be characterized. The molecules chosen for investigation include rare earth and actinide borohydrides and borazine (which has physical properties similar to those of benzene). A low temperature, high resolution zero field paramagnetic resonance investigation of ground and excited states of f electron crystals will be carried out.

SUPPORTED BY U.S. Dept. of Defense, Navy, Office of Naval Research

3.0007, MAGNETIZATION OF THIN MAGNETIC FILMS

D.B. Dove, State University System of Florida, University of Florida, School of Engineering, Dept. of Materials Science & Engineering, *220 Black Hall, Gainesville, Florida* 32611 (ENG76-24176)

This program is concerned with the investigation of the magnetization response of thin permalloy film segments of interest in connection with magnetic bubble propagation and logic circuits. The approach to be taken is both theoretical and experimental. The analytical method of analyzing film bar segments using a series formulation to solve the shape demagnetizing field problem will be extended to a variety of circuit element shapes. Measurements will be made using domain observations and using a small spot Kerr effect probe. Of particular concern is the resolution of the question whether it is valid to treat the magnetic material simply as a magnetic continuum or whether domain structure must be explicitly taken into account in evaluating film response to applied fields or bubble fields.

SUPPORTED BY U.S. National Science Foundation, Directorate for Engineering & Applied Science

3.0008, BROMINE REACTIONS OF ATMOSPHERIC INTEREST

M. Kaufman, Emory University, School of Arts & Sciences, Dept. of Chemistry, *1364 Clifton Rd. N.E., Atlanta, Georgia* 30322 (ATM77-16673)

Because of the relatively weak bond of HBr, very little atmospheric bromine exists in this form. As a result, tropospheric washout of bromine is relatively inefficient, and compared to chlorine, bromine shows enhanced transport to the stratosphere. Stratospheric bromine is a very efficient ozone-removing catalyst, also due to its reduced tendency to form non-catalytically active HBr. In order to better evaluate the effect of Br on the stratospheric ozone layer, this research will measure, in the laboratory, rate constants of a number of reactions important in the bromine catalytic cycle. These include Br plus O3 yields BrO plus O2, the basic ozone-removing reactions and Br plus H2O2 yields HBr plus HO2 and Br plus HO2 yields HBr plus O2, probably the two most important HBr-forming reactions. These measurements will be performed over the temperature range of interest for stratospheric computer modeling, namely 200-300 degrees K.

SUPPORTED BY U.S. National Science Foundation, Directorate for Astronomical Atmospheric Earth & Ocean Scis., Div. of Atmospheric Sciences

3.0009, STABLE ISOTOPE FRACTIONATION IN NATURE

R.N. Clayton, University of Chicago, School of Physical Sciences, Dept. of Chemistry, *5734 S. Ellis Ave., c/o Hinds Geophysics Lab., Chicago, Illinois* 60637 (EAR74-19038 A03)

This is a continuation of research supported under NSF grant GA-22711 and Amendment #1.

This project involves measurement of the isotopes of oxygen and other elements in natural materials. Specific projects include: (1) oxygen in meteorites; (2) oxygen in terrestrial sediments; (3) nitrogen isotopes in meteorites and terrestrial rocks;

(4) laboratory measurement of isotopic fractionation at high temperatures. The results will be applicable to a wide variety of important geological problems including: chemical processes during formation of the solar system; sources, materials, and formation of terrestrial shales and deep-sea sediments; significance of nitrogen in geological processes; and accurate measurement of the temperatures of formation of terrestrial rocks.

3.0010, MAGNETIC, SPECTROSCOPIC, AND ELECTRICAL PROPERTIES OF MOLTEN SALTS

N.H. Nachtrieb, University of Chicago, School of Physical Sciences, Dept. of Chemistry, *5734 S. Ellis Ave., c/o Hinds Geophysics Lab., Chicago, Illinois* 60637 (CHE78-12487)

This project is in the Structural Chemistry and Thermodynamics program, in the subarea of properties of the liquid state. The Principal Investigator will study solutions of metals in molten salts in order to improve our understanding of electrons in dielectric media, and the nature of the metal-insulator transition. The techniques to be used include magnetic susceptibility, electron spin resonance, vapor pressure measurement, optical spectroscopy, nuclear resonance, and thermoelectric power measurements. The measurements will be made as a function of metal concentration, to vary the electron density, and will be used to test current views of electronic behavior and electronic states in disordered systems.

This research is a continuation of that currently supported by Foundation Grant, CHE-7500680.

SUPPORTED BY U.S. National Science Foundation,
Directorate for Mathematical & Physical
Sciences, Div. of Chemistry

3.0011, QUANTUM MECHANICAL STUDIES OF THE COUPLING BETWEEN ELECTRONIC AND VIBRATIONAL STATES

R.J. Silbey, Massachusetts Inst. of Technology, School of Science, Dept. of Chemistry, *77 Massachusetts Ave., Cambridge, Massachusetts* 02139 (CHE78-07515)

Professor Silbey will conduct research aimed at increasing theoretical understanding of processes involving interactions of solids with energy or of solid surfaces with molecules.

Research in molecular energy transfer in solids will focus on development of the theory of energy transport, including coupling between vibrational modes, vibrational relaxation, and many trapping sites. Problems to be treated are (a) the derivation of macroscopic equation governing transport from microscopic models; (b) the inclusion of both acoustic and optical modes; (c) the possibility of 'hot' transport; (d) the description of experiments on energy transport in highly mixed crystals.

In research on interactions between high and low frequency modes, Professor Silbey will apply his theories on exciton-vibration and electron-vibration coupling to the study of excited state Jahn-Teller systems which are coupled to other electronic states.

Studies will be made of models of adsorption, particularly on the effects of a nearby metal surface on the interaction between atoms. The angular dependence of the potential between linear or planar molecules and metal surfaces will be examined theoretically. Self-consistent calculations will be made of work function and surface dipole barriers and the effects of steps and ledges on electronic densities near surfaces.

This grant renews support of a research program currently supported under NSF Grant CHE-7508184.

Sciences, Div. of Chemistry

3.0012, HIGH-RESOLUTION PROFILING AS A MEANS OF STUDYING FUNDAMENTAL PARAMETERS IN THE INDUCTIVELY COUPLED PLASMA

S.R. Koirtyohann, University of Missouri, Columbia Campus, School of Arts & Sciences, Dept. of Chemistry, *130 Jesse Hall, Columbia, Missouri* 65201 (CHE77-22915 A01)

Dr. Koirtyohann is studying emissions from the various regions of the inductively-coupled plasma (ICP) to understand some of the fundamental parameters involved in its operation. Although this plasma is rapidly becoming an important and analytically useful spectroscopic source, very little is known about its mechanism of operation or about the reactions undergone by analyte or sample matrix in the various regions of the plasma. Detailed profiling of atomic, ionic, and molecular emissions of the ICP will allow the full analytical potential of this source to be realized and many pitfalls in methods of development to be avoided.

Dr. Koirtyohann is using an improved method for source profiling recently developed in his laboratory which consists of a photo-diode array placed vertically near the exit slit of a stigmatic monochromator to produce a profile at a given wavelength for a complete horizontal or vertical section of the source. The resolution is better than 0.1 mm and the measurement can be made in a matter of minutes.

This profiling method is being used to study zones of intense emission, atomization and ionization processes, and distributions of temperature, analyte, and electron density within the plasma.

Sciences, Div. of Chemistry

3.0013, LABORATORY AND OBSERVATIONAL SPECTROSCOPIC STUDIES OF MOLECULES AND PROCESSES OF ASTROPHYSICAL INTEREST

W.H. Smith, Washington University, School of Arts & Sciences, Dept. of Chemistry, *4559 Scott Ave., St. Louis, Missouri* 63130 (AST78-12799)

This research is aimed at the elucidation and discovery of molecular spectra of species known or believed to be of substantial importance in a number of astrophysical objects, including the atmospheres of the major planets (e.g., CH4, NH3, and H2) and the diffuse interstellar clouds and comets (e.g. CH2 ion, HeH ion, H2O ion, and H3O ion). The stable species will be investigated with laser photoacoustic spectroscopy at high spectral resolution and S/N using as little as 10 to the minus 4th power of the material required by conventional methods. The spectra of the molecular ions will be investigated with laser methods, using in some cases Fourier transform spectrometers. Great sensitivity is achieved by these methods, with estimated levels of 10 to the 2nd power to 10 to the 6th power species per cc being detectable. This research represents a continuation of that currently supported by Foundation Grant AST 77-06050.

3.0014, AB INITIO CALCULATIONS OF MOLECULAR ENERGY SURFACES

G.A. Gallup, University of Nebraska, Lincoln Campus, School of Arts & Sciences, Dept. of Chemistry, *Lincoln, Nebraska* 68508 (CHE76-17567 A01)

Gallup and coworkers will calculate molecular potential energy surfaces using an ab initio modified valence bond procedure. Initial emphasis is on determining nonreactive region interactions of H2-F, a system important in chemical laser research. Extension of these calculations to include the systems H2-C, H2-N, H2-O, and H2-S will provide information bearing upon astrophysical problems. In addition to studies on these triatomic systems, previous H2-H2 calculations will be extended to regions governing vibrational excitations. Longer range plans include calculations of H2-F in reactive regions.

The investigators are examining the use of the Hellman-Feynman theorem to improve the efficiency of energy surface calculations. Gradients in the energy calculated with this theo-

rem can, in ideal cases, provide information for use in conjunction with energies for the accurate determination of analytic representations of surfaces.

This research will provide accurate, analytic energy surfaces for molecular dynamics calculations, as well as produce useful qualitative insights into the nature of interacting systems and their wave functions.
